Re: Request for Approval of Pre-Filing Review  
Algonquin Gas Transmission, LLC–AIM Project  
Docket No. PF13-\_\_\_\_-000

Dear Ms. Bose:

Pursuant to Section 157.21(b) of the regulations of the Federal Energy Regulatory Commission ('FERC' or 'Commission'),<sup>1</sup> Algonquin Gas Transmission, LLC ('Algonquin') hereby requests approval from Commission Staff to initiate the Pre-Filing Review Process for the proposed Algonquin Incremental Market Project ('AIM Project' or 'Project'). Upon completion of the Pre-Filing Review, Algonquin will file an application with the Commission for authorization to construct the Project under Section 7(c) of the Natural Gas Act ('NGA').<sup>2</sup> Representatives of Algonquin met with Commission Staff on June 4, 2013 to discuss the Project and Algonquin's use of the Pre-Filing Review Process. This Project is designed to deliver critically needed natural gas supplies that will meet immediate and future supply and load growth requirements in the Northeast market area. The target in-service date for the AIM Project is November 1, 2016.

**Project Overview**

The AIM Project will create additional firm pipeline capacity necessary to deliver 433,000 dekatherms per day ('Dth/d') of natural gas to the Northeast market area. The Project will create additional capacity between a receipt point at Ramapo in Rockland County, NY and Algonquin city gate delivery points.

Algonquin held an open season for the AIM Project from September 20, 2012 through November 2, 2012 ('2012 Open Season'). A supplemental open season and a reverse open season will be held concurrently by Algonquin from June 11, 2013 through June 25, 2013 to allow for potential shippers to bid for the remaining project capacity and allow Algonquin to consider the turnback of capacity by current firm shippers to reduce the scope of Algonquin's facility requirements for the AIM Project. As a result of the 2012 Open Season, Algonquin has executed precedent agreements with four (4) shippers for service on the Project facilities. The shippers, Yankee Gas Services Company, NSTAR Gas Company, Connecticut Natural Gas and Southern

<sup>1</sup> 18 C.F.R. § 157.21(b) (2013).

<sup>2</sup> 15 U.S.C. §§ 717f(b) and 717f(c) (2006).

Ms. Kimberly D. Bose, Secretary

June 18, 2013

Page 2

Connecticut Gas collectively, the (Project Shippers), have entered into commitments for firm transportation service. Placing the Project facilities in service by November 1, 2016 will allow the Project Shippers to receive service by the timing contemplated in the precedent agreements for the Project.

Demand for natural gas is growing in the Northeast as the region seeks to grow its economy by using an economic source of fuel that is domestically produced, clean burning and efficient. Demand in the region is expected to continue to increase as more homes convert home heating units and appliances to natural gas and as natural gas utilization increases for electric generation.

In recognition of this opportunity The Connecticut Department of Energy and Environmental Protection recently issued a Comprehensive Energy Strategy (‘CES’) that includes specific recommendations for increasing the use of natural gas in Connecticut. The CES notes that “only 31% of Connecticut homes heat with gas today” and “proposes to make gas available to as many as 300,000 additional Connecticut homes and businesses.” Similar to Connecticut, less than 50% of the homes in Rhode Island and Massachusetts utilize natural gas for home heating. Converting home heating units and other appliances to natural gas represents a substantial source of growth in the region, and capacity commitments by local distribution companies (‘LDCs’) in the AIM Project confirms the need for new pipeline infrastructure to support this growth. The current project shippers are all LDCs. While natural gas is becoming an increasingly important fuel for electric generation in the region, to date no commitment by the electric market has been made to the AIM project. However, Algonquin will be holding a supplemental open season this month to allow bids for the remaining AIM capacity from any interested parties, including electric market participants. To the extent additional market support is not identified by August, 2013, Algonquin will revise its facility requirements to bring them into alignment with the identified level of market support.

Algonquin respectfully requests that the Commission approve this request by June 26, 2013, to initiate the Pre-Filing Review Process. As demonstrated herein, Algonquin has engaged in extensive efforts in anticipation of filing its certificate application to ensure that the Project adheres to the timeline discussed below and meets the November 1, 2016 target in-service date. To further support its request, Algonquin submits the following in compliance with the Commission’s regulations in Section 157.21(d) and Commission Staff’s guidance for initiating the Pre-Filing Review Process.

***1. A description of the schedule desired for the project including the expected application filing date and the desired date for Commission approval.***

To meet the target in-service date of November 1, 2016 for the Project, Algonquin requests that the Director of the Office of Energy Projects issue a notice approving use of the Pre-Filing Review Process by June 26, 2013. Algonquin intends to submit an initial draft of Environmental Resource Report No. 1 and a draft alternatives analysis 30 days after the Pre-Filing docket number being issued, and a draft of all Environmental Resource Reports no later than October 25, 2013. Algonquin plans to request receipt of Commission Staff’s comments on those draft Environmental Resource Reports no later than December 20, 2013. Algonquin anticipates submitting the certificate application for the Project no later than February, 2014.

Ms. Kimberly D. Bose, Secretary

June 18, 2013

Page 3

Algonquin is committed to addressing environmental and landowner concerns as part of the Pre-Filing Review Process and requests issuance of a final environmental document no later than November 1, 2014 and a certificate order no later than January 31, 2015.

Adhering to this timeline will allow for receipt of any remaining applicable permits and authorizations necessary for Algonquin to begin pre-construction activities, including the orderly mobilization of contractors and materials and the resolution of any outstanding landowner issues, and allow for construction during the traditional construction season (March-October), starting with the initial stages of construction in March 2015. Timely commencement of these activities in early 2015 is critical to ensure the Project facilities are placed into service by November 1, 2016.

***2. Explain why the project sponsor needs/wants to participate in the pre-filing process.***

Algonquin is seeking authorization to use the Pre-Filing Review Process to provide the necessary environmental information to Commission Staff for review at the earliest practicable time in order to expedite the processing of Algonquin's certificate application.

Use of the Pre-Filing Review Process will benefit Algonquin, interested federal, state, and local agencies, and other stakeholders by:

- Assisting in the development of initial information about the Project and identifying affected parties;
- Facilitating issue identification and resolution;
- Providing a process that accommodates site visits, meetings with federal, state, and local agencies and stakeholders, participation in public information meetings (e.g., open houses), and the examination of alternatives;
- Providing interested federal, state, and local agencies and stakeholders with access to draft Environmental Resource Reports and other Project-related information;
- Minimizing the number of Commission Staff environmental data requests and subsequent filings;
- Maintaining a coordinated schedule for a thorough environmental impact review; and
- Facilitating preparation of Environmental Resource Reports and other related documents.

***3. Provide a detailed description of the project, including location maps and plot plans to scale showing all major plant components.***

The Project will consist of the following facilities:

- (i) Construction of approximately 25.5 miles of mainline pipeline, comprised of the following:
  - a. 3.3 miles removal and replacement of 26-inch pipeline with 42-inch pipeline in Rockland County, New York upstream of Algonquin's existing Stony Point Compressor Station;
  - b. 15.8 miles removal and replacement of 26-inch pipeline with 42-inch pipeline (including a new 1.1 mile 42-inch Hudson River crossing) in Rockland

Ms. Kimberly D. Bose, Secretary

June 18, 2013

Page 4

- County, New York and Westchester County, New York downstream of Algonquin's existing Stony Point Compressor Station;
  - c. 4.4 miles removal and replacement of 26-inch pipeline with 42-inch pipeline in Putnam County, New York and Fairfield County, Connecticut downstream of Algonquin's existing Southeast Compressor Station; and
  - d. 2.0 miles 36-inch pipeline loop extension in Middlesex County, Connecticut and Hartford County, Connecticut downstream of Algonquin's existing Cromwell Compressor Station.
- (ii) Construction of approximately 18.0 miles of lateral pipeline, comprised of:
- a. 9.1 miles removal and replacement of 6-inch pipeline with 16-inch pipeline on Algonquin's existing E-1 System in New London County, Connecticut;
  - b. 2.4 miles 12-inch pipeline loop on Algonquin's existing E-1 System in New London County, Connecticut;
  - c. 1.6 miles of 12-inch pipeline loop on Algonquin's existing G-2 System in Newport County, Rhode Island; and
  - d. 4.9 miles of new 16-inch pipeline off of Algonquin's existing I-4 System in Norfolk County, Massachusetts and Suffolk County, Massachusetts.
- (iii) Construction at six existing Algonquin Compressor Stations for an additional 79,780 horsepower (hp), comprised of the following:
- a. Install one (1) Solar Mars 100 (15,900 hp) gas-fired compressor unit and one (1) Solar Centaur 50 (6,300 hp) gas-fired compressor unit at Algonquin's existing Stony Point Compressor Station in Rockland County, New York;
  - b. Restage two (2) existing Solar Taurus 60 (7,700 hp) gas-fired units (C5 and C6) at Algonquin's existing Stony Point Compressor Station in Rockland County, New York;
  - c. Upgrade one (1) existing Solar Mars 90 (12,600) hp gas-fired compressor unit (C7) to 15 NO<sub>x</sub> parts per million (ppm) resulting in a 13,220 hp unit (additional 620 hp) at Algonquin's existing Stony Point Compressor Station in Rockland County, New York;
  - d. Install one (1) Solar Mars 90 (13,220 hp) gas-fired compressor unit at Algonquin's existing Southeast Compressor Station in Putnam County, New York;
  - e. Restage one (1) existing Solar Taurus 60 (7,700 hp) gas-fired unit (C5) and one (1) existing Solar Taurus 70 (10,915 hp) gas-fired unit (C4) at Algonquin's existing Southeast Compressor Station in Putnam County, New York;
  - f. Replace compressor body and upgrade one (1) existing Solar Mars 90 (12,600 hp) gas-fired compressor unit (C3) to 15 NO<sub>x</sub> ppm resulting in a 13,220 hp unit (additional 620 hp) at Algonquin's existing Southeast Compressor Station in Putnam County, New York;
  - g. Install one (1) Solar Centaur 50 (6,300 hp) gas-fired compressor unit at Algonquin's existing Oxford Compressor Station in New Haven County, Connecticut;

Ms. Kimberly D. Bose, Secretary

June 18, 2013

Page 5

- h. Install one (1) Solar Mars 100 (15,900 hp) gas-fired compressor unit at Algonquin's existing Cromwell Compressor Station in Middlesex County, Connecticut;
- i. Install one (1) Solar Taurus 60 (7,700 hp) gas-fired compressor unit at Algonquin's existing Chaplin Compressor Station in Windham County, Connecticut; and
- j. Install one (1) Solar Mars 90 (13,220 hp) gas-fired compressor unit at Algonquin's existing Burrillville Compressor Station in Providence County, Rhode Island.

(iv) Construction at Algonquin meter stations, comprised of the following:

- a. Install over pressure protection ("OPP") at 5 existing meter stations;
- b. Construct 3 new meter stations; and
- c. Additional capacity required for 25 existing meter stations.

Please see Attachment 1 for USGS Quadrangle maps depicting the location of Project facilities. The attached maps identify the currently preferred route, which incorporates information gathered during document reviews, field work, and consultation and feedback from impacted landowners, agencies, government officials, and other interested stakeholders. These outreach efforts are documented in attachments discussed further in this letter.

In accordance with the Pre-Filing Review Process, Algonquin is committed to continuing review of the route alignment with stakeholders and working to accommodate their concerns. As Algonquin continues these ongoing efforts to refine the route alignment, updates to the maps will be submitted to Commission Staff.

***4. Provide a list of the relevant federal and state agencies in the project area with permitting requirements. The filing shall include a statement indicating: (i) that those agencies are aware of the prospective applicant's intention to use the pre-filing process; (ii) whether the agencies have agreed to participate in the process; (iii) how the applicant has accounted for agency schedules for issuance of federal authorizations; and (iv) when the applicant proposes to file with these agencies for their respective permits or other authorizations.***

Algonquin began contacting federal and state regulatory agencies in New York, Connecticut, Rhode Island and Massachusetts in May 2013 to discuss the relevant permitting requirements for the AIM Project. Algonquin provided preliminary information regarding the Project, including a Project description and USGS 7.5-minute quadrangles, and advised these agencies of Algonquin's intent to use the Pre-Filing Review Process. A listing of the federal and state agencies that Algonquin has contacted to date is included as Attachment 2. Included, as Attachment 3, is a list of anticipated environmental permits, reviews, and consultations.

Agencies contacted to date have requested additional information prior to committing to participate in the Pre-Filing Review Process. As Algonquin continues its outreach efforts and participates in meetings with the key permitting agencies anticipated in June 2013, Algonquin will request that each federal and state agency agree to participate in the Pre-Filing Review Process and will report that information to the Commission as it becomes available. Algonquin expects to file for the federal and the majority of the state authorizations at the same time as or

prior to submitting its certificate application to the Commission, consistent with Order No. 687,<sup>3</sup> and Algonquin will work with Commission Staff and the affected federal and state agencies to develop a schedule for issuance of applicable environmental clearances and approvals. Algonquin will continue its efforts to contact federal and state agency representatives during the Pre-Filing Review Process and will submit updates to Attachments 2 and 3 to Commission Staff accordingly.

***5. Detail other interested persons and organizations that have been contacted about the project.***

Algonquin began advising potential stakeholders, government officials, and other interested persons in February 2013 about the AIM Project through letters and individual meetings. Algonquin has contacted officials at the federal, state, and local governments, including congressional delegations, state legislators, county commissioners, and local elected officials.

A listing of government officials is included as Attachment 4. Algonquin will continue its ongoing efforts to identify and contact other potential stakeholders and interested persons, updates to Attachment 4 will be submitted to Commission Staff accordingly.

***6. Detail what work has been done already, i.e. landowner contacts, agency consultations, engineering and route planning.***

*Landowner contacts:* The proposed Project facilities will affect limited portions of Rockland, Putnam and Westchester Counties, New York; New Haven, Windham, Fairfield, Middlesex, Hartford, Tolland and New London Counties, Connecticut; Providence and Newport Counties, Rhode Island; and Norfolk, Bristol, Middlesex, Plymouth and Suffolk County, Massachusetts. The proposed Project will directly affect approximately 462 landowners or 572 tracts along the pipeline portion. To date, these landowners have been contacted multiple times by Algonquin. These communications have included a Project introduction, a letter requesting survey permission, individual discussions with Algonquin's representatives, and site visits. To date, Algonquin has been granted survey permission on 763 tracts which constitutes 86 percent of the proposed Project right-of-way for which Algonquin needs survey authorization. There were seventy-six (76) abutters to Algonquin's six (6) Compressor Stations proposed for modifications that received Project notifications but were not asked for survey permission because there were no Project survey activities being planned at those facilities. Initial field surveys are in-progress and are scheduled to be completed in September, 2013.

In April and May 2013, Algonquin hosted twelve (12) landowner informational meetings for affected landowners in the Pomona, Stony Point, Shenorock, Yorktown Heights, Bear Mountain and Cortlandt Manor areas of New York; the Lebanon, Cromwell, Southbury and Danbury areas of Connecticut; and the Harrisville and Little Compton areas of Rhode Island. Additional landowner informational meetings will be conducted in July-August 2013 timeframe.

---

<sup>3</sup> *Regulations Implementing the Energy Policy Act of 2005; Coordinating the Processing of Federal Authorizations for Applications under Sections 3 and 7 of the Natural Gas Act and Maintaining a Complete Consolidated Record*, 117 FERC ¶ 61,076 (2006) ("Order No. 687").

Ms. Kimberly D. Bose, Secretary

June 18, 2013

Page 7

Impacted landowners and abutters were mailed notices inviting them to attend the respective meetings. The meetings were set up as open houses with subject matter experts available for construction, environmental, regulatory, government relations, stakeholder outreach and right-of-way. Alignment sheets identifying impacted tracts by landowner were available to allow for site specific discussions between right-of-way agents and interested stakeholders. Attendees asked various questions about the Project scope, schedule, noise, and safety as well as tract specific questions concerning Project impacts.

*Agency consultations:* Algonquin initiated consultation with the applicable federal and state resource and permitting agencies on May 17, 2013. Included in the outreach were the United States Army Corps of Engineers ('USACE') (New England and New York Districts), the United States Fish & Wildlife Service ('USFWS') (New York Field Office and New England Field Office), the National Marine Fisheries Service ('NMFS') Northeast Regional Office, the New York State Department of Environmental Conservation ('NYSDEC'), the Connecticut Department of Energy and Environmental Protection ('CTDEEP'), the Rhode Island Department of Environmental Management ('RIDEM'), the Massachusetts Executive Office of Energy and Environmental Affairs ('EOEA'), and the Massachusetts Department of Environmental Protection ('MassDEP').

*Project Engineering and Route Planning:* Algonquin has defined the facilities required to provide the transportation services associated with the Project Shippers' commitments. The facilities primarily involve pipeline looping generally adjacent to existing pipeline, therefore minimal route planning was required. Further, all of the new compression and other compressor station modifications and minor facility modifications for the required uprates will be within the fence line of existing facilities, with the possible exception of additional temporary workspace needed during construction. Civil surveys commenced on April, 2013 and are ongoing. Right-of-way workspace configurations will be further refined, as necessary, based on input from landowners, agencies, public officials and other stakeholders, as well as information obtained from field surveys. These activities will continue throughout the Pre-Filing Review Process.

*Contractor Engagement:* Algonquin and its in-house engineering group have been working with the following contractors to perform various engineering and project studies:

- Hatch Mott MacDonald: Complete civil survey and assist Algonquin with project design and engineering;
- TRC Environmental ('TRC'): Prepare Environmental Resource Reports and obtain environmental permits & clearances;
- Public Archaeological Laboratory ('PAL'): Prepare cultural resource reports and obtain Project clearances;
- Trinity Consultants: Prepare air quality permit applications; and
- Hoover & Keith: Prepare noise section of Environmental Resource Report No. 9.

*Environmental and Cultural Surveys:* The wetland delineation and cultural resources field surveys for the Project commenced in April, 2013.

Ms. Kimberly D. Bose, Secretary

June 18, 2013

Page 8

Algonquin has initiated informal consultations with federal and state agencies. Certain federal and state-listed species have been identified as potentially occurring in the vicinity of the Project facilities, including:

- Indiana bat (endangered)—New York and Connecticut;
- New England Cottontail Rabbit (candidate)—New York;
- Bog-turtle (endangered)—New York and Connecticut; and
- Short-nosed Sturgeon and Atlantic Sturgeon (endangered)—Hudson River, New York.

Algonquin will continue to consult with federal and state agencies on any required species-specific biological surveys for the Project.

*Next Steps:* Upon approval from the Commission to use the Pre-Filing Review Process, Algonquin will distribute letters to stakeholders that will include information about the FERC Pre-Filing Review Process as well as a detailed description of Project facilities and maps (*i.e.*, USGS 7.5-minute quad based figures), similar to the information provided to the governmental agencies described in response to Item 4. Algonquin will continue to update stakeholders with mailers and will also post information on its company website at [www.spectraenergy.com](http://www.spectraenergy.com) under ‘New Projects and Our Growth Process—New Project in U.S.’

***7. Propose at least three prospective third-party contractors from which the Commission Staff may make a selection to assist in the preparation the requisite NEPA document, or a proposal for the submission of an applicant-prepared draft Environmental Assessment as determined during the initial consultation.***

Algonquin prepared a Request for Proposal (‘RFP’) for a third party contractor to prepare environmental documents. The draft RFP was reviewed by FERC Staff and issued to five prospective contractors. While three firms were unable to participate in the RFP process due to conflicts, two firms submitted proposals on June 18, 2013. Algonquin has provided herewith in Attachment 5 the two contractor proposals to the Commission for its consideration.

***8. Acknowledge that a complete Environmental Report and complete application are still required at the time of filing.***

Algonquin acknowledges that a complete Environmental Report and a complete application under Section 7 of the NGA are still required for the Project and will be submitted to the Commission.

***9. Detail a Public Participation Plan, which identifies specific tools and actions to facilitate stakeholder communications and public information, including establishing a project website and a single point of contact.***

Algonquin has developed a comprehensive Public and Agency Participation Plan that outlines a commitment to engage actively with stakeholders throughout the life cycle of the Project and provides the steps Algonquin has identified to ensure successful ongoing communication with stakeholders, including establishing a Project website and a single point of

***9. Detail a Public Participation Plan, which identifies specific tools and actions to facilitate stakeholder communications and public information, including establishing a project website and a single point of contact.***

Algonquin has developed a comprehensive Public and Agency Participation Plan that outlines a commitment to engage actively with stakeholders throughout the life cycle of the Project and provides the steps Algonquin has identified to ensure successful ongoing communication with stakeholders, including establishing a Project website and a single point of contact. Algonquin will continue to meet with Project stakeholders to discuss the ongoing efforts associated with the Project.

The Executive Summary to Algonquin's Public and Agency Participation Plan is included as Attachment 6. Additional details regarding the Public and Agency Participation Plan will be provided in future filings.

In conclusion, Algonquin believes use of the Pre-Filing Review Process will allow for active participation by interested stakeholders early on in the Project development process while maintaining a coordinated schedule throughout the review process. Algonquin is committed to identifying and resolving stakeholder issues or concerns regarding the proposed AIM Project at the earliest practicable stage of the Project.

Algonquin appreciates the assistance of Commission Staff in initiating the Pre-Filing Review Process and ensuring a thorough and timely analysis of the AIM Project, thereby allowing Algonquin to meet the service needs and timing requirements of the Project Shippers.

Should you have any questions concerning this request, please contact me at (713) 627-4488 or Chris Harvey at (713) 627-5113.

Sincerely,

Berk Donaldson

<b>STATE OF RHODE ISLAND</b>		
<b>Rhode Island Department of Environmental Management (RIDEM) Office of Water Resources</b> 235 Promenade Street Providence, RI 02908-5767  Terry Walsh, 401 Coordinator 401-222-4700 ext. 7243  Chuck Horbert, Supervisor Freshwater Wetlands 401-222-4700 ext. 7402  Eric Beck, RIPDES 401-222-4700 ext. 7202	<b>Required Permit</b> <ul style="list-style-type: none"> <li>Water Quality Certification pursuant to section 401 of the CWA; RIDEM Water Resources (chapter 46-12 of the General Laws of Rhode Island.)</li> </ul>	May 30, 2013 - Contacted Terry Walsh regarding Section 401 coordination. Based on preliminary review of mapping, it appears that the project will fall entirely within Freshwater Wetlands jurisdiction. Terry requested we overlay CRMC boundaries to determine what agency will take lead role in reviewing project. She also noted that if the USACE processes the project under an Individual Permit, the RIDEM office still needs to sign off on the impacts, so close coordination is required. It was also agreed that USGS mapping would be sent to her with background information. Mapping was sent same day.
	<b>Required Permit</b> <ul style="list-style-type: none"> <li>RIPDES Notice of Intent - Storm Water General Permit for Construction Activity</li> </ul>

Rachel indicated that as long as the project did not need a Variance from the Wetlands Protection Act, the project would be handled by her office. It was agreed that a pre-application meeting at this early stage was not warranted, but would be after field work was completed later this summer. She also suggested early consultation with the Charles River Watershed Associated should tributaries to the Charles River be crossed. It was also agreed that USGS mapping would be sent to her with background information. Mapping was sent same day.

### Stakeholder Outreach Program

## Stakeholder Outreach Program

### **Algonquin Incremental Market Project Stakeholder Outreach Program Executive Summary**

Prior to the submission of its request for authority to initiate the Federal Energy Regulatory Commission's (FERC) Pre-Filing Process (Pre-Filing Letter), Spectra Energy's Algonquin Gas Transmission, LLC (Algonquin) implemented a comprehensive stakeholder outreach program in an effort to identify and potentially resolve issues raised by stakeholders with regard to the Algonquin Incremental Market Project (Project). In furtherance of the Applicant's solid track record of safe and environmentally responsible operations, the Project's team members reached out to public and governmental stakeholders as the Project's scope evolved in order to solicit their input to help inform facility design.

Pursuant to the Project's Public and Agency Participation Plan, representatives of Algonquin Gas Transmission began contacting governmental stakeholders in February 2013, in advance of landowner notifications, and well in advance of the submission of the Pre-Filing Letter. Recognizing that the Project's stakeholder outreach program will continue beyond the conclusion of the Project's construction activities, some key components include:

- Notification of state, municipal, and county officials, and state legislative and congressional delegation members in advance of or contemporaneous with notification of affected landowners in order to ensure that interested stakeholders have timely access to Project information;
- Coordination among specialists within the Project team to facilitate information exchange and dissemination to interested stakeholders; and
- Ongoing communication with interested stakeholders in order to finalize facility designs.

The Project, an infrastructure investment that expands the pipeline capacity of the existing Algonquin system, will allow abundant, domestic natural gas supplies from the Appalachian basin to flow reliably into the Northeast, helping to meet the increasing demand from home heating and electric generation while lowering energy costs.

The Project will affect landowners because it requires construction of approximately 25.5 miles of mainline pipe; construction of 18.0 miles of lateral pipeline; modifications to existing compressor stations located in New York, Connecticut and Rhode Island; modifications to existing meter stations located in New York, Connecticut and Massachusetts; and construction of three new meter stations. The Project facilities will be constructed largely within Algonquin's current footprint to minimize impacts to landowners, communities and the environment.

Algonquin is utilizing the aforementioned components of its outreach program to inform stakeholders of the proposed scope leading up to the submission of the Pre-Filing Letter.

### **1. Single Point of Contact to Ensure Consistent Message**

Since April 2013, the Applicant has had in place a dedicated a 24 hour toll-free telephone number, (866) 873-2579, for the Project which is staffed by a representative located in the Applicant's Cheshire, Connecticut office. The toll free number has been listed in every communication made by the Applicant to landowners to facilitate their ability to obtain additional information in a timely manner. In addition, the Applicant designated a spokesperson and primary contact for fielding inquiries posed by the media and other interested stakeholders.

### **2. Systematic Stakeholder Outreach**

#### ***State, Local and Congressional Officials***

Prior to notifying affected landowners along the pipeline route, the government relations specialists on the Project team contacted state, county, municipal and other local officials, state legislators, and congressional delegation members and/or their staffs to apprise them of the Project. In conjunction with those contacts, the Applicant prepared preliminary maps and fact sheets outlining the purpose of the Project and the proposed facilities. The Applicant's representatives solicited input from interested stakeholders and will utilize that feedback as the design process evolves.

In order to enable local, state and federal government officials and elected representatives to be a touchstone for their constituents and serve as advocates for their concerns, the Applicant notified various officials prior to making written notification to affected landowners. The briefings of the aforementioned officials and staffs were well received and allowed them to be informed in anticipation of possible telephone calls or emails from constituents.

#### ***State and Federal Regulatory Agencies***

The Project team has endeavored to reach out to federal and state regulatory agencies from the outset of the Project's development. Contacts occurred as early as May 2013, and the Project environmental team will work with FERC staff to schedule federal and state interagency meetings. Just as input from landowners and public officials is important in our facility design, the feedback received from regulatory agencies also will be used in a similar fashion. As with other outreach activities, the Applicant's overarching goal is to submit a comprehensive certificate application that adequately supports the need for the Project, demonstrates mitigation of the Project's impacts and is responsive to the input received to date.

### **3. Impacted Landowner Outreach**

Shortly after the sessions with public officials, the Applicant mailed letters to affected landowners to describe the Project and to provide information about their rights as landowners consistent with FERC's landowner outreach process. Each letter contained a description of the Project and an indication that the recipient's property might be impacted by the Project. In addition, each letter contained the Project's toll-free telephone number and a general description of what landowners should expect from the Applicant, in terms of future survey requests and survey activities. Another letter was subsequently mailed to landowners formally requesting survey permission for the right-of-way for the proposed facilities. Most recently, landowners were sent personal invitations to attend landowner informational meetings in their area to discuss the proposed work, ask questions or voice concerns. The landowner informational meetings were held in April and May 2013, and additional landowner informational meetings will be held in the July-August 2013 timeframe.

#### **4. Stakeholder Communications: Newsletters, Mailings, and Website**

In order to provide current information on the Project and enable involvement by stakeholders, regular communications by mailings and/or newsletters will be provided to affected landowners as well as to public officials and other interested parties. A Project page on the Spectra Energy website was launched in September 2012. In addition to the toll-free telephone number, the website has been referenced and will continue to be referenced in communications related to the Project. Generally, the website will contain Project descriptions, information on FERC's processes, Project timetables, public meeting notices including locations, and answers to frequently asked questions. It also will contain hyperlinks to the Applicant's certificate application and to the PDF version of FERC's informational brochure entitled, *"An Interstate Natural Gas Facility on My Land? What Do I Need to Know?"* As the Project advances, notices of open houses and opportunities for public comment as well as news articles and other timely information resources will be posted on the Project's website.

#### **5. Landowner Informational Meetings and Informational Open Houses**

In an effort to provide timely Project information to landowners and public officials, the Project team conducted landowner informational meetings in April and May 2013, and will conduct additional landowner informational meetings in July-August 2013 timeframe. If deemed necessary, the Project team will conduct informational open houses during the third quarter of 2013.

Public officials who were briefed initially and affected landowners will be invited to attend the open houses. At each of the open houses, representatives from multiple disciplines within the Project team (e.g. right-of-way (ROW), environmental, engineering, construction, regulatory, stakeholder outreach, government relations, and

legal) will be on-hand to answer questions. The open houses are designed to be interactive in nature. These meetings are invaluable for Project team members because they will be able to hear first hand from interested stakeholders and respond to important questions about the ROW, easements, land records, pipeline safety, impacts of construction activities, and other aspects of the Project.

Within seven days of FERC issuing approval for the Applicant to enter into the Pre-Filing process, a proposed schedule of the open houses will be submitted to FERC. As the open house dates near, the dates and locations will be disseminated to landowners, public officials, and other stakeholders. Print advertisements will also be placed in local newspapers. The following is a description of the format and the types of information that will be provided at the open houses:

- a. Meetings generally will be conducted from 5:30–7:30 p.m.; team members from various disciplines will staff information stations;
- b. Displays will include a map providing an overview of the Project as well as mounted aerial and topographical maps; there will be sign-up sheets and follow-up sheets related to individual landowner inquiries;
- c. Handouts containing Project overviews and timelines, tables of required permits, Project-specific ‘Frequently Asked Questions’ and Project team contact information will be available; and
- d. Copies of *“An Interstate Natural Gas Facility on My Land? What Do I Need to Know?”* and information about pipeline safety, environmental mitigation measures, and smaller-scale Project corridor maps will be available.

## **6. FERC Site Visits and Scoping Meetings**

The Project team anticipates that FERC may conduct scoping meetings in local project areas in New York, Connecticut, Rhode Island and Massachusetts. As such, public officials and impacted landowners will be notified in writing by the Applicant in advance of FERC’s scoping meetings and in addition to FERC’s official notifications. Letters also will contain general descriptions of the purpose of the scoping meetings. Project team members will be at the scoping meetings to provide information.

## **7. Applicant's Stakeholder Outreach and Government Relations Team**

The Applicant will devote the necessary internal resources to ensure that stakeholder outreach and government relations activities are managed in a timely fashion. The Stakeholder Outreach and Government Relations teams recognize the importance of a comprehensive outreach program and will continue to implement it throughout the Project. A detailed Public and Agency Participation Plan has been developed and will be updated as needed. Updates will be included in the monthly reports to FERC staff.

FEDERAL ENERGY REGULATORY COMMISSION  
WASHINGTON, D.C. 20426

OFFICE OF ENERGY PROJECTS

In Reply Refer To:  
OEP/DG2E/Gas 2  
Algonquin Gas Transmission, LLC  
Docket No. PF13-16-000

June 28, 2013  
Berk Donaldson  
Regulatory Affairs  
Director, Rates and Certificates  
Algonquin Gas Transmission, LLC  
5400 Westheimer Court  
Houston, TX 77056-5310

**Re: Approval of Pre-Filing Request: Algonquin Incremental Market Project**

Dear Mr. Donaldson:

Thank you for your letter, filed June 18, 2013, requesting use of the Federal Energy Regulatory Commission's (FERC or Commission) pre-filing review process for Algonquin Gas Transmission, LLC's (Algonquin) planned Algonquin Incremental Market Project. We believe that beginning the Commission's review of these proposals prior to the receipt of your application will greatly improve our ability to identify issues early and address them in our environmental document.

As stated in your letter, Algonquin plans to construct and operate approximately 25.5 miles of 36 to 42-inch diameter mainline pipeline, 18 miles of 12 to 16-inch diameter lateral pipeline, construction at six existing compressor stations totaling 79,780 horsepower of additional compression, and appurtenant facilities in various counties of Connecticut, Massachusetts, Rhode Island, and New York. The additional firm pipeline capacity created by the project would allow Algonquin to deliver up to 433,000 dekatherms per day of natural gas.

Your letter also stated that Algonquin anticipates filing its application no later than February 2014. When Algonquin files its application with the Commission, we will evaluate the progress made during the pre-filing process, based in part on our success in resolving the issues raised during scoping. Once we determine that your application is ready for processing, we will establish a schedule for completion of the environmental document and for the issuance of all other federal authorizations.

- 2 -

My staff has reviewed the proposals submitted for the selection of a third-party contractor to assist us in preparing the National Environmental Policy Act documentation. We have selected Natural Resource Group, LLC (NRG) as the third-party contractor to work under the direct supervision and control of the Commission staff. I request that you proceed with executing a contract with NRG so work may begin as soon as possible.

If you have any questions, please contact the Office of Energy Projects' Environmental Project Manager for your project, Douglas A. Sipe at 202-502-8837, or Maggie Suter at 202-502-6463.

Sincerely,

Jeff C. Wright  
Director  
Office of Energy Projects

Re: *Algonquin Gas Transmission, LLC*, Docket No. CP14-\_\_\_\_-000  
Abbreviated Application for a Certificate of Public Convenience and Necessity and for  
Related Authorizations

Dear Ms. Bose:

Algonquin Gas Transmission, LLC (~~Algonquin~~) hereby submits for filing with the Federal Energy Regulatory Commission (~~Commission~~) an Abbreviated Application for a Certificate of Public Convenience and Necessity and for Related Authorizations (~~Application~~) regarding its proposed Algonquin Incremental Market Project (~~AIM Project~~). The AIM Project is designed to enable Algonquin to provide 342,000 dekatherms per day of firm transportation capacity to deliver natural gas to the AIM Project shippers.

Included herewith are four volumes. Volume I contains public information and is comprised of the Application and its public exhibits, except Exhibit F-I. Volume II contains the public version of Exhibit F-I, which is comprised of Volume II-A (resource reports) and Volume II-B (appendices to resource reports). Volume III contains privileged and confidential information and is comprised of Appendices 1D (landowner and stakeholder lists), 4B (archaeological field surveys) and 4C (cultural resources survey reports) of Exhibit F-1, Exhibit I (confidential market information), and proprietary hydraulic flow models. Volume IV contains Critical Energy Infrastructure Information (~~CEII~~) and is comprised of Exhibits G, G-I, and G-II.

Pursuant to the Commission's guidelines for eFiling,<sup>1</sup> Algonquin is hereby eFiling the Application and will provide two complete copies of the Application to OEP Room 62-46 and one complete copy to OGC-EP Room 101-66. Volume IV is marked ~~CONTAINS CRITICAL ENERGY INFRASTRUCTURE INFORMATION—DO NOT RELEASE~~<sup>2</sup> and should be treated as confidential pursuant to Order No. 630, et seq. and is for use by the Commission Staff only and not to be released to the public.<sup>3</sup> Volume III is marked ~~CONTAINS PRIVILEGED~~

AND FOR RELATED AUTHORIZATIONS**

UNITED STATES OF AMERICA  
BEFORE THE  
FEDERAL ENERGY REGULATORY COMMISSION

Algonquin Gas Transmission, LLC )

Docket No. CP14-\_\_\_\_-000

**ABBREVIATED APPLICATION OF  
ALGONQUIN GAS TRANSMISSION, LLC  
FOR A CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY  
AND FOR RELATED AUTHORIZATIONS**

Pursuant to Sections 7(b) and 7(c) of the Natural Gas Act (~~–NGA~~”), as amended,<sup>1</sup> and Part 157 of the regulations of the Federal Energy Regulatory Commission (~~–Commission~~”),<sup>2</sup> Algonquin Gas Transmission, LLC (~~–Algonquin~~”) hereby files this abbreviated application for a certificate of public convenience and necessity and for related authorizations (~~–Application~~”) for the Algonquin Incremental Market Project (~~–AIM Project~~” or ~~–Project~~”), including Commission authorizations to (i) construct, install, own, operate and maintain approximately 37.6 miles of take-up and relay, loop and lateral pipeline facilities and related facilities in New York, Connecticut, and Massachusetts; (ii) modify six existing compressor stations in New York, Connecticut and Rhode Island resulting in the addition of 81,620 horsepower (~~–hp~~”) of compression; (iii) modify 24 existing metering and regulating (~~–M&R~~”) stations and construct three new M&R stations; and (iv) abandon certain existing facilities, as more fully described herein. Algonquin also seeks Commission authorization as part of this Application for approval of the *pro forma* tariff records included herewith as part of Exhibit P to establish the initial incremental AIM Project firm transportation rate under Rate Schedule AFT-1,

---

<sup>1</sup> 15 U.S.C. §§ 717f(b) and (c) (2013).

<sup>2</sup> 18 C.F.R. § 157.7 (2013).

an incremental fuel percentage applicable to service on the AIM Project, and the initial recourse rates under Rate Schedules AFT-CL and AIT-2 for service on the West Roxbury Lateral (defined below).<sup>3</sup>

The AIM Project is designed to enable Algonquin to provide 342,000 dekatherms per day (–Dth/d”) of firm transportation service from Algonquin’s existing receipt point in Ramapo, New York, to various Algonquin city gate delivery points in Connecticut, Rhode Island and Massachusetts. Algonquin has executed precedent agreements (–Precedent Agreements”) for all of the Project capacity with ten shippers, including eight New England local distribution companies (–LDCs”) and two municipal utilities (collectively, –Project Shippers”).<sup>4</sup> In addition, the AIM Project is expected to alleviate, in part, existing constraints, resulting in increased commodity price competition and reduced gas price volatility in the Northeast markets. Algonquin initiated the Pre-filing review process for the AIM Project in Docket No. PF13-16-000 and received approval from the Commission to use the Pre-filing process on June 28, 2013.<sup>5</sup> The instant Application incorporates the comments and information received during the Pre-filing process from Commission Staff and interested stakeholders.

---

<sup>3</sup> The terms –AIM Project” and –AIM Project facilities” in the context of the project facilities refers to all of the facilities to be constructed under the certificate authority requested herein, including the West Roxbury Lateral. In accordance with Algonquin’s tariff, however, the incremental AIM Project rate under Rate Schedule AFT-1 and related AIM Project incremental fuel will be assessed for transportation on the AIM Project facilities excluding the West Roxbury Lateral. Separate recourse rates under Rate Schedules AFT-CL and AIT-2 are applicable to firm or interruptible transportation on the AIM Project’s West Roxbury Lateral facilities.

<sup>4</sup> The Project Shippers are Bay State Gas Company d/b/a Columbia Gas of Massachusetts, Inc., Boston Gas Company d/b/a National Grid, Colonial Gas Company d/b/a National Grid, Connecticut Natural Gas Corporation, Middleborough Gas and Electric, The Narragansett Electric Company d/b/a National Grid, Norwich Public Utilities, NSTAR Gas Company, The Southern Connecticut Gas Company, and Yankee Gas Services Company.

<sup>5</sup> *Algonquin Gas Transmission, LLC*, Approval of Pre-Filing Request, Docket No. PF13-16 (June 28, 2013).

Algonquin requests that the Commission grant the authorizations requested herein on or before January 31, 2015, in order for Algonquin to have the time necessary to complete and place into service the facilities proposed herein by November 1, 2016.<sup>6</sup> The AIM Project requires a two-year construction plan designed to minimize any disruptions to existing shippers and to reduce the potential for supply disruptions to the Northeast gas and electric markets, which are already constrained due to lack of pipeline infrastructure. As such, Algonquin is requesting authorization from the Commission by January 31, 2015, which will allow Algonquin to begin construction in March 2015 in order to complete a portion of the work in 2015 and mitigate construction related outages to existing shippers. A November 1, 2016, in-service date will ensure that the firm transportation service contemplated by this Application is available for the 2016-17 winter heating season which is consistent with the timing contemplated under the Precedent Agreements with the Project Shippers, included herein as Exhibit I, with the extensive work done during the Pre-filing process, and with the timing contemplated in the Project-related approvals obtained by the Project Shippers in their respective state commission and municipal authority processes. Moreover, the timely issuance of the certificate order, enabling a November 1, 2016, in-service date, is essential to meeting the obligations of the Project Shippers to serve the expanding loads within their respective service territories, addressing pipeline infrastructure needs as detailed in state energy plans, and providing reasonably-priced, natural gas supplies to customers in the Northeast.

---

<sup>6</sup> In order to construct the AIM Project and meet the agreed-upon in-service date of November 1, 2016, while ensuring adequate capacity is available to meet the contractual commitments with existing firm customers during the lift and relay segments of construction, Algonquin will need to place certain Project facilities in-service as they are completed in late-2015 and early-2016. Algonquin will address the in-service schedule for the Project facilities in the implementation plan that will be filed prior to the commencement of construction.

In support hereof, Algonquin shows as follows:

**I.  
Identity of Applicant**

Algonquin is a limited liability company organized and existing under the laws of the State of Delaware and has its principal place of business at 5400 Westheimer Court, Houston, Texas 77056-5310. Algonquin also has permanent offices in Massachusetts, at 890 Winter Street, Suite 300, Waltham, Massachusetts 02451. Algonquin is an indirect, wholly-owned subsidiary of Spectra Energy Partners, LP.

Algonquin is a ~~“natural gas company”~~ as defined in the NGA, engaged in the transportation of natural gas in interstate commerce subject to the jurisdiction of the Commission. Algonquin owns and operates a natural gas pipeline system extending from points near Lambertville and Hanover, New Jersey, through the states of New Jersey, New York, Connecticut, Rhode Island, and Massachusetts, to points near the Boston area.

## **II. Description of Project**

### **A. Overview of Project**

Demand is growing in the Northeast for the increased utilization of natural gas as a source of fuel that is economical, domestically produced, clean-burning and efficient. Certain of the Northeast states, such as Connecticut, have issued comprehensive energy strategies that include specific recommendations for increasing the use of natural gas in their respective states.<sup>7</sup> With more homes and commercial buildings in this region now converting heating units and appliances to natural gas, and the utilization of natural gas for industrial purposes also increasing, demand for natural gas in the region is expected to increase.<sup>8</sup> Additionally, expanding access to the Northeast natural gas markets is critical to eliminate capacity constraints that have contributed to price volatility resulting in natural gas prices in New England that are historically higher than markets elsewhere in North America.

---

<sup>7</sup> *2013 Comprehensive Energy Strategy for Connecticut*. ("CES")  
Online: [http://www.ct.gov/deep/lib/deep/energy/cep/2013\\_ces\\_final.pdf](http://www.ct.gov/deep/lib/deep/energy/cep/2013_ces_final.pdf)

<sup>8</sup> As reflected in Resource Report 1 included in Exhibit F-1 hereto, demand for natural gas in New England is projected to increase by 13.5 percent by 2020 (ICF Natural Gas Market Compass, July 2013).

The AIM Project will provide much needed pipeline capacity to meet the Project Shippers' immediate and future needs for natural gas. Specifically, the AIM Project enables Algonquin to provide 342,000 Dth/d of firm transportation capacity to the ten Project Shippers. The AIM Project will utilize a strategic receipt point located at Ramapo, New York, to obtain additional access to growing supply areas, thereby providing the Project Shippers with additional economical supplies of natural gas. Furthermore, adding pipeline capacity along a significant portion of Algonquin's mainline is expected to provide secondary benefits, such as alleviating constraints, resulting in increased commodity price competition and reduced gas price volatility in the region.

Algonquin held open seasons for the AIM Project from December 13, 2010, through February 11, 2011, and from September 20, 2012, through November 2, 2012, and held a supplemental open season and reverse open season from June 11, 2013, through June 25, 2013, as described in Section IV below. Copies of the open season and supplemental open season and reverse open season notices are included in Exhibit Z-1 to this Application.

As a result of the open seasons, Algonquin has executed precedent agreements with the Project Shippers for firm transportation service to deliver new, critically needed natural gas supplies to the Northeast.<sup>9</sup> Each of the Precedent Agreements has been approved by the relevant shipper's state regulatory commissions or has been considered

---

<sup>9</sup> The Precedent Agreements are included herewith as Exhibit I and have been submitted as privileged pursuant to Section 388.112 of the Commission's regulations.

in a state regulatory commission hearing or municipal authority process.<sup>10</sup> These proceedings addressed the benefits that the Project will provide as of November 1, 2016, including (i) access to, and reliability of, supply to meet market demand and replace declining supplies from other regions, (ii) eliminating the need for the Project Shippers to rely on higher-cost, spot market purchases, if available,<sup>11</sup> and (iii) enabling the Connecticut Project Shippers to meet the reliability standards in the CES.<sup>12</sup> These Project Shippers' commitments provide the economic underpinning for Algonquin to proceed with the Project.<sup>13</sup> Placing the Project facilities in service by November 1, 2016, will allow the Project Shippers to receive service, as contemplated in the Precedent Agreements for the Project and considered in the state commission proceedings and municipal authority processes, and to meet increased peak demand at the beginning of the 2016-17 winter heating season.

## **B. Description of Facilities**

Algonquin proposes the following activities as part of the AIM Project:

---

<sup>10</sup> Boston Gas Co. and Colonial Gas Co. each d/b/a National Grid, MA D.P.U. 13-157 (2014) (~~–National Grid~~); Bay State Gas Co. d/b/a Columbia Gas of Massachusetts, MA D.P.U. 13-158 (2014); NSTAR Gas Co., MA D.P.U. 13-159 (2014); In re: PURA Investigation of Connecticut's Local Distribution Companies' Proposed Expansion Plans to Comply with Connecticut's Comprehensive Energy Strategy, CT PURA 13-06-02 (Nov. 22, 2013) (approving precedent agreements with Connecticut Natural Gas, Southern Connecticut Gas, and Yankee Gas) (~~–PURA Order~~); In re: PURA Investigation of Connecticut's Local Distribution Companies' Proposed Expansion Plans to Comply with Connecticut's Comprehensive Energy Strategy, CT PURA 13-06-02 (Dec. 26, 2013) (approving Yankee Gas's revised capacity plan as complying with the PURA Order); *see also* 2013 Gas Cost Recovery Filing of The Narragansett Electric Company d/b/a National Grid, R.I. Pub. Util. Comm'n, Docket 4436 (Sep. 3, 2013).

<sup>11</sup> *See e.g.*, National Grid at 21-22.

<sup>12</sup> PURA Order at 21.

<sup>13</sup> Agreements for long-term firm capacity are important evidence of market demand for a new project. *Certification of New Interstate Natural Gas Pipeline Facilities*, 88 FERC ¶ 61,227, at p. 61,744 (1999) (~~–Certificate Policy Statement~~), *order clarifying Statement of Policy*, 90 FERC ¶ 61,128 (2000), *order further clarifying Statement of Policy*, 92 FERC ¶ 61,094 (2000).

### *Pipeline Facilities*

- (i) install approximately 20.1 miles of 42-inch diameter pipeline that will replace certain segments of 26-inch diameter pipeline, including approximately 6.8 miles in Rockland County, New York, approximately 8.8 miles in Westchester County, New York, approximately 0.1 miles in Putnam County, New York and approximately 4.4 miles in Fairfield County, Connecticut (including horizontal directional drills of 0.7 miles crossing the Hudson River and 0.7 miles crossing I-84/Still River);
- (ii) install approximately 2.0 miles of 36-inch diameter pipeline looping in Middlesex and Hartford Counties, Connecticut (Line 36A Loop);
- (iii) install approximately 9.1 miles of 16-inch diameter pipeline that will replace a corresponding segment of 6-inch diameter pipeline on the E-1 System Lateral in New London County, Connecticut (E-1 System Lateral Take-up and Relay);
- (iv) install approximately 1.3 miles of 12-inch diameter pipeline looping in New London County, Connecticut (E-1 System Lateral Loop); and
- (v) construct approximately 4.2 miles of 16-inch diameter pipeline and approximately 0.9 miles of 24-inch diameter pipeline off its existing I-4 System Lateral in Norfolk and Suffolk Counties, Massachusetts (—West Roxbury Lateral”).

### *Modifications to Existing Compressor Stations*

- (i) Stony Point Compressor Station – install two new Solar Mars 100, 15,900 hp natural gas-fired compressor units, restage one existing compressor unit, install gas cooling for the new compressor units and modify station piping at Algonquin’s existing compressor station in the Town of Stony Point, Rockland County, New York;
- (ii) Southeast Compressor Station - install one new Solar Taurus 70, 10,320 hp natural gas-fired compressor unit, restage one existing compressor unit, replace the compressor body of one existing compressor unit, install gas cooling for the new compressor unit and modify station piping at Algonquin’s existing compressor station in the Town of Southeast, Putnam County, New York;
- (iii) Oxford Compressor Station – restage one existing compressor unit at Algonquin’s existing compressor station in the Town of Oxford, New Haven County, Connecticut;
- (iv) Cromwell Compressor Station - install one new Solar Mars 100, 15,900 hp natural gas-fired compressor unit, install gas cooling for the new compressor unit and two existing turbine-driven compressor units, and

modify station piping at Algonquin's existing compressor station in the Town of Cromwell, Middlesex County, Connecticut;

- (v) Chaplin Compressor Station - install one new Solar Taurus 60, 7,700 hp natural gas-fired compressor unit, restage two existing compressor units, install gas cooling for the new compressor unit and two existing compressor units, and modify station piping at Algonquin's existing compressor station in the Town of Chaplin, Windham County, Connecticut; and
- (vi) Burrillville Compressor Station - install one new Solar Mars 100, 15,900 hp natural gas-fired compressor unit, restage two existing compressor units, install gas cooling for the new compressor unit and modify station piping at Algonquin's existing compressor station in the Town of Burrillville, Providence, Rhode Island.

*New Metering and Regulating ("M&R") Stations*

- (i) Oakland Heights M&R Station – construct a new M&R station allowing an interconnection with Norwich Public Utilities in the City of Norwich, New London County, Connecticut;
- (ii) Assonet M&R Station – construct a new M&R station allowing an interconnection with NSTAR Gas Company in the Town of Freetown, Bristol County, Massachusetts; and
- (iii) West Roxbury M&R Station – construct a new M&R station at MP 4.2 of the proposed West Roxbury Lateral pipeline to deliver natural gas to Boston Gas Company in the City of Boston (West Roxbury), Suffolk County, Massachusetts.

*Existing M&R Station Modifications*

The AIM Project will include modifications to 24 existing Algonquin M&R stations in New York, Connecticut and Massachusetts, to accept the new gas flows associated with the AIM Project. Three M&R stations are located in New York, 14 are located in Connecticut and eight are located in Massachusetts. The types of modifications will include the replacement of existing heaters and metering facilities, piping modifications, and facility uprates. One existing M&R station will be removed in the City of Norwich, New London County, Connecticut (Greenville).

*Other New Aboveground Facilities*

- (i) Removal of launcher/receiver facilities and installation of new piping at existing Main Line Valve (–MLV”) 13B at MP 0.0 (Haverstraw to Stony Point Take-up and Relay) in Rockland County, New York;
- (ii) Installation of a new 42-inch MLV cross over piping and a 26-inch launcher facility at MP 2.60 (Stony Point to Yorktown Take-up and Relay) in Rockland County, New York;
- (iii) Installation of a new 42-inch MLV, cross over piping and a 26-inch receiver facility at MP 5.48 (Stony Point to Yorktown Take-up and Relay) in Westchester County, New York;
- (iv) Replace the existing 26-inch valve with a 42-inch valve equipped with Remote Control Valve (RCV) capability and install cross over piping at existing MLV 15 at MP 11.0 (Stony Point to Yorktown Take-up and Relay) in Westchester County, New York;
- (v) Install a 42-inch receiver barrel and a 26-inch launcher barrel, pressure regulating facilities and associated cross-over piping at MP 12.3 (Stony Point to Yorktown Take-up and Relay) in Westchester County, New York;
- (vi) Install a new 42-inch mainline valve with suction and discharge valves at the Southeast Compressor Station MP 0.0 (Southeast to MLV 19 Take-up and Relay) along with a new 42-inch launcher barrel assembly, Putnam County, New York;
- (vii) Replace the existing 26-inch valve with a 42-inch valve equipped with Remote Control Valve (RCV) capability, install a 26-inch launcher barrel and install a 42-inch receiver barrel. Also, install pressure regulating facilities and associated cross-over piping at existing MLV 19 at MP 4.4 (Southeast to MLV 19 Take-up and Relay) in Fairfield County, Connecticut;
- (viii) Install a receiver facility, cross over piping at MP 2.0 (Cromwell Line-36A Loop Extension) in Hartford County, Connecticut;
- (ix) Removal of the existing 6-inch launcher assembly and install new piping at the existing facility on the 16-inch E-1 Lateral at MP 0.0 (E-1 System Lateral Take-up and Relay) in the Town of Lebanon, New London County, Connecticut;
- (x) Install a 16-inch receiver facility and 6-inch launcher facility and valve assembly at a new launcher/receiver facility at the end of 16-inch E-1 Lateral at MP 9.1 in the Town of Franklin, New London County, Connecticut;

- (xi) Removal of the 12-inch receiver facility and interconnect with E-1 Lateral at MP 0.0 (E-1 System Lateral Loop) in the Town of Montville, New London County, Connecticut;
- (xii) Install a 12-inch receiver facility and interconnect with E-1 Lateral at MP 1.3 (E-1 System Lateral Loop) in the Town of Montville, New London County, Connecticut;
- (xiii) Install 16-inch launcher barrel and associated lateral valves at the new West Roxbury Lateral Launcher Facility at MP 0.0 (West Roxbury Lateral) in the Town of Westwood, Norfolk County, Massachusetts; and
- (xiv) Install 16-inch receiver, 24-inch launcher and associated lateral valves at the new West Roxbury Meter Station Facility at MP 4.2 (West Roxbury Lateral) in the City of Boston, Suffolk County, Massachusetts.

The AIM Project utilizes, to the maximum extent possible, existing facility locations and existing right-of-way (“ROW”) along the Algonquin system. The location and design of the facilities proposed in this Application are more fully described in Exhibits F, F-1, and G through G-II of this Application.

Algonquin requests that the Commission grant the authorizations requested herein on or before January 31, 2015, in order for Algonquin to have the time required, consistent with a two-year construction plan designed to minimize any disruptions to existing shippers, to complete and place into service the facilities proposed herein by November 1, 2016. A November 1, 2016, in-service date will ensure that the firm transportation service contemplated by this Application is available for the 2016-17 winter heating season and is consistent with the timing contemplated under the Precedent Agreements. Algonquin requests that the Commission grant any other authorizations and waivers necessary to implement the proposal contained herein.

### **III.**

#### **Evaluation of Application Pursuant to Certificate Policy Statement**

The Commission established criteria in the Certificate Policy Statement for determining whether there is a need for a proposed project and whether the proposed

project will serve the public interest.<sup>14</sup> The Certificate Policy Statement explains that, in deciding whether to authorize the construction of major new pipeline facilities, the Commission balances the public benefits of the project against the project's potential adverse consequences.<sup>15</sup> The Commission's stated goal in evaluating new pipeline construction is to give appropriate consideration to the enhancement of the competitive transportation alternatives, the possibility of over-building, subsidization by existing customers, the applicant's responsibility for unsubscribed capacity, the avoidance of unnecessary disruptions of the environment, and the unneeded exercise of eminent domain.<sup>16</sup> Once the applicant demonstrates that the benefits to be achieved by the project will outweigh the potential adverse effects, the Commission will find that the project is required by the public convenience and necessity.<sup>17</sup> As demonstrated herein, the proposed facilities meet the criteria of the Certificate Policy Statement, and approval of the Project will serve the public interest and is required by the public convenience and necessity.

**A. The AIM Project Meets the Threshold No-Subsidy Test.**

The AIM Project satisfies the economic threshold requirement for existing pipelines because it avoids subsidization by Algonquin's existing customers and does not adversely impact their rates. Specifically, Algonquin is proposing herein an initial incremental recourse rate and an incremental fuel percentage for firm transportation service on the AIM Project, as well as recourse rates for firm and interruptible transportation on the West Roxbury Lateral. Because Algonquin is proposing to recover

---

<sup>14</sup> *Id.* at p. 61,745-46.

<sup>15</sup> *Tennessee Gas Pipeline Co.*, 92 FERC ¶ 61,142, pp. 61,519-20 (2000).

<sup>16</sup> *Id.*

<sup>17</sup> Certificate Policy Statement at p. 61,746.

the costs associated with the AIM Project facilities through the incremental recourse rate for service on the mainline facilities and through the recourse rates for service on the new lateral, the AIM Project is financially viable without adverse rate effects on, or subsidies from, Algonquin's existing customers. Accordingly, the AIM Project meets the threshold requirement established by the Commission's Certificate Policy Statement.<sup>18</sup> While Algonquin is not seeking approval at this time to roll-in the costs of the Project, Algonquin reserves its right to do so in the future as part of a general rate case proceeding.

**B. The AIM Project Will Not Have Adverse Effects on Existing Customers or on Existing Pipelines and Their Captive Customers.**

The next step in the Certificate Policy Statement analysis is to identify potentially adverse effects of the project on the existing customers of the pipeline proposing the project, existing pipelines in the market and their captive customers, or landowners and communities affected by the new construction and to determine whether the applicant has made efforts to eliminate or minimize those adverse effects.<sup>19</sup> If residual adverse effects on these groups are identified after efforts have been made to minimize them, the Commission will evaluate the project by balancing the evidence of public benefits to be achieved against the residual adverse effects.”<sup>20</sup>

Since Algonquin is proposing an incremental recourse rate, incremental fuel for the Project and initial recourse rates for the West Roxbury Lateral, the AIM Project will not cause or result in a degradation of service to existing customers, nor, as explained above, adversely impact rates of existing customers. The Project is designed to provide

---

<sup>18</sup> *Id.* at p. 61,745.

<sup>19</sup> *Id.*

<sup>20</sup> *Id.*

additional firm pipeline capacity to deliver natural gas to New England to meet immediate and future supply and load growth requirements of the Project Shippers, all of which are existing customers of Algonquin. In addition, the increased access to supply, even on a secondary basis, is expected to benefit existing customers and Northeast markets by alleviating constraints, resulting in increased commodity price competition and reduced gas price volatility in the region. Also, the incremental facilities and upgrades that are proposed under the Project will increase overall Algonquin system flexibility and reliability. Accordingly, the AIM Project will not have an adverse effect on existing customers.

Moreover, the AIM Project will increase firm capacity to the Project Shippers' city gate delivery points to accommodate increasing demand. The Project is not designed to bypass an existing pipeline nor to provide service that is already provided by another pipeline. Instead, the Project offers new transportation capacity for incremental demand and will not adversely affect existing pipelines or their customers. For the foregoing reasons, the AIM Project will not have adverse effects on existing customers or existing pipelines and their customers.

**C. Algonquin Has and Continues to Minimize the Potential for Adverse Impacts on Landowners and Communities Affected by the AIM Project.**

As demonstrated in the accompanying Resource Reports, Algonquin has made substantial efforts to ensure that the construction of the AIM Project will have limited residual adverse impacts to landowners and the environment. To the extent practicable, Algonquin will construct the facilities utilizing existing ROW and previously disturbed property, thereby limiting any new disturbances to the environment during construction. Approximately 92 percent of the proposed pipeline facilities involve take-up and relay

and looping that occur within or adjacent to existing ROW, including Algonquin pipeline ROW, public roadways, railways and/or other utility ROW. Similarly, modifications at 21 of the 24 existing M&R stations are minor in nature and will take place within the existing fenced facilities.

Consistent with the Commission's desire for early input by potential stakeholders and with the Commission's endorsement of the use of collaborative procedures in developing new pipeline projects, Algonquin has made significant efforts prior to and throughout the pre-filing process initiated in June 2013 in Docket No. PF13-16-000, to inform the public, particularly affected landowners, relevant resource agencies, and other interested stakeholders about the AIM Project. A list of the federal, state and local agencies and environmental groups that Algonquin has consulted in developing the AIM Project is contained in Exhibit J and Resource Report No. 1 of Exhibit F-1 to this Application.

Algonquin will provide timely written notice of this Application and other required information to landowners that are directly affected by the Application, as well as to local communities and local, state, and federal governments and agencies involved in the AIM Project in accordance with the Commission's landowner notification requirements.<sup>21</sup>

The AIM Project will have limited residual impacts on landowners and communities affected by the Project. Algonquin will construct the AIM Project utilizing proven construction techniques and mitigation procedures, and the Project will not result

---

<sup>21</sup> See 18 C.F.R. § 157.6(d)(2)(iii) (2013). In accordance with the Commission's regulations, Algonquin will also publish notice of the Application in relevant daily and/or weekly newspapers of general circulation. In addition, Algonquin will place a copy of the Application in the town or city hall and library of each municipality along the proposed route, thereby exceeding the Commission's requirements. 18 C.F.R. § 157.10.

in significant impacts to the environment. The Resource Reports included in Exhibit F-1 provide a detailed explanation of the limited environmental impacts associated with the AIM Project and the measures that Algonquin intends to take to mitigate such impacts.

**D. The Benefits of the AIM Project Outweigh Potential Residual Adverse Effects.**

When determining whether a proposed project is needed and will serve the public interest, the Commission balances the public benefits to be achieved by the project against the residual impacts of the proposed project on the relevant interests listed above. Given Algonquin's mitigation efforts, and the limited residual impacts on the relevant interests listed above, the benefits of the AIM Project far outweigh any potential adverse effects.

Algonquin designed the AIM Project to provide incremental firm natural gas transportation capacity to meet the load growth demands of the Project Shippers. The Project offers cost-effective and reliable transportation service to meet this demand. In addition, the AIM Project is expected to alleviate in part existing constraints, resulting in increased commodity price competition and reduced gas price volatility in the Northeast markets.

**E. The AIM Project Is Required by the Public Convenience and Necessity.**

The AIM Project is consistent with the criteria of the Certificate Policy Statement, and the construction and operation of the facilities proposed herein are in the public interest and required by the public convenience and necessity. The AIM Project will provide numerous benefits to the Project Shippers, existing shippers, markets along the system and natural gas consumers, including:

- (i) providing long-term, secure firm transportation service to the Project Shippers;

- (ii) providing Project Shippers with access to diverse supply in order to promote stability, reliability and the better management of price volatility;
- (iii) providing new capacity that can be utilized by other Algonquin shippers on a secondary and interruptible basis and through capacity release to meet the increasing natural gas demand in the Northeast markets;
- (iv) reducing existing constraints, resulting in increased commodity price competition and reduced price volatility; and
- (v) providing improved operational reliability.

For the foregoing reasons, Algonquin respectfully submits that granting the authorizations requested herein is required by the public convenience and necessity. Commission approval of the AIM Project in the timeframe requested herein will benefit the Northeast markets by providing Project Shippers enhanced access to diverse supplies of natural gas in a timely manner.

In summary, the AIM Project satisfies the Commission's Certificate Policy Statement and is consistent with the Commission's economic and environmental goals. Algonquin will construct the Project with minimal landowner and environmental impacts. As described in detail in this Application and the accompanying exhibits, the AIM Project significantly and substantially expands the natural gas transmission grid in the Northeast and will provide the pipeline capacity necessary to transport the natural gas supplies necessary to meet the Project Shippers' demand. The benefits of this Project far outweigh the potential residual impacts of the Project, which have been or will be mitigated through Algonquin's efforts as described in this Application. Accordingly, the AIM Project meets the standards of the Certificate Policy Statement, is in the public interest, and is required by the public convenience and necessity.

#### **IV. Open Seasons**

In compliance with the Commission's policy and precedent, Algonquin conducted open seasons to solicit interest for incremental service as part of the AIM Project, and a reverse open season to determine the appropriate design and size of the Project.

To determine whether demand existed for firm service as part of the AIM Project, Algonquin held open seasons for the Project from December 13, 2010, through February 11, 2011, and from September 20, 2012, through November 2, 2012. Based on the bids received in these open seasons, Algonquin determined to move forward with the AIM Project and executed precedent agreements for service on the Project.

Algonquin held a supplemental open season and reverse open season from June 11, 2013, through June 25, 2013, to solicit bids for additional capacity and for the release of existing firm transportation entitlements to reduce the scope of the Project facilities. Based on the additional commitments received, Algonquin revised the scope of the Project to the current design capacity of 342,000 Dth/day and executed additional precedent agreements. In response to the reverse open season, Algonquin executed agreements with two existing customers to turnback 12,000 Dth/d of existing capacity on the Algonquin system.

#### **V. Environmental Impact**

The Resource Reports included herewith more fully describe the potential environmental impacts of the AIM Project. The information provided in the Resource Reports has been prepared in accordance with Part 380 of the Commission's regulations

for the Commission Staff to conduct its environmental analysis of the Project in this proceeding.

As the Resource Reports show, the environmental impact associated with the construction of the AIM Project can be adequately mitigated. Algonquin has incorporated the Commission's *Upland Erosion Control, Revegetation and Maintenance Plan* and the Commission's *Wetland and Waterbody Construction and Mitigation Procedures* (January 17, 2003 versions of both) into the Erosion and Sediment Control Plan to be used in this proposal. In addition, Algonquin will incorporate standard environmental mitigation measures into its construction specifications.

The Resource Reports demonstrate that (i) any adverse impacts associated with the AIM Project can be adequately mitigated or avoided, (ii) the proposed action is the best alternative, (iii) the short-term use of the environment will not conflict with the long-term productivity, and (iv) significant resources will not be irreversibly or irretrievably lost due to the construction activities. Under these circumstances, approval of the proposed facilities described herein will not be a major federal action significantly affecting the quality of the human environment.

The AIM Project will be constructed in accordance with applicable environmental permits, approvals and regulations. Algonquin is committed to minimizing the environmental impact of the Project and to reclaiming all disturbed areas to a consistently high standard, regardless of land ownership. Algonquin will work diligently to ensure that any questions related to the environmental aspects of the AIM Project are resolved promptly and completely and that the facilities are constructed in an efficient and appropriate manner. In addition, and consistent with the Commission's desire for early input by potential stakeholders, Algonquin has made significant efforts throughout the

Pre-filing process in Docket No. PF13-16-000 to inform the public, particularly landowners, relevant resource agencies, and other interested stakeholders, about the AIM Project.

The construction activities are not anticipated to have adverse effects on residences or industrial areas. The construction activities will not have a negative impact on public, recreational, or scenic areas, and the impact on vegetation, wildlife, and cultural resources will be limited. As described in the Resource Reports, Algonquin will, to the extent practicable, utilize existing right-of-way to install new pipeline and for the above-ground facility modifications.

## **VI. Supply**

Algonquin's shippers are responsible for obtaining the gas supplies to be transported on Algonquin's pipeline system. Algonquin proposes to provide only open-access transportation service for the facilities proposed herein.

## **VII. Rates and Tariff**

Algonquin is proposing to charge an initial incremental recourse rate under Rate Schedule AFT-1 for firm service on the AIM Project commencing on the in-service date of the Project. In addition, Algonquin is proposing to charge recourse rates under Rate Schedules AFT-CL and AIT-2 for service on the West Roxbury Lateral. The Commission has previously approved initial rates for service on new discrete lateral facilities under Rate Schedule AFT-CL under similar circumstances.<sup>22</sup> These rates and the support for the derivation of these rates are set forth in Exhibit P to this Application.

---

<sup>22</sup> See, e.g., *Algonquin Gas Transmission Co.*, 88 FERC ¶ 62,140 (1999) (Lake Road Lateral); 83 FERC ¶ 61,200 (1998) (ANP Lateral); 81 FERC ¶ 61,220 (1997) (Middletown Lateral); 81 FERC ¶ 61,019 (1997) (Taunton Lateral); 71 FERC ¶ 61,069 (1995), *as amended*, 75 FERC ¶ 61,284 (1996) (Canal Lateral).

As reflected on the *pro forma* tariff records attached hereto as part of Exhibit P, the incremental recourse reservation rate is \$42.575 per month per Dth of capacity subscribed, with respect to firm service on the AIM Project.<sup>23</sup> Algonquin proposes to charge its system interruptible transportation rate for interruptible service on the AIM Project.<sup>24</sup> Algonquin proposes to implement an initial West Roxbury Lateral firm reservation rate of \$18.198 per month per Dth, as well as an initial interruptible rate of \$0.598 per Dth, based on a 100% load factor of the firm rate on the West Roxbury Lateral.

As shown in Exhibit P, Algonquin has utilized its system depreciation rate of 1.81 percent in deriving the AIM Project incremental recourse rate. In addition, Algonquin has utilized a depreciation rate of 6.67 percent in deriving the initial recourse rates for the West Roxbury Lateral. The proposed initial recourse rates for the service on the West Roxbury Lateral are based on an estimated total facility cost of approximately \$95 million, and rate determinants of 100,000 Dth.

Algonquin proposes to recover incremental fuel use and lost and unaccounted for fuel (“LAUF”) on the AIM Project through its fuel retention percentages. The incremental fuel derivation is shown on Exhibit Z-2. Consistent with the Commission’s

---

<sup>23</sup> Algonquin requests that the Commission not pre-judge the merits, nor foreclose the possibility, of a future request by Algonquin for rolled-in treatment. *See Texas Eastern Transmission, LP*, 129 FERC ¶ 61,151 (2009) (acknowledging that Texas Eastern had “not sought to roll in the project costs” and holding that “if in the future Texas Eastern seeks to roll in the costs associated with the project, it must demonstrate that such roll-in will not result in any subsidization by existing customers”); *Maritimes & Northeast Pipeline, L.L.C.*, 95 FERC ¶ 61,077 at p. 61,227 (2001) (noting that Maritimes would have the burden of proof to establish rolled-in rates during its next rate case).

<sup>24</sup> *See Texas Eastern Transmission, LP, et al.*, 139 FERC ¶ 61,138 at P 31 (2012) (stating that “Commission policy is to require a pipeline to charge its current system IT rate for any interruptible service rendered on additional capacity made available as a result of an incremental expansion that is integrated with existing pipeline facilities.”).

policy and precedent,<sup>25</sup> Algonquin proposes to track changes in fuel for this incremental service through its FRQ mechanism set forth in Section 32 of the General Terms and Conditions in Algonquin's FERC Gas Tariff (~~GT&C~~). Algonquin will adjust its periodic tracker mechanisms to ensure that existing customers do not subsidize the costs resulting from these new incremental services.

Algonquin will provide services to the Project Shippers at negotiated rates in accordance with the negotiated rate authority set forth in GT&C Section 46 and pursuant to the terms of the negotiated rate agreements. The agreements include a provision to adjust the negotiated rates to reflect the final capital cost of the Project facilities, a most favored nations provision and a contractual right of first refusal. Algonquin will file tariff records reflecting its negotiated rate agreements with the Project Shippers within 30 to 60 days prior to when the underlying negotiated rates are proposed to become effective.

#### **Service Agreement Extension**

In addition to the proposed negotiated rates described above, Algonquin agreed to extension rights with certain Project Shippers. The Commission has accepted such extension rights in previous proceedings.<sup>26</sup>

#### **AFUDC Representation**

Algonquin hereby provides its statement representing that the Allowance for Funds Used During Construction (~~AFUDC~~) accruals included in the cost of the AIM Project, reflected in Exhibit K hereto, are in compliance with the Commission's policy on

---

<sup>25</sup> See *Algonquin Gas Transmission, LLC*, 117 FERC ¶ 61,319, P 91 (2006).

<sup>26</sup> See *Ruby Pipeline, LLC*, 128 FERC ¶ 61,224 at P 78 (2009) (approving renewal rights negotiated with shippers); *Rockies Express Pipeline LLC*, 116 FERC ¶ 61,272 at PP 23, 72 (2006) (approving ~~rate~~ and contractual offerings that are based on a shipper's status" as an anchor shipper, including rollover rights).

AFUDC accruals as set forth in the AD10-3-000 proceeding.<sup>27</sup> Algonquin began accruing AFUDC for the AIM Project on May 17, 2013, and in accordance with the Commission's AFUDC policy, Algonquin hereby affirms that it had begun to incur capital expenditures for the Project on that date and those activities necessary to prepare the Project for its intended use were in progress at that time.

### **VIII. Other Applications**

With the exception of the instant Application, Algonquin knows of no other applications pending or required before the Commission under the NGA for the proposed AIM Project. Algonquin will require other federal, state, and local authorizations for the facilities proposed herein, in addition to the authorizations requested in this Application. Algonquin is working with a number of federal, state, and local agencies to obtain permits, as necessary, to complete the construction of the Project. Algonquin has included, in Exhibit J and as part of Resource Report No. 1, a list of all required permits and certificates to construct the facilities proposed in this Application and the agencies in which the application for such permits or certificates was filed or is expected to be filed.

### **IX. Notice**

A form of Notice suitable for publication in the *Federal Register* is attached hereto.

### **X. Exhibits**

This is an abbreviated application filed pursuant to Section 157.7 of the Commission's regulations under the NGA, pursuant to which Algonquin has omitted the

exhibits and data that are inapplicable or are unnecessary to disclose fully the nature and extent of the proposal herein. A list of the exhibits and documents filed with this Application, which are incorporated by reference as if set forth fully herein, or which have been omitted for the reasons set forth below, is as follows:

- |             |  |
|-------------|--|
| Exhibit A   | <u>Articles of Incorporation</u><br>Omitted. Exhibit A has been filed in Docket No. CP06-76-000 and is incorporated herein by reference.   |
| Exhibit B   | <u>State Authorization</u><br>Attached hereto is the information related to Algonquin's authority to do business in the State of Maine. Exhibit B has been filed in Docket Nos. CP08-462-000 with respect to the authority to do business in the State of Texas and CP06-76-000 for each other state in which it has authority to do business and such exhibits are incorporated herein by reference.  |
| Exhibit C   | <u>Company Officials</u><br>Attached.  |
| Exhibit D   | <u>Subsidiaries and Affiliates</u><br>Omitted. Exhibit D has been filed in Docket No. CP08-256-000 and is incorporated herein by reference.  |
| Exhibit E   | <u>Other Pending Applications and Filings</u><br>Omitted. This information is contained in Section VIII of this Application.   |
| Exhibit F   | <u>Location of Facilities</u><br>Attached.   |
| Exhibit F-I | <u>Environmental Report</u><br>Attached hereto in Volumes II through IV. Resource Report Nos. 1 through 12 as specified in Sections 380.3 and 380.12 of the Commission's regulations are included herewith. Appendices from Resource Report No. 1 (landowner information) and Resource Report No. 4 (cultural resource assessment) have been segregated and bound separately in Volume III and are labeled "Contains Privileged Information—Do Not Release." |

Exhibits G through G-II	<p><u>Flow Diagrams and Flow Diagram Data</u></p> <p>Attached hereto as part of Volume IV and marked “Contains Critical Energy Infrastructure Information—Do Not Release.”</p>
Exhibit H	<p><u>Total Gas Supply</u></p> <p>Omitted. This information is contained in Section VI of this Application.</p>
Exhibit I	<p><u>Market Data</u></p> <p>Enclosed herewith under seal as part of Volume III and marked “Contains Privileged Information—Do Not Release.” This exhibit includes copies of the Precedent Agreements between Algonquin and the Project Shippers.</p>
Exhibit J	<p><u>Other Federal Authorizations</u></p> <p>Attached. This exhibit identifies the following: each federal authorization that the Project will require; the federal or state agency or officer that will issue each required authorization; the date each request for authorization was submitted; why any request was not submitted and the date submission is expected; and the date by which final action on each federal authorization has been requested or is expected.</p>
Exhibit K	<p><u>Cost of Facilities</u></p> <p>Attached.</p>
Exhibit L	<p><u>Financing</u></p> <p>Omitted. As currently structured, Algonquin will finance the costs of the AIM Project through funds on hand and borrowings under short-term financing arrangements but Algonquin is also considering other financing and ownership options. To the extent that it implements any other arrangement, Algonquin will update its application to reflect specific information.</p>
Exhibit M	<p><u>Construction, Operation and Maintenance</u></p> <p>Omitted. Algonquin will construct or cause the proposed facilities to be constructed, and will manage and operate the proposed facilities.</p>
Exhibit N	<p><u>Revenues, Expenses and Income</u></p> <p>Omitted. This information is included in Exhibit P.</p>

Exhibit O	<p><u>Depreciation and Depletion</u></p> <p>Algonquin will use its system depreciation rate of 1.81 % for the AIM Project facilities. The justification for the depreciation rate of 6.67 % for the West Roxbury Lateral facilities is attached hereto.</p>
Exhibit P	<p><u>Tariff and Rates</u></p> <p><i>Pro forma</i> tariff records setting forth the proposed initial incremental recourse rate and lateral rates, as well as other terms and conditions of service on the AIM Project facilities are included herewith. In addition, Exhibit P includes the support schedules for the derivation of such initial recourse rates.</p>
Exhibit T	<p><u>Related Applications</u></p> <p>Attached.</p>
Exhibit U	<p><u>Contracts and Other Agreements</u></p> <p>Omitted. No contracts or other agreements pertain to the abandonment of the facilities proposed herein.</p>
Exhibit V	<p><u>Flow Diagram after Abandonment</u></p> <p>Attached hereto in Volume IV as Exhibits G through G-II and marked “Contains Critical Energy Infrastructure Information—Do Not Release.”</p>
Exhibit W	<p><u>Impact on Customers</u></p> <p>Omitted. No service to customers will be terminated by the abandonment of the facilities proposed herein.</p>
Exhibit X	<p><u>Effect on Existing Tariffs</u></p> <p>Omitted. No effect upon any of the rate schedules or tariff on file with the Commission for Algonquin will occur from granting the proposed abandonment.</p>
Exhibit Y	<p><u>Accounting Treatment of Abandonment</u></p> <p>Attached.</p>

## **XI. Other**

Algonquin requests that the Commission grant this Application in accordance with the shortened procedures set forth in Rules 801 and 802 of the Commission's Rules of Practice and Procedure. Also, if the Commission utilizes the shortened procedures, Algonquin requests that the intermediate decision procedure be omitted and waives oral hearing and opportunity for filing exceptions.

Exhibits G through G-II, as well as parts of Exhibit F-I, are found in Volume IV and contain Critical Energy Infrastructure Information regarding system pressure and flow. Pursuant to Section 388.112 of the Commission's regulations, Algonquin hereby requests privileged treatment of these exhibits, which are marked as "Contains Critical Energy Infrastructure Information—Do Not Release." In addition, Algonquin is marking Volume III as privileged because it contains cultural resource location information and landowner information from Exhibit F-I, confidential agreements representing market data from Exhibit I, and confidential hydraulic models supporting Exhibits G through G-II.<sup>29</sup> Algonquin requests privileged treatment for this volume and has marked it "Contains Privileged Information—Do Not Release." Algonquin has also submitted herewith the Form of Notice of this Application.

---

<sup>28</sup> See 18 C.F.R. § 388.112(b)(2)(i).

<sup>29</sup> The hydraulic models supporting Exhibits G through G-II are available only in electronic form in WFP format. The hydraulic flow models also contain CEII.

**XII.**  
**Summary of Authorizations Requested**

WHEREFORE, Algonquin respectfully requests that for the reasons set forth herein, the Commission review this Application and issue a final certificate of public convenience and necessity approving the Project as described herein without condition or modification, and approving, authorizing and/or granting Algonquin:

- (i) a certificate of public convenience and necessity to construct, install, own, operate and maintain the facilities, as proposed herein;
- (ii) authorization to abandon by removal certain facilities, as proposed herein;
- (iii) authorization to charge the initial incremental recourse rate and an incremental fuel percentage for firm service on the AIM Project, excluding the West Roxbury Lateral, and existing system recourse rates for interruptible service on such facilities;
- (iv) authorization to charge the initial firm recourse rate and interruptible rate for firm and interruptible service, respectively, on the West Roxbury Lateral; and
- (v) any waivers, authority, and further relief as may be necessary to implement the proposal contained herein.

Algonquin respectfully requests that the Commission issue an order authorizing the requested activities on or before January 31, 2015. Algonquin submits that this schedule for approval of the Application is required so that Algonquin can construct and have the facilities proposed herein in service by November 1, 2016, in order to meet the transportation needs of the Project Shippers for the 2016-17 winter heating season.

Respectfully submitted,

ALGONQUIN GAS TRANSMISSION, LLC

<sup>1</sup>Compressor unit designed with sufficient horsepower to address needs of AIM Project and separate system maintenance project, thereby eliminating duplicative facilities and greater aggregate costs. A credit adjustment was made in the amount of \$2.8 million to Materials so that compressor unit costs allocated to the AIM Project include only costs that would have been incurred absent the need for the incremental compression for the system project and larger horsepower unit.

## **AIM PROJECT**

**DOCKET NO. CP14-\_\_-000**

### **Exhibit O**

Depreciation and Depletion

## Algonquin Incremental Market Project

### West Roxbury Lateral – Depreciation Rate

Algonquin proposes an annual depreciation rate of 6.67% for the West Roxbury Lateral. Given that this lateral is a market lateral with a long-term contract to serve a single customer, Algonquin proposes that the depreciation rate be based on the customer's 15-year contract term. This results in an annual depreciation rate of 6.67%.

## **AIM Expansion Project**

### **Explanatory Notes**

#### **Rate Derivation**

As shown on Schedule 2 herein, the rates proposed for firm service to project shippers of the AIM Project are 100% reservation rates, based on the incremental cost of service developed on Schedules 2 through 12 of this Exhibit P. Algonquin has utilized the expansion capacity of 342,000 Dth/d as the volume determinants for the AIM Project and 100,000 Dth/d as the volume determinants for the West Roxbury Lateral to develop the project rates.

No existing system costs have been assigned to these project rates and none of the incremental cost of service of the new AIM Project facilities is proposed to be included in Algonquin's system rates.

Algonquin has allocated \$500,000 of the West Roxbury Lateral cost of service to be recovered from interruptible customers. The company therefore proposes that no revenue crediting is required for the West Roxbury Lateral interruptible revenues. Further, Algonquin proposes to use the 100% load factor of the firm AFT-CL rate as the maximum rate for interruptible service on the West Roxbury Lateral.

#### **Cost of Service**

The rate of return and other factors used to develop the cost of service in this Exhibit P are the same factors underlying Algonquin's current rates, as approved in Docket No. RP99-262.<sup>1</sup> The factors include an allowed rate of return of 10.37% and a system depreciation rate of 1.81%. Additionally the current federal income tax rate of 35% has been used. As reflected in Exhibit O, Algonquin proposes to use a depreciation rate of 6.67% for the West Roxbury Lateral facilities.

The total capital cost estimate used herein to calculate Algonquin's AIM Project incremental cost of service is \$876,258,578 and for the West Roxbury Lateral cost of service is \$95,293,105, as detailed in Exhibit K.

---

<sup>1</sup> *Algonquin Gas Transmission, LLC*, 87 FERC ¶ 61,008 (1999).

Algonquin proposes to recover fuel use and lost and unaccounted for fuel associated with providing service on the AIM Project facilities, through the incremental Fuel Reimbursement Percentage ("FRP"). The incremental fuel derivation is shown on Exhibit Z-2. Consistent with the Commission's incremental fuel methodology, Algonquin will track changes in fuel costs for this new incremental service on an incremental basis through its FRQ mechanism set forth in Section 32 of its GT&C. Algonquin will adjust its periodic tracker mechanisms to ensure that existing customers do not subsidize the costs resulting from this new incremental service.

#### Tariff Records

This Exhibit P includes updated *pro forma* tariff records for Rate Schedule AFT-1, Statement of Rates, to reflect the proposed incremental rate for the AIM Project, and Rate Schedules AFT-CL and AIT-2, Statement of Rates, to reflect the proposed recourse rates for the West Roxbury Lateral, as well as other tariff records to establish the terms and conditions for service on the AIM Project and the West Roxbury Lateral. The redlined tariff records highlight all changes to the currently effective tariff records. To the extent other changes to these tariff records become effective prior to placing the AIM Project into service, Algonquin will include those changes when filing to place these *pro forma* tariff records into effect.

**RATE SCHEDULE AFT-1**  
**FIRM TRANSPORTATION SERVICE**

1. **AVAILABILITY**

This rate schedule is available for firm transportation of natural gas by Algonquin Gas Transmission, LLC (hereinafter called "Algonquin") for any party (hereinafter called "Customer"), when:

- a. Customer has made a valid request for firm transportation pursuant to Section 2 of the General Terms and Conditions of this FERC Gas Tariff of which this rate schedule is a part;
- b. Sufficient firm capacity is available to effectuate such transportation without any construction of facilities or other investment by Algonquin, or Algonquin has waived this requirement in writing;
- c. The Primary Point(s) of Receipt and Primary Point(s) of Delivery requested by Customer are acceptable to Algonquin from the viewpoint of adequacy of Algonquin's existing facilities to receive and transport Customer's gas with Algonquin's existing firm service taking precedence; and
- d. Customer has executed a service agreement in the form contained in the FERC Gas Tariff of which this rate schedule is a part.
- e. Transportation service effectuated through capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL is not available under this rate schedule; provided, however that the interconnection between the Brayton Point Lateral and Algonquin's mainline (M&R No. 80035), the interconnection between the Manchester Street Lateral and Algonquin's mainline (M&R No. 80071), the interconnection between the Canal Lateral and Algonquin's mainline (M&R No. 8004), the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline (M&R 80095), the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline (M&R No. 80104) are available under this Rate Schedule AFT-1.

2. **APPLICABILITY AND CHARACTER OF SERVICE**

- 2.1 Transportation service hereunder will be on a firm basis except as provided herein and in Sections 16 and 24 of the General Terms and Conditions of this tariff. Algonquin shall receive from Customer, or for the account of Customer, at those

points on Algonquin's system as specified in an executed AFT-1 Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Receipt") for transportation hereunder daily quantities of gas tendered for the account of Customer up to Customer's Maximum Daily Transportation Quantity ("MDTQ") plus an amount reflecting the Fuel Reimbursement Quantity as defined in Section 32 of the General Terms and Conditions of this tariff and, on a cumulative basis in any year, up to Customer's Maximum Annual Transportation Quantity ("MATQ") as specified in the service agreement, except as provided in Section 2.6 herein below, plus amounts reflecting the Fuel Reimbursement Quantity; provided, however, Algonquin shall not be obligated to, but may at its option, receive at any Point(s) of Receipt on any Day a quantity of gas in excess of the applicable Maximum Daily Receipt Obligation ("MDRO") plus any applicable Fuel Reimbursement Quantity, provided that, if more than one Customer requests receipts in excess of its MDRO at a Point of Receipt, and the sum of all such requests exceeds the available capacity at such Point of Receipt, Algonquin shall apportion such receipts in excess of MDRO among such Customers pro rata according to the Customers' firm MDROs at the relevant Point of Receipt.

- 2.2 Upon receipt of such natural gas for Customer's account, Algonquin shall, after making allowance for the Fuel Reimbursement Quantity, transport and deliver hourly quantities of gas required by Customer up to Customer's Maximum Hourly Transportation Quantity ("MHTQ") at those points on Algonquin's system as are specified in an executed AFT-1 Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Delivery"); provided, however, Algonquin shall not be obligated to, but may at its option, deliver at any Point(s) of Delivery an hourly quantity exceeding the MHTQ, and on any Day a quantity of gas in excess of the applicable Maximum Daily Delivery Obligation ("MDDO"), provided that, if more than one Customer requests deliveries in excess of its MDDO at a Point of Delivery, and the sum of all such requests exceeds the available capacity at such Point of Delivery, Algonquin shall apportion such deliveries in excess of MDDO among such Customers pro rata according to the Customers' firm MDDOs at the relevant Point of Delivery.
- 2.3 Provided such quantities have been scheduled in accordance with Section 23 of the General Terms and Conditions, Customer may tender quantities of gas in excess of the MDTQ plus any applicable Fuel Reimbursement Quantity on any Day if in Algonquin's reasonable judgment transportation of such gas can be accomplished by Algonquin without detriment to any other Customer under any of Algonquin's rate schedules. Such excess quantities shall be deemed to be Authorized Overrun Quantities.
- 2.4 Algonquin shall not be obligated to add any facilities or expand the capacity of Algonquin's pipeline system in any manner in order to provide transportation service to Customer pursuant to this rate schedule; provided, however, Algonquin

may, at its option, and with Customer's consent, add facilities or expand capacity to provide such transportation service, subject to Section 42.

- 2.5 Unless otherwise specified in the applicable service agreement, services hereunder shall be available on any day of the year, subject to Customer's MATQ and MDTQ limitations.
- 2.6 With respect to existing service agreements resulting from the conversion pursuant to Order No. 636 of sales and storage service under former Rate Schedules F-1, WS-1, STB and SS-3, subject to Algonquin's firm service obligations from primary points of receipt to primary points of delivery Algonquin shall provide service above Customer's MATQ up to but not in excess of the highest MDTQ on which Customer's Reservation Charge during the currently effective term of the service agreement is based, specified in the executed service agreement multiplied by 365 (366 for a leap year) and, on any Day, Algonquin shall provide service above Customer's current MDTQ for a given season up to but not in excess of the highest MDTQ on which Customer's Reservation Charge during the currently effective term of the service agreement is based provided, however, that such additional quantities shall be provided with the same priority for purposes of scheduling accorded to service meeting the criteria of Section 48.3(a)(1) of the General Terms and Conditions of this tariff only to the extent these quantities are requested to be scheduled from a receipt point located within the Base Flow Path to a delivery point located within the Base Flow Path, and provided further, that for purposes of Curtailment Customer's maximum daily entitlement shall be the highest MDTQ specified in Customer's executed service agreement during the period of Curtailment. Such additional quantities shall be subject to fuel, the applicable commodity rate and any applicable commodity surcharges.

### 3. RATE

- 3.1 Unit Rates. The applicable maximum and minimum unit rates are set forth in the currently effective Statement of Rates for Rate Schedule AFT-1 of this tariff and are hereby incorporated herein. Such rates are subject to adjustment pursuant to Section 33 and Section 34 of the General Terms and Conditions of this tariff. The applicable unit rates to be charged on any Day by Algonquin for gas delivered to Customer shall not be in excess of the maximum unit rate nor less than the minimum unit rate.
- 3.2 Monthly Bill for Forwardhaul Rates. For Customers executing an AFT-1 Service Agreement for transportation which is not solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AFT-1 Service Agreement is effective and for each Month thereafter unless otherwise specified in the applicable service agreement, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:

- (a) Reservation Charge: The charge per Month per Dth of Customer's highest MDTQ during the Contract Year, as specified in Customer's executed AFT-1 Service Agreement; plus
- (b) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
- (c) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
- (d) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (e) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (f) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions; less
- (g) Revenue Credit: The revenue credit provided for in Section 41 of the General Terms and Conditions.

3.3 Monthly Bill for Backhaul Rates. For Customers executing an AFT-1 Service Agreement for transportation which is solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AFT-1 Service Agreement is effective and for each Month thereafter unless otherwise specified in the applicable Service Agreement, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:

- (a) Reservation Charge: The charge per Month per Dth of Customer's highest MDTQ during the Contract Year, as specified in Customer's executed AFT-1 Service Agreement; plus
- (b) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
- (c) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus

- (d) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (e) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (f) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions; less
- (g) Revenue Credit: The revenue credit provided for in Section 41 of the General Terms and Conditions.

#### 4. NOMINATIONS AND SCHEDULING OF RECEIPTS AND DELIVERIES

- 4.1 Nominations and Scheduling. If Customer desires transportation of natural gas on any Day under this rate schedule, Customer shall provide a nomination to Algonquin in accordance with Section 22 of the General Terms and Conditions of this tariff. Based upon the nomination of Customer, Algonquin shall schedule receipts and deliveries of gas in accordance with the General Terms and Conditions. It is the responsibility of Customer to adjust its deliveries and receipts to conform to the scheduled quantities.
- 4.2 Delivery of Gas. Based upon the daily quantity scheduled, Algonquin shall make daily delivery of Customer's scheduled quantity taking into account the Fuel Reimbursement Quantity. It is the intention of Algonquin that daily deliveries of gas at the Point(s) of Delivery by Algonquin hereunder shall be as nearly equal as possible to daily receipts of gas at the Point(s) of Receipt by Algonquin for transportation hereunder, less the applicable Fuel Reimbursement Quantity. Any excess or deficiency in such receipts, less the applicable Fuel Reimbursement Quantity, and deliveries shall be resolved in accordance with the General Terms and Conditions of this tariff. Nothing in this rate schedule shall limit Algonquin's right to take actions pursuant to Section 26 of the General Terms and Conditions of this tariff.
- 4.3 Commingling of Gas. From the time the natural gas is received by Algonquin at the Point(s) of Receipt, Algonquin shall have the unqualified right to commingle such natural gas with other gas in Algonquin's system.

#### 5. OTHER OPERATING CONDITIONS

Algonquin's obligation to provide service under this rate schedule is subject to the following conditions being satisfied:

- 5.1 Customer shall make all necessary arrangements with other parties at or upstream of the Point(s) of Receipt where Customer tenders gas to Algonquin for transportation, and at or downstream of the Point(s) of Delivery where Algonquin delivers gas for Customer's account, and such arrangements must be compatible with Algonquin's system operations.
- 5.2 Algonquin shall schedule receipts at a Secondary Point of Receipt or deliveries at a Secondary Point of Delivery pursuant to the provisions of Sections 48.2 and 48.3 of the General Terms and Conditions.
- 5.3 To the extent that any upstream entity involved in handling Customer's gas refuses or is unable to deliver gas to Algonquin, Algonquin shall not be required to continue deliveries of gas on behalf of Customer. Prior to any reduction or interruption in service due to the failure of the upstream entity to deliver gas on behalf of Customer, Algonquin shall provide notice in a time and manner that is reasonable under then existing conditions. To the extent that any downstream entity involved in handling Customer's gas refuses or is unable to receive gas from Algonquin, Algonquin shall have the right to reduce deliveries of gas on behalf of Customer.
- 5.4 The daily quantities of natural gas transported shall be delivered at the Point(s) of Receipt at an hourly rate of 1/24th of the scheduled daily quantity. The daily quantities of natural gas transported shall be accepted at the Point(s) of Delivery at a substantially constant hourly rate or, in the case of service agreements resulting from the conversion pursuant to Order No. 636 of sales entitlements under former Rate Schedules F-1 and WS-1, at a rate no greater than .06 multiplied by the scheduled daily quantity.

6. POINT(S) OF RECEIPT AND DELIVERY

- 6.1 (A) Primary Points of Receipt: The Primary Point(s) of Receipt at which Algonquin shall receive gas for transportation under this rate schedule shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Primary Point of Receipt the MDRO and receipt pressure obligations. Such exhibit by mutual written agreement may be superseded by a new exhibit which may add or delete specific points or make other changes thereto that the parties deem appropriate. Algonquin shall not accept any proposed Primary Point(s) of Receipt, or quantity at any Primary Point(s) of Receipt, or change in quantities among Primary Point(s) of Receipt if (a) the resulting aggregate MDROs at all of Customer's Primary Point(s) of Receipt would exceed Customer's MDTQ, or (b) in doing so, in Algonquin's reasonable judgment, Algonquin would impair its ability to satisfy its existing firm obligations to receive gas pursuant to other firm service agreements under which such Point(s) of Receipt are Primary Points of Receipt and to purchase and receive its Company Use Gas at

maximum deliverability levels, as such Company Use Gas arrangements exist under agreements effective at the date of Customer's request or reasonably expected by Algonquin to be effective within six months of the request.

- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators for use as a Primary Point of Receipt in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Receipt to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In the event that Replacement Customer selects a new Primary Point of Receipt that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Receipt, shall revert to the Releasing Customer, and any Primary Points of Receipt granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.

- 6.2 Secondary Points of Receipt: Notwithstanding the foregoing, all interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt, with the exception of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline are available as Secondary Points of Receipt under this Rate Schedule

AFT-1. Such use of Secondary Points of Receipt is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.

- 6.3 (A) Primary Points of Delivery: The Primary Point(s) of Delivery at which Algonquin shall deliver gas for Customer's account under this rate schedule shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Point of Delivery the MDDO and delivery pressure obligations. Algonquin shall not accept any proposed Primary Point(s) of Delivery, or quantity at any Primary Point(s) of Delivery, or change in quantities among Primary Point(s) of Delivery if the resulting aggregate MDDOs at all of Customer's Primary Point(s) of Delivery would exceed Customer's MDTQ except to the extent Customer's MDDOs reflect the conversion of pre-existing entitlements under firm sales agreements.
- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators for use as a Primary Point of Delivery in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Delivery to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In the event that Replacement Customer selects a new Primary Point of Delivery that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Delivery, shall revert to the Releasing Customer, and any Primary Points of Delivery granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.
- 6.4 Secondary Points of Delivery: Notwithstanding the foregoing, all interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery, with the exception of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West

Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline are available as Secondary Points of Delivery under this Rate Schedule AFT-1. Such use of Secondary Points of Delivery is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.

7. GENERAL TERMS AND CONDITIONS

The applicable General Terms and Conditions of this FERC Gas Tariff are hereby made a part of this rate schedule.

**RATE SCHEDULE AFT-E**  
**FIRM TRANSPORTATION SERVICE**

1. **AVAILABILITY**

This rate schedule is available for firm transportation of natural gas by Algonquin Gas Transmission, LLC (hereinafter called "Algonquin") for any party (hereinafter called "Customer"), when:

- a. Customer has made a valid request for firm transportation pursuant to Section 2 of the General Terms and Conditions of this FERC Gas Tariff of which this rate schedule is a part;
- b. Sufficient firm capacity is available to effectuate such transportation without any construction of facilities or other investment by Algonquin, or Algonquin has waived this requirement in writing;
- c. The Primary Point(s) of Receipt and Primary Point(s) of Delivery requested by Customer are acceptable to Algonquin from the viewpoint of adequacy of Algonquin's existing facilities to receive and transport Customer's gas with Algonquin's existing firm service taking precedence;
- d. Customer has contracted with one or more operators of upstream facilities that interconnect with the Algonquin system (the "Upstream Entity(ies)"), for a sufficient quantity of no-notice transportation services that encompass the right on the part of Customer to increase or decrease its receipts from the Upstream Entity(ies) into designated Points of Receipt on Algonquin's system with no advance notice, up to Customer's MDTQ under this Rate Schedule AFT-E plus fuel as provided for in Section 32 of the General Terms and Conditions of this tariff in the case of increases in receipts, or down to zero in the case of decreases in receipts, without regard to any quantities that Customer previously scheduled on the Upstream Entities, and with no requirement that Customer adhere to a constant rate of flow on the Upstream Entities (the "Upstream Arrangements").
- e. Customer has named a contact party (the "Notice Agent") for the receipt of orders issued in accordance with Section 5 ("Section 5 Orders") of this rate schedule;
- f. Customer has authorized Algonquin to exercise Customer's nomination and scheduling rights under the Upstream Arrangements, if necessary by executing agency instruments satisfactory to the Upstream Entity, to the extent required to permit service under this rate schedule; and
- g. Customer has executed a service agreement in the form contained in the FERC Gas Tariff of which this rate schedule is a part.

- h. Transportation service effectuated through capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL is not available under this rate schedule; provided, however that the interconnection between the Brayton Point Lateral and Algonquin's mainline (M&R No. 80035), the interconnection between the Manchester Street Lateral and Algonquin's mainline (M&R No. 80071), the interconnection between the Canal Lateral and Algonquin's mainline (M&R No. 8004), the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline (M&R No. 80095), the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline (M&R No. 80104) are available under this Rate Schedule AFT-E.

## 2. APPLICABILITY AND CHARACTER OF SERVICE

- 2.1 Transportation service hereunder will be on a firm basis except as provided herein and in Sections 16 and 24 of the General Terms and Conditions of this tariff. Algonquin shall receive from Customer, or for the account of Customer, at those points on Algonquin's system as specified in an executed AFT-E Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Receipt") for transportation hereunder daily quantities of gas tendered for the account of Customer up to Customer's Maximum Daily Transportation Quantity ("MDTQ") plus an amount reflecting the Fuel Reimbursement Quantity as defined in Section 32 of the General Terms and Conditions of this tariff and, on a cumulative basis in any year, up to Customer's Maximum Annual Transportation Quantity ("MATQ") as specified in the service agreement, except as provided in Section 2.7 herein below, plus amounts reflecting the Fuel Reimbursement Quantity; provided however, Algonquin shall not be obligated to, but may at its option, receive at any Point(s) of Receipt on any Day a quantity of gas in excess of the applicable Maximum Daily Receipt Obligation ("MDRO") plus any applicable Fuel Reimbursement Quantity, provided that, if more than one Customer requests receipts in excess of its MDRO at a Point of Receipt, and the sum of all such requests exceeds the available capacity at such Point of Receipt, Algonquin shall apportion such receipts in excess of MDRO among such Customers pro rata according to the Customers' firm MDROs at the relevant Point of Receipt.
- 2.2 Upon receipt of such natural gas for Customer's account, Algonquin shall, after making allowance for the Fuel Reimbursement Quantity, transport and deliver hourly quantities of gas required by Customer up to Customer's Maximum Hourly Transportation Quantity ("MHTQ") at those points on Algonquin's system as are specified in an executed AFT-E Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Delivery"); provided however,

Algonquin shall not be obligated to, but may at its option, deliver at any Point(s) of Delivery an hourly quantity exceeding the MHTQ, and on any Day a quantity of gas in excess of the applicable Maximum Daily Delivery Obligation ("MDDO"), provided that, if more than one Customer requests deliveries in excess of its MDDO at a Point of Delivery, and the sum of all such requests exceeds the available capacity at such Point of Delivery, Algonquin shall apportion such deliveries in excess of MDDO among such Customers pro rata according to the Customers' firm MDDOs at the relevant Point of Delivery.

- 2.3 Provided such quantities have been scheduled in accordance with Section 23 of the General Terms and Conditions, Customer may tender quantities of gas in excess of the MDTQ plus any applicable Fuel Reimbursement Quantity on any Day if in Algonquin's reasonable judgment transportation of such gas can be accomplished by Algonquin without detriment to any other Customer under any of Algonquin's rate schedules. Such excess quantities shall be deemed to be Authorized Overrun Quantities.
- 2.4 Algonquin shall not be obligated to add any facilities or expand the capacity of Algonquin's pipeline system in any manner in order to provide transportation service to Customer pursuant to this rate schedule; provided, however, Algonquin may, at its option, and with Customer's consent, add facilities or expand capacity to provide such transportation service, subject to Section 42.
- 2.5 Subject to the conditions specified in Section 5 of this Rate Schedule, service hereunder shall encompass the right on the part of Customer to increase deliveries at the Point(s) of Delivery up to the MDTQ and to decrease deliveries at the Point(s) of Delivery without advance notice to Algonquin and without Customer's previously having provided for a concurrent increase or decrease in receipts at the Point(s) of Receipt.
- 2.6 Unless otherwise specified in the applicable service agreement, service hereunder shall be available on any day of the year, subject to Customer's MATQ and MDTQ limitations.
- 2.7 With respect to existing service agreements resulting from the conversion pursuant to Order No. 636 of sales and storage service under former Rate Schedules F-1, WS-1, STB and SS-3, subject to Algonquin's firm service obligations from primary points of receipt to primary points of delivery Algonquin shall provide service above Customer's MATQ up to but not in excess of the highest MDTQ on which Customer's Reservation Charge during the currently effective term of the service agreement is based, specified in the executed service agreement multiplied by 365 (366 for a leap year) and, on any Day, Algonquin shall provide service above Customer's current MDTQ for a given season up to but not in excess of the highest MDTQ on which Customer's Reservation Charge during the currently effective term of the service agreement is based; provided, however, that such additional quantities shall be provided with

the same priority for purposes of scheduling accorded to service meeting the criteria of Section 48.3(a)(1) of the General Terms and Conditions of this tariff only to the extent these quantities are requested to be scheduled from a receipt point located within the Base Flow Path to a delivery point located within the Base Flow Path, and provided further, that for purposes of Curtailment Customer's maximum daily entitlement shall be the highest MDTQ specified in Customer's executed service agreement during the period of Curtailment. Such additional quantities shall be subject to fuel, the applicable commodity rate and any applicable commodity surcharges.

### 3. RATE

- 3.1 Unit Rates. The applicable maximum and minimum unit rates are set forth in the currently effective Statement of Rates for Rate Schedule AFT-E of this tariff and are hereby incorporated herein. Such rates are subject to adjustment pursuant to Section 33 and Section 34 of the General Terms and Conditions of this tariff. The applicable unit rates to be charged on any Day by Algonquin for gas delivered to Customer shall not be in excess of the maximum unit rate nor less than the minimum unit rate.
- 3.2 Monthly Bill for Forwardhaul Rates. For Customers executing an AFT-E Service Agreement for transportation which is not solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AFT-E Service Agreement is effective and for each Month thereafter unless otherwise specified in the applicable service agreement, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:
- (a) Reservation Charge: The charge per Month per Dth of Customer's highest MDTQ during the Contract Year, as specified in Customer's executed AFT-E Service Agreement; plus
  - (b) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
  - (c) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
  - (d) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
  - (e) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus

- (f) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions; less
- (g) Revenue Credit: The revenue credit provided for in Section 41 of the General Terms and Conditions.

3.3 Monthly Bill for Backhaul Rates. For Customers executing an AFT-E Service Agreement for transportation which is solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AFT-E Service Agreement is effective and for each Month thereafter unless otherwise specified in the applicable Service Agreement, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:

- (a) Reservation Charge: The charge per Month per Dth of Customer's highest MDTQ during the Contract Year, as specified in Customer's executed AFT-E Service Agreement; plus
- (b) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
- (c) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
- (d) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (e) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (f) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions; less
- (g) Revenue Credit: The revenue credit provided for in Section 41 of the General Terms and Conditions.

#### 4. NOMINATIONS AND SCHEDULING OF RECEIPTS AND DELIVERIES

4.1 Nominations and Scheduling. If Customer desires transportation of natural gas on any Day under this rate schedule, Customer shall provide a nomination to

Algonquin in accordance with Section 22 of the General Terms and Conditions of this tariff. Based upon the nomination of Customer, Algonquin shall schedule receipts and deliveries of gas in accordance with the General Terms and Conditions. It is the responsibility of Customer to adjust its deliveries and receipts to conform to the scheduled quantities.

- 4.2 Delivery of Gas. Based upon the daily quantity scheduled and in accordance with Section 5 herein, Algonquin shall make daily delivery of Customer's scheduled quantity taking into account the Fuel Reimbursement Quantity. It is the intention of Algonquin that daily deliveries of gas at the Point(s) of Delivery by Algonquin hereunder shall be as nearly equal as possible to daily receipts of gas at the Point(s) of Receipt by Algonquin for transportation hereunder, less the applicable Fuel Reimbursement Quantity. Any excess or deficiency in such receipts, less the applicable Fuel Reimbursement Quantity, and deliveries shall be resolved in accordance with the General Terms and Conditions of this tariff. Nothing in this rate schedule shall limit Algonquin's right to take actions pursuant to Section 26 of the General Terms and Conditions of this tariff.
- 4.3 No-Notice Service. Notwithstanding the quantities nominated by Customer and scheduled by Algonquin hereunder, Customer shall be entitled to increase its deliveries up to the MDDO at any point, up to the MHTQ during any Hour, and up to the MDTQ, or to decrease its deliveries. Provided that all of the operational conditions specified in Section 5 of this rate schedule (the "Section 5 Conditions") are met, Algonquin shall consent to such increase or decrease in deliveries, thereby nullifying any daily scheduling or hourly scheduling penalty that would otherwise be applicable pursuant to Section 23 of the General Terms and Conditions. Furthermore, if the Section 5 Conditions are met, Algonquin will forbear from taking action pursuant to Section 26 of the General Terms and Conditions to reduce deliveries to Customer. If any of the Section 5 Conditions are not met, Algonquin shall not be required to receive or deliver gas in amounts other than the transportation quantities scheduled by Customer, and variations between scheduled quantities and actual deliveries to Customer's meter shall be subject to the assessment of penalties pursuant to Section 23 of the General Terms and Conditions.
- 4.4 Commingling of Gas. From the time the natural gas is received by Algonquin at the Point(s) of Receipt, Algonquin shall have the unqualified right to commingle such natural gas with other gas in Algonquin's system.

## 5. OTHER OPERATING CONDITIONS

Algonquin's obligation to provide service under this rate schedule is subject to the following conditions being satisfied:

- 5.1 Customer shall make all necessary arrangements, including the Upstream Arrangements, with other parties at or upstream of the Point(s) of Receipt where

Customer tenders gas to Algonquin for transportation, and at or downstream of the Point(s) of Delivery where Algonquin delivers gas for Customer's account, and such arrangements must be compatible with Algonquin's system operations.

- 5.2 Algonquin shall schedule receipts at a Secondary Point of Receipt or deliveries at a Secondary Point of Delivery pursuant to the provisions of Sections 48.2 and 48.3 of the General Terms and Conditions.
- 5.3 To the extent that any Upstream Entity involved in handling Customer's gas refuses or is unable to deliver gas to Algonquin, Algonquin shall not be required to continue deliveries of gas on behalf of Customer. Prior to any reduction or interruption in service due to the failure of the Upstream Entity to deliver gas on behalf of Customer, Algonquin shall provide notice in a time and manner that is reasonable under then existing conditions. To the extent that any downstream entity involved in handling Customer's gas refuses or is unable to receive gas from Algonquin, Algonquin shall have the right to reduce deliveries of gas on behalf of Customer.
- 5.4 The Upstream Arrangements must be in full force and effect; Customer shall not be in default of the Upstream Arrangements; and Customer's rights under the Upstream Arrangements shall be enforceable by Customer or its agents without impairment due to curtailment, force majeure or other reasons.
- 5.5 The Upstream Entity(ies) shall recognize Algonquin's rights as Customer's agent to issue orders ("Section 5 Orders") on Customer's behalf nominating or directing for Customer's account no-notice service as encompassed within the Upstream Arrangements at such levels and at such times as Algonquin determines in its reasonable discretion is required by the Algonquin system to meet the needs of Customer under this rate schedule.
- 5.6 All Upstream Entities involved in all Upstream Arrangements with Customer served under this rate schedule shall deliver to the various points of interconnection between Algonquin's facilities and the facilities of the various Upstream Entities such quantities of gas at such times as Algonquin determines in its reasonable discretion are required by the Algonquin system to meet the needs of Customer under this rate schedule.
- 5.7 Customer's Notice Agent must have complete authority to call upon supplies for Customer's account at such times, in such quantities, and at such locations as Algonquin deems necessary, in its reasonable discretion, to enable Algonquin to provide service as contemplated for Customer under this rate schedule.
- 5.8 All Notice Agents named by Customer under this rate schedule shall execute Section 5 Orders at such locations and at such times as Algonquin determines in its reasonable discretion are necessary to enable Algonquin to provide service as contemplated under Rate Schedules AFT-E and AFT-ES.

- 5.9 The daily quantities of natural gas transported shall be delivered at the Point(s) of Receipt at an hourly rate of 1/24th of the scheduled daily quantity. The daily quantities of natural gas transported shall be accepted at the Point(s) of Delivery at a substantially constant hourly rate or, in the case of service agreements resulting from the conversion pursuant to Order No. 636 of sales entitlements under former Rate Schedules F-1 and WS-1, at an hourly rate no greater than .06 multiplied by the scheduled daily quantity.
- 5.10 In the event Customer has multiple upstream no-notice services pursuant to more than one contract, from more than one pipeline, or under more than one rate schedule, Customer shall provide Algonquin a predetermined order of preference for these upstream services. Algonquin shall follow this order of preference in scheduling Customer's upstream no-notice service. Customer may, upon twenty-four hours' written notice to Algonquin, modify this specification of scheduling preferences.
- 5.11 In the event Algonquin issues a Section 5 Order on Customer's behalf, Algonquin shall provide notice as soon as possible to Customer and Customer's Notice Agent by telephone or facsimile and by posting on the Internet Web Site that the Section 5 Order has been issued.

6. POINT(S) OF RECEIPT AND DELIVERY

- 6.1 (A) Primary Points of Receipt: The Primary Point(s) of Receipt at which Algonquin shall receive gas for transportation under this rate schedule shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Primary Point of Receipt the MDRO and receipt pressure obligations. Such exhibit by mutual written agreement may be superseded by a new exhibit which may add or delete specific points or make other changes thereto that the parties deem appropriate. Algonquin shall not accept any proposed Primary Point(s) of Receipt, or quantity at any Primary Point(s) of Receipt, or change in quantities among Primary Point(s) of Receipt if (a) the resulting aggregate MDROs at all of Customer's Primary Point(s) of Receipt would exceed Customer's MDTQ, or (b) in doing so, in Algonquin's reasonable judgment, Algonquin would impair its ability to satisfy its existing firm obligations to receive gas pursuant to other firm service agreements under which such Point(s) of Receipt are Primary Points of Receipt and to purchase and receive its Company Use Gas at maximum deliverability levels, as such Company Use Gas arrangements exist under agreements effective at the date of Customer's request or reasonably expected by Algonquin to be effective within six months of the request.

- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators for use as a Primary Point of Receipt in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Receipt to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In the event that Replacement Customer selects a new Primary Point of Receipt that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Receipt, shall revert to the Releasing Customer, and any Primary Points of Receipt granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.

- 6.2 Secondary Points of Receipt: Notwithstanding the foregoing, all interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt, with the exception of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, the interconnection between the Middletown Lateral and the Kleen Energy Lateral, are available as Secondary Points of Receipt, and the interconnection between the West Roxbury Lateral and Algonquin's mainline under this Rate Schedule AFT-E. Such use of Secondary Points of Receipt is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.
- 6.3 (A) Primary Points of Delivery: The Primary Point(s) of Delivery at which Algonquin shall deliver gas for Customer's account under this rate

schedule shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Point of Delivery the MDDO and delivery pressure obligations. Algonquin shall not accept any proposed Primary Point(s) of Delivery, or quantity at any Primary Point(s) of Delivery, or change in quantities among Primary Point(s) of Delivery if the resulting aggregate MDDOs at all of Customer's Primary Point(s) of Delivery would exceed Customer's MDTQ except to the extent Customer's MDDOs reflect the conversion of pre-existing entitlements under firm sales agreements.

- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators for use as a Primary Point of Delivery in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Delivery to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In the event that Replacement Customer selects a new Primary Point of Delivery that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Delivery, shall revert to the Releasing Customer, and any Primary Points of Delivery granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.

- 6.4 Secondary Points of Delivery: Notwithstanding the foregoing, all interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery, with the exception of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway

Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline are available as Secondary Points of Delivery under this Rate Schedule AFT-E. Such use of Secondary Points of Delivery is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.

7. INDEMNIFICATION

- 7.1 Customer acknowledges that as a result of Section 5 Orders issued to Customer's Upstream Entity or Notice Agent hereunder, Customer may incur imbalances between receipts and deliveries that will be cashed out at Month's end pursuant to Section 25 of the General Terms and Conditions of this tariff. Algonquin shall provide Customer with notice of an imbalance in a timely manner. Customer shall hold Algonquin harmless and indemnify Algonquin against any claim by Customer or otherwise arising out of the incurrance of imbalances as a result of Algonquin's issuance of Section 5 Orders.
- 7.2 Customer acknowledges that the exercise by Algonquin of its agency authority with respect to the Upstream Arrangements may cause the Upstream Entity to assess imbalance cash-out charges and transportation usage, storage injection, storage withdrawal or other charges against Customer. Customer shall hold Algonquin harmless and indemnify Algonquin against any liability whatsoever from any party whatsoever as a result of Algonquin's exercise of its agency authority with respect to the Upstream Arrangements hereunder.
- 7.3 Customer acknowledges that Notice Agent's execution of Section 5 Orders may cause upstream transporters or suppliers to assess charges against Customer for gas costs, transportation services, storage services, imbalance cash out or otherwise. Customer shall hold Algonquin harmless and indemnify Algonquin against any liability whatsoever from any party whatsoever as a result of Algonquin's issuance of Section 5 Orders to the Notice Agent, and the Notice Agent's performance or non-performance of its duties.
- 7.4 Notwithstanding the other provisions of this Section 7, Algonquin is not absolved from liability arising as a result of negligence on the part of Algonquin.

8. GENERAL TERMS AND CONDITIONS

The applicable General Terms and Conditions of this FERC Gas Tariff are hereby made a part of this rate schedule.

**RATE SCHEDULE AFT-1S**  
**FIRM TRANSPORTATION SERVICE**

1. **AVAILABILITY**

This rate schedule is available for firm transportation of natural gas by Algonquin Gas Transmission, LLC (hereinafter called "Algonquin") for any party (hereinafter called "Customer"), when:

- a. Customer's total MDTQ under all Algonquin firm rate schedules is 10,000 Dth or less per Day;
- b. Customer's sole source of transportation service deliveries is Algonquin;
- c. Customer has made a valid request for firm transportation pursuant to Section 2 of the General Terms and Conditions of this FERC Gas Tariff of which this rate schedule is a part;
- d. Sufficient firm capacity is available to effectuate such transportation without any construction of facilities or other investment by Algonquin, or Algonquin has waived this requirement in writing;
- e. The Primary Point(s) of Receipt and Primary Point(s) of Delivery requested by Customer are acceptable to Algonquin from the viewpoint of adequacy of Algonquin's existing facilities to receive and transport Customer's gas with Algonquin's existing firm service taking precedence; and
- f. Customer has executed a Service Agreement in the form contained in the FERC Gas Tariff of which this rate schedule is a part.
- g. Transportation service effectuated through capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL is not available under this rate schedule; provided, however that the interconnection between the Brayton Point Lateral and Algonquin's mainline (M&R No. 80035), the interconnection between the Manchester Street Lateral and Algonquin's mainline (M&R No. 80071), the interconnection between the Canal Lateral and Algonquin's mainline (M&R No. 8004), the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline (M&R No. 80095), the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline (M&R No. 80104) are available under this Rate Schedule AFT-1S.

## 2. APPLICABILITY AND CHARACTER OF SERVICE

- 2.1 Transportation service hereunder will be on a firm basis except as provided herein and in Sections 16 and 24 of the General Terms and Conditions of this tariff. Algonquin shall receive from Customer, or for the account of Customer, at those points on Algonquin's system as specified in an executed AFT-1S Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Receipt") for transportation hereunder daily quantities of gas tendered for the account of Customer up to Customer's Maximum Daily Transportation Quantity ("MDTQ") plus an amount reflecting the Fuel Reimbursement Quantity as defined in Section 32 of the General Terms and Conditions of this tariff and, on a cumulative basis in any year, up to Customer's Maximum Annual Transportation Quantity ("MATQ") as specified in the service agreement, except as provided in Section 2.7 herein below, plus amounts reflecting the Fuel Reimbursement Quantity; provided however, Algonquin shall not be obligated to, but may at its option, receive at any Point(s) of Receipt on any Day a quantity of gas in excess of the applicable Maximum Daily Receipt Obligation ("MDRO") plus any applicable Fuel Reimbursement Quantity, provided that, if more than one Customer requests receipts in excess of its MDRO at a Point of Receipt, and the sum of all such requests exceeds the available capacity at such Point of Receipt, Algonquin shall apportion such receipts in excess of MDRO among such Customers pro rata according to the Customers' firm MDROs at the relevant Point of Receipt.
- 2.2 Upon receipt of such natural gas for Customer's account, Algonquin shall, after making allowance for the Fuel Reimbursement Quantity, transport and deliver hourly quantities of gas required by Customer up to Customer's Maximum Hourly Transportation Quantity ("MHTQ") at those points on Algonquin's system as are specified in an executed AFT-1S Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Delivery"); provided however, Algonquin shall not be obligated to, but may at its option, deliver at any Point(s) of Delivery an hourly quantity exceeding the MHTQ, and on any Day a quantity of gas in excess of the applicable Maximum Daily Delivery Obligation ("MDDO"), provided that, if more than one Customer requests deliveries in excess of its MDDO at a Point of Delivery, and the sum of all such requests exceeds the available capacity at such Point of Delivery, Algonquin shall apportion such deliveries in excess of MDDO among such Customers pro rata according to the Customers' firm MDDOs at the relevant Point of Delivery.
- 2.3 Provided such quantities have been scheduled in accordance with Section 23 of the General Terms and Conditions, Customer may tender quantities of gas in excess of the MDTQ plus any applicable Fuel Reimbursement Quantity on any Day if in Algonquin's reasonable judgment transportation of such gas can be accomplished by Algonquin without detriment to any other Customer under any of Algonquin's rate schedules. Such excess quantities shall be deemed to be Authorized Overrun Quantities.

- 2.4 A Customer executing a service agreement under this Rate Schedule AFT-1S has the right to make an election to convert its service in its entirety from firm transportation service under this rate schedule to firm transportation service under Rate Schedule AFT-1 by providing written notice of such election on or before June 1 of any year. As part of such conversion, such converting Customer has the right to reduce its MDTQ to be applicable under Rate Schedule AFT-1 upon such written notice of its election to convert. Such conversion and reduction shall be effective as of November 1 of that year.
- 2.5 Algonquin shall not be obligated to add any facilities or expand the capacity of Algonquin's pipeline system in any manner in order to provide transportation service to Customer pursuant to this rate schedule; provided, however, Algonquin may, at its option, and with Customer's consent, add facilities or expand capacity to provide such transportation service, subject to Section 42.
- 2.6 Unless otherwise specified in the applicable service agreement, service hereunder shall be available on any day of the year, subject to Customer's MATQ and MDTQ limitations.
- 2.7 With respect to existing service agreements resulting from the conversion pursuant to Order No. 636 of sales and storage service under former Rate Schedules F-1, WS-1, STB and SS-3, subject to Algonquin's firm service obligations from primary points of receipt to primary points of delivery Algonquin shall provide service above Customer's MATQ up to but not in excess of the highest MDTQ on which Customer's Reservation Charge during the currently effective term of the service agreement is based, specified in the executed service agreement multiplied by 365 (366 for a leap year) and, on any Day, Algonquin shall provide service above Customer's current MDTQ for a given season up to but not in excess of the highest MDTQ on which Customer's Reservation Charge during the currently effective term of the service agreement is based; provided, however, that such additional quantities shall be provided with the same priority for purposes of scheduling accorded to service meeting the criteria of Section 48.3(a)(1) of the General Terms and Conditions of this tariff only to the extent these quantities are requested to be scheduled from a receipt point located within the Base Flow Path to a delivery point located within the Base Flow Path, and provided further, that for purposes of Curtailment Customer's maximum daily entitlement shall be the highest MDTQ specified in Customer's executed service agreement during the period of Curtailment. Such additional quantities shall be subject to fuel, the applicable commodity rate and any applicable commodity surcharges.

### 3. RATE

- 3.1 Unit Rates. The applicable maximum and minimum unit rates are set forth in the currently effective Statement of Rates for Rate Schedule AFT-1S of this tariff and

are hereby incorporated herein. Such rates are subject to adjustment pursuant to Section 33 and Section 34 of the General Terms and Conditions of this tariff.

The applicable unit rates to be charged on any Day by Algonquin for gas delivered to Customer shall not be in excess of the maximum unit rate nor less than the minimum unit rate.

3.2 Monthly Bill for Forwardhaul Rates. For Customers executing an AFT-1S Service Agreement for transportation which is not solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AFT-1S Service Agreement is effective and for each Month thereafter unless otherwise specified in the applicable Service Agreement, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:

- (a) Reservation Charge: The charge per Month per Dth of Customer's highest MDTQ during the Contract Year, as specified in Customer's executed AFT-1S Service Agreement; plus
- (b) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
- (c) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
- (d) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (e) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (f) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions; less
- (g) Revenue Credit: The revenue credit provided for in Section 41 of the General Terms and Conditions.

3.3 Monthly Bill for Backhaul Rates. For Customers executing an AFT-1S Service Agreement for transportation which is solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AFT-1S Service Agreement is effective and for each Month thereafter unless otherwise specified in the applicable Service

Agreement, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:

- (a) Reservation Charge: The charge per Month per Dth of Customer's highest MDTQ during the Contract Year, as specified in Customer's executed AFT-1S Service Agreement; plus
- (b) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
- (c) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
- (d) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (e) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (f) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions; less
- (g) Revenue Credit: The revenue credit provided for in Section 41 of the General Terms and Conditions.

#### 4. NOMINATIONS AND SCHEDULING OF RECEIPTS AND DELIVERIES

- 4.1 Nominations and Scheduling. If Customer desires transportation of natural gas on any Day under this rate schedule, Customer shall provide a nomination to Algonquin in accordance with Section 22 of the General Terms and Conditions of this tariff. Based upon the nomination of Customer, Algonquin shall schedule receipts and deliveries of gas in accordance with the General Terms and Conditions. It is the responsibility of Customer to adjust its deliveries and receipts to conform to the scheduled quantities.
- 4.2 Delivery of Gas. Based upon the daily quantity scheduled, Algonquin shall make daily delivery of Customer's scheduled quantity taking into account the Fuel Reimbursement Quantity. It is the intention of Algonquin that daily deliveries of gas at the Point(s) of Delivery by Algonquin hereunder shall be as nearly equal as possible to daily receipts of gas at the Point(s) of Receipt by Algonquin for transportation hereunder, less the applicable Fuel Reimbursement Quantity. Any excess or deficiency in such receipts, less the applicable Fuel Reimbursement

Quantity, and deliveries shall be resolved in accordance with the General Terms and Conditions of this tariff. Nothing in this rate schedule shall limit Algonquin's right to take actions pursuant to Section 26 of the General Terms and Conditions of this tariff.

- 4.3 Commingling of Gas. From the time the natural gas is received by Algonquin at the Point(s) of Receipt, Algonquin shall have the unqualified right to commingle such natural gas with other gas in Algonquin's system.

5. OTHER OPERATING CONDITIONS

Algonquin's obligation to provide service under this rate schedule is subject to the following conditions being satisfied:

- 5.1 Customer shall make all necessary arrangements with other parties at or upstream of the Point(s) of Receipt where Customer tenders gas to Algonquin for transportation, and at or downstream of the Point(s) of Delivery where Algonquin delivers gas for Customer's account, and such arrangements must be compatible with Algonquin's system operations.
- 5.2 Algonquin shall schedule receipts at a Secondary Point of Receipt or deliveries at a Secondary Point of Delivery pursuant to the provisions of Sections 48.2 and 48.3 of the General Terms and Conditions.
- 5.3 To the extent that any upstream entity involved in handling Customer's gas refuses or is unable to deliver gas to Algonquin, Algonquin shall not be required to continue deliveries of gas on behalf of Customer. Prior to any reduction or interruption in service due to the failure of the upstream entity to deliver gas on behalf of Customer, Algonquin shall provide notice in a time and manner that is reasonable under then existing conditions. To the extent that any downstream entity involved in handling Customer's gas refuses or is unable to receive gas from Algonquin, Algonquin shall have the right to reduce deliveries of gas on behalf of Customer.
- 5.4 The daily quantities of natural gas transported shall be delivered at the Point(s) of Receipt at an hourly rate of 1/24th of the scheduled daily quantity. The daily quantities of natural gas transported shall be accepted at the Point(s) of Delivery at a substantially constant hourly rate or, in the case of service agreements resulting from the conversion pursuant to Order No. 636 of sales entitlements under former Rate Schedules F-1 and WS-1, at a rate no greater than .06 multiplied by the scheduled daily quantity.

6. POINT(S) OF RECEIPT AND DELIVERY

- 6.1 (A) Primary Points of Receipt: The Primary Point(s) of Receipt at which Algonquin shall receive gas for transportation under this rate schedule

shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Primary Point of Receipt the MDRO and receipt pressure obligations. Such exhibit by mutual written agreement may be superseded by a new exhibit which may add or delete specific points or make other changes thereto that the parties deem appropriate. Algonquin shall not accept any proposed Primary Point(s) of Receipt, or quantity at any Primary Point(s) of Receipt, or change in quantities among Primary Point(s) of Receipt if (a) the resulting aggregate MDROs at all of Customer's Primary Point(s) of Receipt would exceed Customer's MDTQ, or (b) in doing so, in Algonquin's reasonable judgment, Algonquin would impair its ability to satisfy its existing firm obligations to receive gas pursuant to other firm service agreements under which such Point(s) of Receipt are Primary Points of Receipt and to purchase and receive its Company Use Gas at maximum deliverability levels, as such Company Use Gas arrangements exist under agreements effective at the date of Customer's request or reasonably expected by Algonquin to be effective within six months of the request.

- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators for use as a Primary Point of Receipt in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Receipt to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In the event that Replacement Customer selects a new Primary Point of Receipt that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Receipt, shall revert to the Releasing Customer, and any Primary Points of Receipt granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.

- 6.2 Secondary Points of Receipt: Notwithstanding the foregoing, all interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt, with the exception

of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline are available as Secondary Points of Receipt under this Rate Schedule AFT-1S. Such use of Secondary Points of Receipt is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.

- 6.3 (A) Primary Points of Delivery: The Primary Point(s) of Delivery at which Algonquin shall deliver gas for Customer's account under this rate schedule shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Primary Point of Delivery the MDDO and delivery pressure obligations. Algonquin shall not accept any proposed Primary Point(s) of Delivery, or quantity at any Primary Point(s) of Delivery, or change in quantities among Primary Point(s) of Delivery if the resulting aggregate MDDOs at all of Customer's Primary Point(s) of Delivery would exceed Customer's MDTQ except to the extent Customer's MDDOs reflect the conversion of pre-existing entitlements under firm sales agreements.
- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators for use as a Primary Point of Delivery in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Delivery to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In the event that Replacement Customer selects a new Primary Point of Delivery that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by

Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Delivery, shall revert to the Releasing Customer, and any Primary Points of Delivery granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.

- 6.4 Secondary Points of Delivery: Notwithstanding the foregoing, all interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery, with the exception of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline are available as Secondary Points of Delivery under this Rate Schedule AFT-1S. Such use of Secondary Points of Delivery is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.

7. GENERAL TERMS AND CONDITIONS

The applicable General Terms and Conditions of this FERC Gas Tariff are hereby made a part of this rate schedule.

**RATE SCHEDULE AFT-ES**  
**FIRM TRANSPORTATION SERVICE**

1. **AVAILABILITY**

This rate schedule is available for firm transportation of natural gas by Algonquin Gas Transmission, LLC (hereinafter called "Algonquin") for any party (hereinafter called "Customer"), when:

- a. Customer's total MDTQ under all Algonquin firm rate schedules is 10,000 Dth or less per Day;
- b. Customer's sole source of transportation service deliveries is Algonquin;
- c. Customer has made a valid request for firm transportation pursuant to Section 2 of the General Terms and Conditions of this FERC Gas Tariff of which this rate schedule is a part;
- d. Sufficient firm capacity is available to effectuate such transportation without any construction of facilities or other investment by Algonquin, or Algonquin has waived this requirement in writing;
- e. The Primary Point(s) of Receipt and Primary Point(s) of Delivery requested by Customer are acceptable to Algonquin from the viewpoint of adequacy of Algonquin's existing facilities to receive and transport Customer's gas with Algonquin's existing firm service taking precedence;
- f. Customer has contracted with one or more operators of upstream facilities that interconnect with the Algonquin system (the "Upstream Entity(ies)"), for a sufficient quantity of no-notice transportation services that encompass the right on the part of Customer to increase or decrease its receipts from the Upstream Entity(ies) into designated Points of Receipt on Algonquin's system with no advance notice, up to Customer's MDTQ under this Rate Schedule AFT-ES plus fuel as provided for in Section 32 of the General Terms and Conditions of this tariff in the case of increases in receipts, or down to zero in the case of decreases in receipts, without regard to any quantities that Customer previously scheduled on the Upstream Entity(ies), and with no requirement that Customer adhere to a constant rate of flow on the Upstream Entity(ies) (the "Upstream Arrangements");
- g. Customer has named a contact party (the "Notice Agent") for the receipt of orders issued in accordance with Section 5 ("Section 5 Orders") of this rate schedule;
- h. Customer has authorized Algonquin to exercise Customer's nomination and scheduling rights under the Upstream Arrangements, if necessary by executing agency instruments satisfactory to the Upstream Entity, to the extent required to permit service under this rate schedule; and

- i. Customer has executed a service agreement in the form contained in the FERC Gas Tariff of which this rate schedule is a part.
- j. Transportation service effectuated through capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL is not available under this rate schedule; provided, however that the interconnection between the Brayton Point Lateral and Algonquin's mainline (M&R No. 80035), the interconnection between the Manchester Street Lateral and Algonquin's mainline (M&R No. 80071), the interconnection between the Canal Lateral and Algonquin's mainline (M&R No. 8004), the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline (M&R No. 80095), the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline (M&R No. 80104) are available under this Rate Schedule AFT-ES.

## 2. APPLICABILITY AND CHARACTER OF SERVICE

- 2.1 Transportation service hereunder will be on a firm basis except as provided herein and in Sections 16 and 24 of the General Terms and Conditions of this tariff. Algonquin shall receive from Customer, or for the account of Customer, at those points on Algonquin's system as specified in an executed AFT-ES Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Receipt") for transportation hereunder daily quantities of gas tendered for the account of Customer up to Customer's Maximum Daily Transportation Quantity ("MDTQ") plus an amount reflecting the Fuel Reimbursement Quantity as defined in Section 32 of the General Terms and Conditions of this tariff and, on a cumulative basis in any year, up to Customer's Maximum Annual Transportation Quantity ("MATQ") as specified in the service agreement, except as provided in Section 2.8 herein below, plus amounts reflecting the Fuel Reimbursement Quantity; provided however, Algonquin shall not be obligated to, but may at its option, receive at any Point(s) of Receipt on any Day a quantity of gas in excess of the applicable Maximum Daily Receipt Obligation ("MDRO") plus any applicable Fuel Reimbursement Quantity, provided that, if more than one Customer requests receipts in excess of its MDRO at a Point of Receipt, and the sum of all such requests exceeds the available capacity at such Point of Receipt, Algonquin shall apportion such receipts in excess of MDRO among such Customers pro rata according to the Customers' firm MDROs at the relevant Point of Receipt.
- 2.2 Upon receipt of such natural gas for Customer's account, Algonquin shall, after making allowance for the Fuel Reimbursement Quantity, transport and deliver

hourly quantities of gas required by Customer up to Customer's Maximum Hourly Transportation Quantity ("MHTQ") at those points on Algonquin's system as are specified in an executed AFT-ES Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Delivery"); provided however, Algonquin shall not be obligated to, but may at its option, deliver at any Point(s) of Delivery an hourly quantity exceeding the MHTQ, and on any Day a quantity of gas in excess of the applicable Maximum Daily Delivery Obligation ("MDDO"), provided that, if more than one Customer requests deliveries in excess of its MDDO at a Point of Delivery, and the sum of all such requests exceeds the available capacity at such Point of Delivery, Algonquin shall apportion such deliveries in excess of MDDO among such Customers pro rata according to the Customers' firm MDDOs at the relevant Point of Delivery.

- 2.3 Provided such quantities have been scheduled in accordance with Section 23 of the General Terms and Conditions, Customer may tender quantities of gas in excess of the MDTQ plus any applicable Fuel Reimbursement Quantity on any Day if in Algonquin's reasonable judgment transportation of such gas can be accomplished by Algonquin without detriment to any other Customer under any of Algonquin's rate schedules. Such excess quantities shall be deemed to be Authorized Overrun Quantities.
- 2.4 A Customer executing a service agreement under this Rate Schedule AFT-ES has the right to make an election to convert its service in its entirety from firm transportation service under this rate schedule to firm transportation service under Rate Schedule AFT-E or Rate Schedule AFT-1 by providing written notice of such election on or before June 1 of any year. As part of such conversion, such converting Customer has the right to reduce its MDTQ to be applicable under Rate Schedule AFT-E or Rate Schedule AFT-1 upon such written notice of its election to convert. Such conversion and reduction shall be effective as of November 1 of that year.
- 2.5 Algonquin shall not be obligated to add any facilities or expand the capacity of Algonquin's pipeline system in any manner in order to provide transportation service to Customer pursuant to this rate schedule; provided, however, Algonquin may, at its option, and with Customer's consent, add facilities or expand capacity to provide such transportation service, subject to Section 42.
- 2.6 Subject to the conditions specified in Section 5 of this Rate Schedule, service hereunder shall encompass the right on the part of Customer to increase deliveries at the Point(s) of Delivery up to the MDTQ and to decrease deliveries at the Point(s) of Delivery without advance notice to Algonquin and without Customer's previously having provided for a concurrent increase or decrease in receipts at the Point(s) of Receipt.

- 2.7 Unless otherwise specified in the applicable service agreement, service hereunder shall be available on any day of the year, subject to Customer's MATQ and MDTQ limitations.
- 2.8 With respect to existing service agreements resulting from the conversion pursuant to Order No. 636 of sales and storage service under former Rate Schedules F-1, WS-1, STB and SS-3, subject to Algonquin's firm service obligations from primary points of receipt to primary points of delivery Algonquin shall provide service above Customer's MATQ up to but not in excess of the highest MDTQ on which Customer's Reservation Charge during the currently effective term of the service agreement is based, specified in the executed service agreement multiplied by 365 (366 for a leap year) and, on any Day, Algonquin shall provide service above Customer's current MDTQ for a given season up to but not in excess of the highest MDTQ on which Customer's Reservation Charge during the currently effective term of the service agreement is based; provided, however, that such additional quantities shall be provided with the same priority for purposes of scheduling accorded to service meeting the criteria of Section 48.3(a)(1) of the General Terms and Conditions of this tariff only to the extent these quantities are requested to be scheduled from a receipt point located within the Base Flow Path to a delivery point located within the Base Flow Path, and provided further, that for purposes of Curtailment Customer's maximum daily entitlement shall be the highest MDTQ specified in Customer's executed service agreement during the period of Curtailment. Such additional quantities shall be subject to fuel, the applicable commodity rate and any applicable commodity surcharges.

### 3. RATE

- 3.1 Unit Rates. The applicable maximum and minimum unit rates are set forth in the currently effective Statement of Rates for Rate Schedule AFT-ES of this tariff and are hereby incorporated herein. Such rates are subject to adjustment pursuant to Section 33 and Section 34 of the General Terms and Conditions of this tariff. The applicable unit rates to be charged on any Day by Algonquin for gas delivered to Customer shall not be in excess of the maximum unit rate nor less than the minimum unit rate.
- 3.2 Monthly Bill for Forwardhaul Rates. For Customers executing an AFT-ES Service Agreement for transportation which is not solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AFT-ES Service Agreement is effective and for each Month thereafter unless otherwise specified in the applicable Service Agreement, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:

- (a) Reservation Charge: The charge per Month per Dth of Customer's highest MDTQ during the Contract Year, as specified in Customer's executed AFT-ES Service Agreement; plus
- (b) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
- (c) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
- (d) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (e) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (f) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions; less
- (g) Revenue Credit: The revenue credit provided for in Section 41 of the General Terms and Conditions.

3.3 Monthly Bill for Backhaul Rates. For Customers executing an AFT-ES Service Agreement for transportation which is solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AFT-ES Service Agreement is effective and for each Month thereafter unless otherwise specified in the applicable Service Agreement, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:

- (a) Reservation Charge: The charge per Month per Dth of Customer's highest MDTQ during the Contract Year, as specified in the applicable Service Agreement; plus
- (b) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
- (c) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus

- (d) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (e) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (f) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions; less
- (g) Revenue Credit: The revenue credit provided for in Section 41 of the General Terms and Conditions.

#### 4. NOMINATIONS AND SCHEDULING OF RECEIPTS AND DELIVERIES

- 4.1 Nominations and Scheduling. If Customer desires transportation of natural gas on any Day under this rate schedule, Customer shall provide a nomination to Algonquin in accordance with Section 22 of the General Terms and Conditions of this tariff. Based upon the nomination of Customer, Algonquin shall schedule receipts and deliveries of gas in accordance with the General Terms and Conditions. It is the responsibility of Customer to adjust its deliveries and receipts to conform to the scheduled quantities.
- 4.2 Delivery of Gas. Based upon the daily quantity scheduled and in accordance with Section 5 herein, Algonquin shall make daily delivery of Customer's scheduled quantity taking into account the Fuel Reimbursement Quantity. It is the intention of Algonquin that daily deliveries of gas at the Point(s) of Delivery by Algonquin hereunder shall be as nearly equal as possible to daily receipts of gas at the Point(s) of Receipt by Algonquin for transportation hereunder, less the applicable Fuel Reimbursement Quantity. Any excess or deficiency in such receipts, less the applicable Fuel Reimbursement Quantity, and deliveries shall be resolved in accordance with the General Terms and Conditions of this tariff. Nothing in this rate schedule shall limit Algonquin's right to take actions pursuant to Section 26 of the General Terms and Conditions of this tariff.
- 4.3 No-Notice Service. Notwithstanding the quantities nominated by Customer and scheduled by Algonquin hereunder, Customer shall be entitled to increase its deliveries up to the MDDO at any point, up to the MHTQ during any Hour, and up to the MDTQ, or to decrease its deliveries. Provided that all of the operational conditions specified in Section 5 of this rate schedule (the "Section 5 Conditions") are met, Algonquin shall consent to such increase or decrease in deliveries, thereby nullifying any daily scheduling or hourly scheduling penalty that would otherwise be applicable pursuant to Section 23 of the General Terms and Conditions. Furthermore, if the Section 5 Conditions are met, Algonquin will forbear from taking action pursuant to Section 26 of the General Terms and

Conditions to reduce deliveries to Customer. If any of the Section 5 Conditions are not met, Algonquin shall not be required to receive or deliver gas in amounts other than the transportation quantities scheduled by Customer, and variations between scheduled quantities and actual deliveries to Customer's meter shall be subject to the assessment of penalties pursuant to Section 23 of the General Terms and Conditions.

- 4.4 Commingling of Gas. From the time the natural gas is received by Algonquin at the Point(s) of Receipt, Algonquin shall have the unqualified right to commingle such natural gas with other gas in Algonquin's system.

5. OTHER OPERATING CONDITIONS

Algonquin's obligation to provide service under this rate schedule is subject to the following conditions being satisfied:

- 5.1 Customer shall make all necessary arrangements, including the Upstream Arrangements, with other parties at or upstream of the Point(s) of Receipt where Customer tenders gas to Algonquin for transportation, and at or downstream of the Point(s) of Delivery where Algonquin delivers gas for Customer's account, and such arrangements must be compatible with Algonquin's system operations.
- 5.2 Algonquin shall schedule receipts at a Secondary Point of Receipt or deliveries at a Secondary Point of Delivery pursuant to the provisions of Sections 48.2 and 48.3 of the General Terms and Conditions.
- 5.3 To the extent that any Upstream Entity involved in handling Customer's gas refuses or is unable to deliver gas to Algonquin, Algonquin shall not be required to continue deliveries of gas on behalf of Customer. Prior to any reduction or interruption in service due to the failure of the Upstream Entity to deliver gas on behalf of Customer, Algonquin shall provide notice in a time and manner that is reasonable under then existing conditions. To the extent that any downstream entity involved in handling Customer's gas refuses or is unable to receive gas from Algonquin, Algonquin shall have the right to reduce deliveries of gas on behalf of Customer.
- 5.4 The Upstream Arrangements must be in full force and effect; Customer shall not be in default of the Upstream Arrangements; and Customer's rights under the Upstream Arrangements shall be enforceable by Customer or its agents without impairment due to curtailment, force majeure or other reasons.
- 5.5 The Upstream Entity(ies) shall recognize Algonquin's rights as Customer's agent to issue orders ("Section 5 Orders") on Customer's behalf nominating or directing for Customer's account no-notice service as encompassed within the Upstream Arrangements at such levels and at such times as Algonquin determines in its

reasonable discretion is required by the Algonquin system to meet the needs of Customer under this rate schedule.

- 5.6 All Upstream Entities involved in all Upstream Arrangements with Customer served under this rate schedule shall deliver to the various points of interconnection between Algonquin's facilities and the facilities of the various Upstream Entities such quantities of gas at such times as Algonquin determines in its reasonable discretion are required by the Algonquin system to meet the needs of Customer under this rate schedule.
- 5.7 Customer's Notice Agent must have complete authority to call upon supplies for Customer's account at such times, in such quantities, and at such locations as Algonquin deems necessary, in its reasonable discretion, to enable Algonquin to provide service as contemplated for Customer under this rate schedule.
- 5.8 All Notice Agents named by Customer under this rate schedule shall execute Section 5 Orders at such locations and at such times as Algonquin determines in its reasonable discretion are necessary to enable Algonquin to provide service as contemplated under Rate Schedules AFT-ES and AFT-E.
- 5.9 The daily quantities of natural gas transported shall be delivered at the Point(s) of Receipt at an hourly rate of 1/24th of the scheduled daily quantity. The daily quantities of natural gas transported shall be accepted at the Point(s) of Delivery at a substantially constant hourly rate or, in the case of service agreements resulting from the conversion pursuant to Order No. 636 of sales entitlements under former Rate Schedules F-1 and WS-1, at an hourly rate no greater than .06 multiplied by the scheduled daily quantity.
- 5.10 In the event Customer has multiple upstream no-notice services pursuant to more than one contract, from more than one pipeline, or under more than one rate schedule, Customer shall provide Algonquin a predetermined order of preference for these upstream services. Algonquin shall follow this order of preference in scheduling Customer's upstream no-notice service. Customer may, upon twenty-four hours' written notice to Algonquin, modify this specification of scheduling preferences.
- 5.11 In the event Algonquin issues a Section 5 Order on Customer's behalf, Algonquin shall provide notice as soon as possible to Customer and Customer's Notice Agent by telephone or facsimile and by posting on its Internet Web Site that the Section 5 Order has been issued.

## 6. POINT(S) OF RECEIPT AND DELIVERY

- 6.1 (A) Primary Points of Receipt: The Primary Point(s) of Receipt at which Algonquin shall receive gas for transportation under this rate schedule shall be specified in an exhibit to the service agreement executed by

Algonquin and Customer. Such exhibit shall specify for each Primary Point of Receipt the MDRO and receipt pressure obligations. Such exhibit by mutual written agreement may be superseded by a new exhibit which may add or delete specific points or make other changes thereto that the parties deem appropriate. Algonquin shall not accept any proposed Primary Point(s) of Receipt, or quantity at any Primary Point(s) of Receipt, or change in quantities among Primary Point(s) of Receipt if (a) the resulting aggregate MDROs at all of Customer's Primary Point(s) of Receipt would exceed Customer's MDTQ, or (b) in doing so, in Algonquin's reasonable judgment, Algonquin would impair its ability to satisfy its existing firm obligations to receive gas pursuant to other firm service agreements under which such Point(s) of Receipt are Primary Points of Receipt and to purchase and receive its Company Use Gas at maximum deliverability levels, as such Company Use Gas arrangements exist under agreements effective at the date of Customer's request or reasonably expected by Algonquin to be effective within six months of the request.

- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators for use as a Primary Point of Receipt in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Receipt to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In the event that Replacement Customer selects a new Primary Point of Receipt that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Receipt, shall revert to the Releasing Customer, and any Primary Points of Receipt granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.

- 6.2 Secondary Points of Receipt: Notwithstanding the foregoing, all interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt, with the exception of interconnections with the facilities of other operators accessible only through

the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline are available as Secondary Points of Receipt under this Rate Schedule AFT-ES. Such use of Secondary Points of Receipt is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.

- 6.3 (A) Primary Points of Delivery: The Primary Point(s) of Delivery at which Algonquin shall deliver gas for Customer's account under this rate schedule shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Primary Point of Delivery the MDDO and delivery pressure obligations. Algonquin shall not accept any proposed Primary Point(s) of Delivery, or quantity at any Point(s) of Delivery, or change in quantities among Primary Point(s) of Delivery if the resulting aggregate MDDOs at all of Customer's Primary Point(s) of Delivery would exceed Customer's MDTQ except to the extent Customer's MDDOs reflect the conversion of pre-existing entitlements under firm sales agreements.
- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators for use as a Primary Point of Delivery in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Delivery to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In the event that Replacement Customer selects a new Primary Point of Delivery that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon

termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Delivery, shall revert to the Releasing Customer, and any Primary Points of Delivery granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.

- 6.4 Secondary Points of Delivery: Notwithstanding the foregoing, all interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery, with the exception of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline are available as Secondary Points of Delivery under this Rate Schedule AFT-ES. Such use of Secondary Points of Delivery is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.

## 7. INDEMNIFICATION

- 7.1 Customer acknowledges that as a result of Section 5 Orders issued to Customer's Upstream Entity or Notice Agent hereunder, Customer may incur imbalances between receipts and deliveries that will be cashed out at Month's end pursuant to Section 25 of the General Terms and Conditions of this tariff. Algonquin shall provide Customer with notice of an imbalance in a timely manner. Customer shall hold Algonquin harmless and indemnify Algonquin against any claim by Customer or otherwise arising out of the incurrence of imbalances as a result of Algonquin's issuance of Section 5 Orders.
- 7.2 Customer acknowledges that the exercise by Algonquin of its agency authority with respect to the Upstream Arrangements may cause the Upstream Entity to assess imbalance cash-out charges and transportation usage, storage injection, storage withdrawal or other charges against Customer. Customer shall hold Algonquin harmless and indemnify Algonquin against any liability whatsoever from any party whatsoever as a result of Algonquin's exercise of its agency authority with respect to the Upstream Arrangements hereunder.

- 7.3 Customer acknowledges that Notice Agent's execution of Section 5 Orders may cause upstream transporters or suppliers to assess charges against Customer for gas costs, transportation services, storage services, imbalance cash out or otherwise. Customer shall hold Algonquin harmless and indemnify Algonquin against any liability whatsoever from any party whatsoever as a result of Algonquin's issuance of Section 5 Orders to the Notice Agent, and the Notice Agent's performance or non-performance of its duties.
- 7.4 Notwithstanding the other provisions of this Section 7, Algonquin is not absolved from liability arising as a result of negligence on the part of Algonquin.

8. GENERAL TERMS AND CONDITIONS

The applicable General Terms and Conditions of this FERC Gas Tariff are hereby made a part of this rate schedule.

**RATE SCHEDULE AFT-CL**  
**FIRM TRANSPORTATION SERVICE**

1. **AVAILABILITY**

This rate schedule is available for firm transportation of natural gas by Algonquin Gas Transmission, LLC (hereinafter called "Algonquin") for any party (hereinafter called "Customer") on that portion of Algonquin's pipeline system known as (1) the Canal Lateral, which shall mean pipeline facilities including pipeline lateral facilities, meter station, and appurtenant facilities which extend from a point on Algonquin's existing mainline interstate natural gas pipeline system in Bourne, Massachusetts, along the north side of the Cape Cod Canal, under the Cape Cod Canal at or near the Bourne/Sandwich town line, and terminating at a point in the town of Sandwich in Barnstable County, Massachusetts, (2) the Middletown Lateral, which shall mean pipeline facilities including a pipeline lateral, meter station, and appurtenant facilities which will extend from a point on Algonquin's existing interstate natural gas pipeline system in Glastonbury, Connecticut to a point of interconnection, at the outlet side of the Middletown Meter Station, with facilities constructed by Connecticut Light and Power Company, (3) the Cleary Lateral, which shall mean pipeline facilities including a pipeline lateral, meter station, and appurtenant facilities which will extend from a point on Algonquin's existing interstate natural gas pipeline system in Berkley, Massachusetts, under the Taunton River to a point of interconnection, at the outlet side of the Cleary Meter Station, with facilities constructed by Taunton Municipal Lighting Plant, (4) the Lake Road Lateral, which shall mean pipeline facilities including a pipeline lateral, meter station, and appurtenant facilities which will extend from a point on Algonquin's existing interstate natural gas pipeline system in Windham County, Connecticut to a point of interconnection, at the outlet side of the Lake Road Meter Station, with facilities constructed by Lake Road Generating Co. LP, (5) the Brayton Point Lateral, which shall mean pipeline facilities including a pipeline lateral, meter station, and appurtenant facilities which will extend from a point on Algonquin's existing interstate natural gas pipeline system in Dighton, MA (M&R No. 80034) to a point of interconnection, at the outlet side of the Brayton Point Meter Station, with facilities owned by US Gen New England, Inc. (M&R No. 00090), (6) the Bellingham Lateral, which shall mean pipeline facilities including a pipeline lateral, meter station and appurtenant facilities which will extend from a point on Algonquin's existing interstate natural gas pipeline system in Norfolk County, Massachusetts to a point of interconnection, at the outlet side of the Bellingham Meter Station, with facilities constructed by ANP Bellingham Energy Company, (7) the Phelps Dodge Lateral, which shall mean pipeline facilities including a pipeline lateral, meter station and appurtenant facilities which will extend from a point on Algonquin's existing interstate natural gas pipeline system in New London County, Connecticut to a point of interconnection at the outlet side of the Phelps Dodge Meter Station, with facilities owned by Phelps Dodge Copper Products Company, (8) the Manchester Street Lateral, which shall mean pipeline facilities including a pipeline lateral, meter station and appurtenant facilities that extend from a point on Algonquin's existing interstate natural gas pipeline system at the head of the G-12 Lateral (M&R No. 80070) to a point of interconnection with facilities owned by USGen New England, Inc.

at the outlet side of the Manchester Street power plant (M&R No. 00087), (9) the Cape Cod Lateral, which shall mean pipeline facilities including a pipeline lateral, meter station and appurtenant facilities that extend from the terminus of Algonquin's Canal Lateral in the town of Sandwich in Barnstable County, Massachusetts, to a point of interconnection with facilities owned by Colonial Gas Company d/b/a KeySpan Energy Delivery New England in the town of Sandwich in Barnstable County, Massachusetts, (10) the Northeast Gateway Lateral, which shall mean pipeline facilities including a pipeline lateral and appurtenant facilities that extend from a point on Algonquin's existing HubLine offshore system in Massachusetts Bay, Massachusetts, to a point of interconnection with the offshore deepwater port facilities owned by Northeast Gateway Energy Bridge, L.L.C., (11) the J-2 Facility, which shall mean pipeline facilities including two parallel pipeline laterals, meter stations and appurtenant facilities that extend from a point on Algonquin's existing interstate natural gas pipeline system at the head of the J-2 Facility (M&R No. 80094) to a point of interconnection with facilities owned by The Boston Gas Company d/b/a National Grid downstream of the Mansfield Street Station (M&R No. 00070), (12) the Kleen Energy Lateral, which shall mean pipeline facilities including a pipeline lateral, meter station and appurtenant facilities that extend from a point on Algonquin's existing Middletown Lateral in the City of Middletown, Connecticut, to a point of interconnection, at the outlet side of the Kleen Energy Meter Station (M&R No. 00833), with the Kleen Energy Power Plant facilities, or (13) the West Roxbury Lateral, which shall mean pipeline facilities including pipeline lateral facilities, meter station, and appurtenant facilities that extend from a point on Algonquin's existing mainline interstate natural gas pipeline system at the head of the West Roxbury Lateral (M&R No. 80104) in the Town of Westwood in Norfolk County, Massachusetts, to a point of interconnection, at the outlet side of the West Roxbury Meter Station, with facilities owned by the Boston Gas Company d/b/a National Grid (M&R No. 00838) when:

- a. Algonquin has placed the Canal Lateral, Middletown Lateral, Cleary Lateral, Lake Road Lateral, Brayton Point Lateral, Bellingham Lateral, Phelps Dodge Lateral, Manchester Street Lateral, Cape Cod Lateral, Northeast Gateway Lateral, J-2 Facility, Kleen Energy Lateral, or West Roxbury Lateral, as applicable, in service;
- b. Customer has made a valid request for firm transportation pursuant to Section 2 of the General Terms and Conditions of this FERC Gas Tariff of which this rate schedule is a part;
- c. Sufficient firm capacity is available to effectuate such transportation without any construction of facilities or other investment by Algonquin, or Algonquin has waived this requirement in writing;
- d. The Primary Point(s) of Receipt and Primary Point(s) of Delivery requested by Customer are acceptable to Algonquin from the viewpoint of adequacy of Algonquin's existing facilities to receive and transport Customer's gas with Algonquin's existing firm service taking precedence; and

- e. Customer has executed a service agreement in the form contained in the FERC Gas Tariff of which this rate schedule is a part.

## 2. APPLICABILITY AND CHARACTER OF SERVICE

- 2.1 Transportation service hereunder will be on a firm basis except as provided herein and in Sections 16 and 24 of the General Terms and Conditions of this tariff. Algonquin shall receive from Customer, or for the account of Customer, at those points on Algonquin's system as specified in an executed AFT-CL Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Receipt") for transportation hereunder daily quantities of gas tendered for account of Customer up to Customer's Maximum Daily Transportation Quantity the ("MDTQ") and, on a cumulative basis in any year, up to Customer's Maximum Annual Transportation Quantity ("MATQ") as specified in the service agreement; provided, however, Algonquin shall not be obligated to, but may at its option, receive at any Point(s) of Receipt on any Day a quantity of gas in excess of the applicable Maximum Daily Receipt Obligation ("MDRO"), provided that, if more than one Customer requests receipts in excess of its MDRO at a Point of Receipt, and the sum of all such requests exceeds the available capacity at such Point of Receipt, Algonquin shall apportion such receipts in excess of MDRO among such Customers pro rata according to the Customers' firm MDROs at the relevant Point of Receipt.
- 2.2 Upon receipt of such natural gas for Customer's account, Algonquin shall transport and deliver hourly quantities of gas required by Customer up to Customer's MDTQ and, on a cumulative basis in any year, up to Customer's MATQ at those points on Algonquin's system as are specified in an executed AFT-CL Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Delivery"); provided, however, Algonquin shall not be obligated to, but may at its option, deliver at any Point(s) of Delivery a daily quantity exceeding the applicable Maximum Daily Delivery Obligation ("MDDO"), provided that, if more than one Customer requests deliveries in excess of its MDDO at a Point of Delivery, and the sum of all such requests exceeds the available capacity at such Point of Delivery, Algonquin shall apportion such deliveries in excess of MDDO among such Customers pro rata according to the Customers' firm MDDOs at the relevant Point of Delivery.
- 2.3 Provided such quantities have been scheduled in accordance with Section 23 of the General Terms and Conditions, Customer may tender quantities of gas in excess of the MDTQ on any Day if in Algonquin's reasonable judgment transportation of such gas can be accomplished by Algonquin without detriment to any other Customer under any of Algonquin's rate schedules. Such excess quantities shall be deemed to be Authorized Overrun Quantities.

- 2.4 Algonquin shall not be obligated to add any facilities or expand the capacity of Algonquin's pipeline system in any manner in order to provide transportation service to Customer pursuant to this rate schedule; provided, however, Algonquin may, at its option, and with Customer's consent, add facilities or expand capacity to provide such transportation service, subject to Section 3 below.
- 2.5 Unless otherwise specified in the applicable Service Agreement, services hereunder shall be available on any day of the year, subject to Customer's MATQ and MDTQ limitations.

3. RATE

- 3.1 Unit Rates. The applicable maximum and minimum unit rates are set forth in the currently effective Statement of Rates for Rate Schedule AFT-CL of this tariff and are hereby incorporated herein. Such rates are subject to change under Sections 33 and 34 of the General Terms & Conditions as well as subject to the provisions of Section 4.3 of this rate schedule. The applicable unit rates to be charged on any Day by Algonquin for gas delivered to Customer shall not be in excess of the maximum unit rate nor less than the minimum unit rate.
- 3.2 Monthly Bill. Commencing for the Month in which the AFT-CL Service Agreement is effective, and for each Month thereafter unless otherwise specified in the applicable Service Agreement, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:
- (a) Reservation Charge: The charge per Month per Dth of Customer's MDTQ as specified in Customer's executed AFT-CL Service Agreement; plus
  - (b) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
  - (c) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
  - (d) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
  - (e) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
  - (f) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions; less

- (g) Revenue Credit: The revenue credit provided for in Section 41 of the General Terms and Conditions.

3.3 Customer Reimbursement. Customer shall, in addition to the charges referenced above, reimburse Algonquin for the following:

- (a) The costs of any facilities installed by Algonquin with Customer's consent to receive, measure, transport or deliver natural gas for the account of Customer; and
- (b) Any and all filing and approval fees required in connection with Customer's service agreement that Algonquin is obligated to pay to the FERC or any other governmental authority having jurisdiction.

Any reimbursement due Algonquin by Customer pursuant to this Section 3.3 shall be due and payable to Algonquin within ten days of the date of Algonquin's invoice(s) for same.

4. NOMINATIONS AND SCHEDULING OF RECEIPTS AND DELIVERIES

- 4.1 Nominations and Scheduling. If Customer desires transportation of natural gas on any Day under this rate schedule, Customer shall provide a nomination to Algonquin in accordance with Section 22 of the General Terms and Conditions of this tariff. Based upon the nomination of Customer, Algonquin shall schedule receipts and deliveries of gas in accordance with the General Terms and Conditions. It is the responsibility of Customer to adjust its deliveries and receipts to conform to the scheduled quantities.
- 4.2 Delivery of Gas. Based upon the daily quantity scheduled, Algonquin shall make daily delivery of Customer's scheduled quantity. It is the intention of Algonquin that daily deliveries of gas at the Point(s) of Delivery by Algonquin hereunder shall be as nearly equal as possible to daily receipts of gas at the Point(s) of Receipt by Algonquin for transportation hereunder. Any excess or deficiency in such receipts and deliveries shall be resolved in accordance with the General Terms and Conditions of this tariff. Nothing in this rate schedule shall limit Algonquin's right to take actions pursuant to Section 26 of the General Terms and Conditions of this tariff.
- 4.3 Responsibility for Imbalances. Any imbalance resulting from transportation pursuant to this rate schedule on the Canal Lateral, Middletown Lateral, Cleary Lateral, Lake Road Lateral, Brayton Point Lateral, Bellingham Lateral, Phelps Dodge Lateral, Manchester Street Lateral, Cape Cod Lateral, Northeast Gateway Lateral, J-2 Facility, Kleen Energy Lateral, or West Roxbury Lateral, as applicable, shall be accounted for under the upstream transportation agreement(s) pursuant to which such gas was delivered to the inlet of the Canal Lateral,

Middletown Lateral, Cleary Lateral, Lake Road Lateral, Brayton Point Lateral, Bellingham Lateral, Phelps Dodge Lateral, Manchester Street Lateral, Cape Cod Lateral, Northeast Gateway Lateral, J-2 Facility, Kleen Energy Lateral, or West Roxbury Lateral, as applicable. No imbalance resolution charges, unauthorized overrun penalties, or scheduling penalties shall be assessed under this rate schedule to the extent that Algonquin has assessed any such charges or penalties under another agreement with respect to the same gas or transaction.

- 4.4 Commingling of Gas. From the time the natural gas is received by Algonquin at the Point(s) of Receipt, Algonquin shall have the unqualified right to commingle such natural gas with other gas in Algonquin's system.

5. OTHER OPERATING CONDITIONS

Algonquin's obligation to provide service under this rate schedule is subject to the following conditions being satisfied:

- 5.1 Customer shall make all necessary arrangements with other parties at or upstream of the Point(s) of Receipt where Customer tenders gas to Algonquin for transportation, and at or downstream of the Point(s) of Delivery where Algonquin delivers gas for Customer's account, and such arrangements must be compatible with Algonquin's system operations.
- 5.2 Algonquin shall schedule receipts at a Secondary Point of Receipt or deliveries at a Secondary Point of Delivery pursuant to the provisions of Sections 48.2 and 48.3 of the General Terms and Conditions.
- 5.3 To the extent that any upstream entity involved in handling Customer's gas (other than Algonquin) refuses or is unable to deliver gas to Algonquin, Algonquin shall not be required to continue deliveries of gas on behalf of Customer. Prior to any reduction or interruption in service due to the failure of the upstream entity to deliver gas on behalf of Customer, Algonquin shall provide notice in a time and manner that is reasonable under then existing conditions. To the extent that any downstream entity involved in handling Customer's gas refuses or is unable to receive gas from Algonquin, Algonquin shall have the right to reduce deliveries of gas on behalf of Customer.

6. POINT(S) OF RECEIPT AND DELIVERY

- 6.1 (A) Primary Points of Receipt: The Primary Point(s) of Receipt at which Algonquin shall receive gas for transportation under this rate schedule shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Primary Point of Receipt the MDRO and receipt pressure obligations. Such exhibit by mutual written agreement may be superseded by a new exhibit which may add or delete specific points or make other changes thereto that the

parties deem appropriate. Algonquin shall not accept any proposed Primary Point(s) of Receipt, or quantity at any Primary Point(s) of Receipt, or change in quantities among Primary Point(s) of Receipt if (a) the resulting aggregate MDROs at all of Customer's Primary Point(s) of Receipt would exceed Customer's MDTQ, or (b) in doing so, in Algonquin's reasonable judgment, Algonquin would impair its ability to satisfy its existing firm obligations to receive gas pursuant to other firm service agreements under which such Point(s) of Receipt are Primary Points of Receipt and to purchase and receive its Company Use Gas at maximum deliverability levels, as such Company Use Gas arrangements exist under agreements effective at the date of Customer's request or reasonably expected by Algonquin to be effective within six months of the request.

- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators on the designated AFT-CL lateral for use as a Primary Point of Receipt in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Receipt to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment to the Primary Points of Receipt under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In addition, a Replacement Customer may choose only those primary points along the lateral segment on which it contracts for transportation service under the replacement contract, as those lateral segments are set forth in the description of Secondary Points in Section 6.2 below. In the event that Replacement Customer selects a new Primary Point of Receipt that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Receipt, shall revert to the Releasing Customer, and any Primary Points of Receipt granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.

- 6.2 Secondary Points of Receipt: Notwithstanding the foregoing, all interconnections between the Canal Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt

for service on the Canal Lateral, all interconnections between the Middletown Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the Middletown Lateral, all interconnections between the Cleary Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the Cleary Lateral, all interconnections between the Lake Road Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the Lake Road Lateral, all interconnections between the Brayton Point Lateral facilities of Algonquin and the facilities of other operators including, but not limited to, the tap on the Algonquin G-1 System in Dighton, MA (M&R No. 80034) shall be available for use by Customer as Secondary Points of Receipt for service on the Brayton Point Lateral, all interconnections between the Bellingham Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the Bellingham Lateral, all interconnections between the Phelps Dodge Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the Phelps Dodge Lateral, all interconnections between the Manchester Street Lateral facilities of Algonquin and the facilities of other operators, including, but not limited to, the head of the G-12 Lateral (M&R No. 80070), shall be available for use by Customer as Secondary Points of Receipt for service on the Manchester Street Lateral, all interconnections between the Cape Cod Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the Cape Cod Lateral, all interconnections between the Northeast Gateway Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the Northeast Gateway Lateral, all interconnections between the J-2 Facility of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the J-2 Facility, all interconnections between the Kleen Energy Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the Kleen Energy Lateral, and all interconnections between the West Roxbury Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the West Roxbury Lateral. Such use of Secondary Points of Receipt is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.

- 6.3 (A) Primary Points of Delivery: The Primary Point(s) of Delivery at which Algonquin shall deliver gas for Customer's account under this rate schedule shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Point of Delivery the MDDO and delivery pressure obligations. Algonquin shall not accept any proposed Primary Point(s) of Delivery, or quantity at any

Primary Point(s) of Delivery, or change in quantities among Primary Point(s) of Delivery if the resulting aggregate Primary Point(s) of Delivery if the resulting aggregate MDDOs at all of Customer's Primary Point(s) of Delivery would exceed Customer's MDTQ except to the extent Customer's MDDOs reflect the conversion of pre-existing entitlements under firm sales agreements.

- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators on the designated AFT-CL lateral for use as a Primary Point of Delivery in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Delivery to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment to the Primary Points of Delivery under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In addition, a Replacement Customer may choose only those primary points along the lateral segment on which it contracts for transportation service under the replacement contract, as those lateral segments are set forth in the description of Secondary Points in Section 6.4 below. In the event that Replacement Customer selects a new Primary Point of Delivery that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Delivery, shall revert to the Releasing Customer, and any Primary Points of Delivery granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.

- 6.4 Secondary Points of Delivery: Notwithstanding the foregoing, all interconnections between the Canal Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the Canal Lateral, all interconnections between the Middletown facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the Middletown Lateral, all interconnections between the Cleary Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the Cleary Lateral, all interconnections between the Lake Road Lateral facilities of Algonquin and the

facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the Lake Road Lateral, all interconnections between the Brayton Point Lateral facilities of Algonquin and the facilities of other operators including, but not limited to, the tap on the Algonquin G-1 System in Dighton, MA (M&R 80034) shall be available for use by Customer as Secondary Points of Delivery for service on the Brayton Point Lateral, all interconnections between the Bellingham Lateral facilities of Algonquin and facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the Bellingham Lateral, all interconnections between the Phelps Dodge Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the Phelps Dodge Lateral, all interconnections between the Manchester Street Lateral facilities of Algonquin and the facilities of other operators, including, but not limited to, the head of the G-12 Lateral (M&R No. 80070), shall be available for use by Customer as Secondary Points of Delivery for service on the Manchester Street Lateral, all interconnections between the Cape Cod Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the Cape Cod Lateral, all interconnections between the Northeast Gateway Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the Northeast Gateway Lateral, all interconnections between the J-2 Facility of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the J-2 Facility, all interconnections between the Kleen Energy Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the Kleen Energy Lateral, and all interconnections between the West Roxbury Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the West Roxbury Lateral. Such use of Secondary Points of Delivery is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.

7. GENERAL TERMS AND CONDITIONS

The applicable General Terms and Conditions of this FERC Gas Tariff are hereby made a part of this rate schedule.

**RATE SCHEDULE AIT-1**  
**INTERRUPTIBLE TRANSPORTATION SERVICE**

1. **AVAILABILITY**

This rate schedule is available for interruptible transportation of natural gas by Algonquin Gas Transmission, LLC (hereinafter called "Algonquin") for any party (hereinafter called "Customer"), when:

- a. Customer has made a valid request for interruptible transportation pursuant to Section 2 of the General Terms and Conditions of this FERC Gas Tariff of which this rate schedule is a part; and
- b. Customer has executed a service agreement in the form contained in the FERC Gas Tariff of which this rate schedule is a part.
- c. Transportation service effectuated through capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL is not available under this rate schedule; provided, however that the interconnection between the Brayton Point Lateral and Algonquin's mainline (M&R No. 80035), the interconnection between the Manchester Street Lateral and Algonquin's mainline (M&R No. 80071), the interconnection between the Canal Lateral and Algonquin's mainline (M&R No. 8004), the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline (M&R No. 80095), the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline (M&R No. 80104) are available under this Rate Schedule AIT-1.

2. **APPLICABILITY AND CHARACTER OF SERVICE**

- 2.1 Transportation service hereunder will be on an interruptible basis. Algonquin shall receive from Customer, or for the account of Customer, at those points on Algonquin's system as specified in an executed AIT-1 Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Receipt") for transportation hereunder daily quantities of gas tendered for the account of Customer up to Customer's Maximum Daily Transportation Quantity ("MDTQ") plus an amount reflecting the Fuel Reimbursement Quantity as defined in Section 32 of the General Terms and Conditions of this tariff and, on a cumulative basis in any year, up to Customer's Maximum Annual Transportation Quantity ("MATQ") as specified in the service agreement plus amounts reflecting the Fuel Reimbursement Quantity.

- 2.2 Upon receipt of such natural gas for Customer's account, Algonquin shall, after making allowance for the Fuel Reimbursement Quantity, transport and deliver hourly quantities of gas required by Customer up to Customer's Maximum Hourly Transportation Quantity ("MHTQ") at those points on Algonquin's system as are specified in an executed AIT-1 Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Delivery"), provided, however, Algonquin shall not be obligated to, but may at its option, deliver at any Point(s) of Delivery an hourly quantity exceeding the MHTQ.
- 2.3 Provided such quantities have been scheduled in accordance with Section 23 of the General Terms and Conditions, Customer may tender quantities of gas in excess of the MDTQ plus any applicable Fuel Reimbursement Quantity on any Day if in Algonquin's reasonable judgment transportation of such gas can be accomplished by Algonquin without detriment to any other Customer under any of Algonquin's rate schedules. Such excess quantities shall be deemed to be Authorized Overrun Quantities.
- 2.4 Algonquin shall not be obligated to add any facilities or expand the capacity of Algonquin's pipeline system in any manner in order to provide transportation service to Customer pursuant to this rate schedule; provided, however, Algonquin may, at its option, and with Customer's consent, add facilities or expand capacity to provide such transportation service, subject to Section 42.

### 3. RATE

- 3.1 Unit Rates. The applicable maximum and minimum unit rates are set forth in the currently effective Statement of Rates for Rate Schedule AIT-1 of this FERC Gas Tariff and are hereby incorporated herein. Such rates are subject to adjustment pursuant to Section 33 and Section 34 of the General Terms and Conditions of this tariff. The applicable unit rates to be charged on any Day by Algonquin for gas delivered to Customer shall not be in excess of the maximum unit rate nor less than the minimum unit rate.
- 3.2 Monthly Bill for Forwardhaul Rates. For Customers executing an AIT-1 Service Agreement for transportation which is not solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AIT-I Service Agreement is effective and for each Month thereafter, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:
- (a) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus

- (b) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
- (c) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (d) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (e) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions.

3.3 Monthly Bill for Backhaul Rates. For Customers executing an AIT-1 Service Agreement for transportation which is solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AIT-1 Service Agreement is effective and for each Month thereafter, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:

- (a) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
- (b) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
- (c) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (d) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (e) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions.

#### 4. NOMINATIONS AND SCHEDULING OF RECEIPTS AND DELIVERIES

4.1 Nominations and Scheduling. If Customer desires transportation of natural gas on any Day under this rate schedule, Customer shall provide a nomination to Algonquin in accordance with Section 22 of the General Terms and Conditions of

this tariff. Based upon the nomination of Customer, Algonquin shall schedule receipts and deliveries of gas in accordance with the General Terms and Conditions. It is the responsibility of Customer to adjust its deliveries and receipts to conform to the scheduled quantities.

- 4.2 Delivery of Gas. Based upon the daily quantity scheduled, Algonquin shall make daily delivery of Customer's scheduled quantity taking into account the Fuel Reimbursement Quantity. It is the intention of Algonquin that daily deliveries of gas at the Point(s) of Delivery by Algonquin hereunder shall be as nearly equal as possible to daily receipts of gas at the Point(s) of Receipt by Algonquin for transportation hereunder, less the applicable Fuel Reimbursement Quantity. Any excess or deficiency in such receipts, less the applicable Fuel Reimbursement Quantity, and deliveries shall be resolved in accordance with the General Terms and Conditions. Nothing in this rate schedule shall limit Algonquin's right to take actions pursuant to Section 26 of the General Terms and Conditions of this tariff.
- 4.3 Commingling of Gas. From the time the natural gas is received by Algonquin at the Point(s) of Receipt, Algonquin shall have the unqualified right to commingle such natural gas with other gas in Algonquin's system.

5. OTHER OPERATING CONDITIONS

Algonquin's obligation to provide service under this rate schedule is subject to the following conditions being satisfied:

- 5.1 Customer shall make all necessary arrangements with other parties at or upstream of the Point(s) of Receipt where Customer tenders gas to Algonquin for transportation, and at or downstream of the Point(s) of Delivery where Algonquin delivers gas for Customer's account, and such arrangements must be compatible with Algonquin's system operations.
- 5.2 To the extent that any upstream entity involved in handling Customer's gas refuses or is unable to deliver gas to Algonquin, Algonquin shall not be required to continue deliveries of gas on behalf of Customer. To the extent that any downstream entity involved in handling Customer's gas refuses or is unable to receive gas from Algonquin, Algonquin shall have the right to reduce deliveries of gas on behalf of Customer.
- 5.3 The daily quantities of natural gas transported shall be delivered at the Point(s) of Receipt and accepted at the Point(s) of Delivery at a substantially constant hourly rate, or such other hourly rate as may be acceptable to Algonquin.

6. POINT(S) OF RECEIPT AND DELIVERY

- 6.1 All interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Point(s) of Receipt, with the

exception of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline are available as Points of Receipt under this Rate Schedule AIT-1.

- 6.2 All interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Point(s) of Delivery, with the exception of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline are available as Points of Delivery under this Rate Schedule AIT-1.

## 7. GENERAL TERMS AND CONDITIONS

The applicable General Terms and Conditions of this FERC Gas Tariff are hereby made a part of this rate schedule.

**RATE SCHEDULE AIT-2**  
**INTERRUPTIBLE TRANSPORTATION SERVICE**

1. **AVAILABILITY**

This rate schedule is available for interruptible transportation of natural gas by Algonquin Gas Transmission, LLC (hereinafter called "Algonquin") for any party (hereinafter called "Customer") on the Brayton Point Lateral, on the Manchester Street Lateral, on the Canal Lateral, on the Cape Cod Lateral, on the Northeast Gateway Lateral, on the J-2 Facility, on the Kleen Energy Lateral, or on the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL, when:

- a. Customer has made a valid request for interruptible transportation pursuant to Section 2 of the General Terms and Conditions of this FERC Gas Tariff of which this rate schedule is a part; and
- b. Customer has executed a service agreement in the form contained in the FERC Gas Tariff of which this rate schedule is a part; and
- c. Customer's service agreement specifies that either the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL, shall be utilized to effectuate service hereunder.

2. **APPLICABILITY AND CHARACTER OF SERVICE**

- 2.1 Transportation service hereunder will be on an interruptible basis. Algonquin shall receive from Customer, or for the account of Customer, at those points on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral, as specified in Customer's executed AIT-2 Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Receipt") for transportation hereunder daily quantities of gas tendered for the account of Customer up to Customer's Maximum Daily Transportation Quantity ("MDTQ") plus an amount reflecting the Fuel Reimbursement Quantity, if applicable, as defined in Section 32 of the General Terms and Conditions of this tariff and, on a cumulative basis in any year, up to Customer's Maximum Annual Transportation Quantity ("MATQ") as specified in the service agreement plus amounts reflecting the Fuel Reimbursement Quantity, if applicable.
- 2.2 Upon receipt of such natural gas for Customer's account, Algonquin shall, after making allowance for the Fuel Reimbursement Quantity, if applicable, transport and deliver hourly quantities of gas required by Customer up to Customer's Maximum Hourly Transportation Quantity ("MHTQ") at those points on the

Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral, as specified in Customer's executed AIT-2 Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Delivery"), provided, however, Algonquin shall not be obligated to, but may at its option, deliver at any Point(s) of Delivery an hourly quantity exceeding the MHTQ.

- 2.3 Provided such quantities have been scheduled in accordance with Section 23 of the General Terms and Conditions, Customer may tender quantities of gas in excess of the MDTQ plus any applicable Fuel Reimbursement Quantity on any Day if in Algonquin's reasonable judgment transportation of such gas can be accomplished by Algonquin without detriment to any other Customer under any of Algonquin's rate schedules. Such excess quantities shall be deemed to be Authorized Overrun Quantities.
- 2.4 Algonquin shall not be obligated to add any facilities or expand the capacity of Algonquin's pipeline system in any manner in order to provide transportation service to Customer pursuant to this rate schedule; provided, however, Algonquin may, at its option, and with Customer's consent, add facilities or expand capacity to provide such transportation service, subject to Section 42 of the General Terms and Conditions of this tariff.

### 3. RATE

- 3.1 Unit Rates. The applicable maximum and minimum unit rates are set forth in the currently effective Statement of Rates for Rate Schedule AIT-2 of this FERC Gas Tariff and are hereby incorporated herein. Such rates are subject to adjustment pursuant to Section 33 and Section 34 of the General Terms and Conditions of this tariff. The applicable unit rates to be charged on any Day by Algonquin for gas delivered to Customer shall not be in excess of the maximum unit rate nor less than the minimum unit rate, except as provided in Section 46 of the General Terms and Conditions of Algonquin's FERC Gas Tariff.
- 3.2 Monthly Bill. Commencing for the Month in which the AIT-2 Service Agreement is effective and for each Month thereafter, Algonquin shall charge Customer and Customer shall pay Algonquin the sum of the following amounts:
- (a) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
  - (b) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus

- (c) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (d) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (e) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions.

#### 4. NOMINATIONS AND SCHEDULING OF RECEIPTS AND DELIVERIES

- 4.1 Nominations and Scheduling. If Customer desires transportation of natural gas on any Day under this rate schedule, Customer shall provide a nomination to Algonquin in accordance with Section 22 of the General Terms and Conditions of this tariff. Based upon the nomination of Customer, Algonquin shall schedule receipts and deliveries of gas in accordance with the General Terms and Conditions. It is the responsibility of Customer to adjust its deliveries and receipts to conform to the scheduled quantities.
- 4.2 Delivery of Gas. Based upon the daily quantity scheduled, Algonquin shall make daily delivery of Customer's scheduled quantity taking into account the Fuel Reimbursement Quantity. It is the intention of Algonquin that daily deliveries of gas at the Point(s) of Delivery by Algonquin hereunder shall be as nearly equal as possible to daily receipts of gas at the Point(s) of Receipt by Algonquin for transportation hereunder, less the applicable Fuel Reimbursement Quantity. Any excess or deficiency in such receipts, less the applicable Fuel Reimbursement Quantity, and deliveries shall be resolved in accordance with the General Terms and Conditions. Nothing in this rate schedule shall limit Algonquin's right to take actions pursuant to Section 26 of the General Terms and Conditions of this tariff.
- 4.3 Responsibility for Imbalances. Any imbalance resulting from transportation transactions pursuant to this rate schedule on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral, as specified on Customer's AIT-2 Service Agreement for which natural gas was received under an upstream transportation agreement(s) on Algonquin's system shall be accounted for under the upstream transportation agreement(s). No imbalance resolution charges, unauthorized overrun penalties, or scheduling penalties shall be assessed under this rate schedule for such transactions to the extent that Algonquin has assessed any such charges or penalties under the upstream transportation agreement(s) with respect to the same gas or transactions.

- 4.4 Commingling of Gas. From the time the natural gas is received by Algonquin at the Point(s) of Receipt, Algonquin shall have the unqualified right to commingle such natural gas with other gas in Algonquin's system.

5. OTHER OPERATING CONDITIONS

Algonquin's obligation to provide service under this rate schedule is subject to the following conditions being satisfied:

- 5.1 Customer shall make all necessary arrangements with Algonquin or other parties, as applicable, at or upstream of the Point(s) of Receipt where Customer tenders gas to Algonquin for transportation, and at or downstream of the Point(s) of Delivery where Algonquin delivers gas for Customer's account, and such arrangements must be compatible with Algonquin's system operations.
- 5.2 To the extent that any upstream entity involved in handling Customer's gas refuses or is unable to deliver gas to Algonquin, Algonquin shall not be required to continue deliveries of gas on behalf of Customer. To the extent that any downstream entity involved in handling Customer's gas refuses or is unable to receive gas from Algonquin, Algonquin shall have the right to reduce deliveries of gas on behalf of Customer.
- 5.3 The daily quantities of natural gas transported shall be delivered at the Point(s) of Receipt and accepted at the Point(s) of Delivery at a substantially constant hourly rate, or such other hourly rate as may be acceptable to Algonquin.

6. POINT(S) OF RECEIPT AND DELIVERY

- 6.1 All interconnections between the Brayton Point Lateral facilities, including, but not limited to, the tap on Algonquin's G-1 System in Dighton, MA (M&R No. 80034); the Manchester Street Lateral facilities, including, but not limited to the head of the G-12 Lateral (M&R No. 80070); the Canal Lateral facilities, including, but not limited to, the interconnection between the Canal Lateral and Algonquin's mainline; the Cape Cod Lateral facilities, including, but not limited to, the interconnection between the Cape Cod Lateral and the Canal Lateral; the Northeast Gateway Lateral facilities, including, but not limited to, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts; the J-2 Facility, including, but not limited to the head of the J-2 Facility (M&R No. 80094); the Kleen Energy Lateral facilities, including, but not limited to, the interconnection between the Kleen Energy Lateral and the Middletown Lateral; or the West Roxbury Lateral facilities, including, but not limited to, the interconnection between the West Roxbury Lateral and Algonquin's mainline, as specified in Customer's executed AIT-2 Service Agreement, and the facilities of other operators shall be available for use by Customer as Point(s) of Receipt.

- 6.2 All interconnections between the Brayton Point Lateral facilities, including, but not limited to, the tap on Algonquin's G-1 System in Dighton, MA (M&R No. 80034); the Manchester Street Lateral facilities, including, but not limited to the head of the G-12 Lateral (M&R No. 80070); the Canal Lateral facilities, including, but not limited to, the interconnection between the Canal Lateral and Algonquin's mainline; the Cape Cod Lateral facilities, including, but not limited to, the interconnection between the Cape Cod Lateral and the Canal Lateral; the Northeast Gateway Lateral facilities, including, but not limited to, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts; the J-2 Facility, including, but not limited to the head of the J-2 Facility (M&R No. 80094); the Kleen Energy Lateral facilities, including, but not limited to, the interconnection between the Kleen Energy Lateral and the Middletown Lateral; or the West Roxbury Lateral facilities, including, but not limited to, the interconnection between the West Roxbury Lateral and Algonquin's mainline, as specified in Customer's executed AIT-2 Service Agreement, and the facilities of other operators shall be available for use by Customer as Point(s) of Delivery.

7. GENERAL TERMS AND CONDITIONS

The applicable General Terms and Conditions of this FERC Gas Tariff are hereby made a part of this rate schedule.

## **41. REVENUE CREDITS**

### **41.1 Interruptible Transportation and Park and Loan Service**

- (a) Applicability. The credit available under this Section 41.1 for revenues under Rate Schedules AIT-1 and PAL shall apply to all Service Agreements under firm Part 284 transportation service rate schedules, except for Service Agreements for service on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, and the West Roxbury Lateral under Rate Schedule AFT-CL. The credit available under this Section 41 for revenues under Rate Schedule AIT-2 attributable to service on the Brayton Point Lateral shall apply only to Service Agreements for service on the Brayton Point Lateral under Rate Schedule AFT-CL. The credit available under this Section 41 for revenues under Rate Schedule AIT-2 attributable to service on the Manchester Street Lateral shall apply only to Service Agreements for service on the Manchester Street Lateral under Rate Schedule AFT-CL. The credit available under this Section 41 for revenues under Rate Schedule AIT-2 attributable to service on the Canal Lateral shall apply only to Service Agreements for service on the Canal Lateral under Rate Schedule AFT-CL. The credit available under this Section 41 for revenues under Rate Schedule AIT-2 attributable to service on the Cape Cod Lateral shall apply only to Service Agreements for service on the Cape Cod Lateral under Rate Schedule AFT-CL. The credit available under this Section 41 for revenues under Rate Schedule AIT-2 attributable to service on the Northeast Gateway Lateral shall apply only to Service Agreements for service on the Northeast Gateway Lateral under Rate Schedule AFT-CL. The credit available under this Section 41 for revenues under Rate Schedule AIT-2 attributable to service on the J-2 Facility shall apply only to Service Agreements for service on the J-2 Facility under Rate Schedule AFT-CL. The credit available under this Section 41 for revenues under Rate Schedule AIT-2 attributable to service on the Kleen Energy Lateral shall apply only to Service Agreements for service on the Kleen Energy Lateral under Rate Schedule AFT-CL.
- (b) Basis of the Credit. Revenues to which the credit under this Section 41.1 shall apply ("Eligible Revenues") shall be the revenues actually received by Algonquin under Rate Schedules AIT-1 and PAL or Rate Schedule AIT-2 (for interruptible services that have not been allocated cost of service) that are attributable to commodity charges and authorized overrun charges but not including imbalance resolution charges, scheduling penalties, unauthorized contract overrun penalties, GRI, ACA, revenues attributable to Section 8 of Rate Schedule PAL, or any other such charges or surcharges.

(c) Percentage of Eligible Revenues.

- (i) Rate Schedules AIT-1 and PAL. Beginning with the Month following the Month in which Algonquin's cumulative annual revenues stemming from commodity charges and authorized overrun charges under Rate Schedules AIT-1 and PAL exceed the dollar amount allocated to Rate Schedules AIT-1 and PAL in Algonquin's currently effective rates ("Excess Eligible Revenues"), Algonquin shall credit to current Month invoices under the applicable rate schedules 90% of the Excess Eligible Revenues received during the prior Month. For purposes of determining cumulative annual revenues under Rate Schedules AIT-1 and PAL, the annual period shall commence on May 1 of each year. In the event that two or more maximum rates for service under Rate Schedules AIT-1 and PAL are applicable during the same twelve month period beginning on May 1, the threshold for revenue crediting hereunder shall consist of a time-weighted average of the amounts allocated to Rate Schedules AIT-1 and PAL during the periods when the various AIT-1 and PAL rates are in effect. Algonquin shall retain the remainder of the Eligible Revenues and Excess Eligible Revenues not required to be credited or refunded.
- (ii) Rate Schedule AIT-2. Beginning with the Month following the Month in which Algonquin's cumulative annual revenues stemming from commodity charges and authorized overrun charges under Rate Schedule AIT-2 exceed the dollar amount allocated to Rate Schedule AIT-2 in Algonquin's currently effective rates ("Excess Eligible Revenues"), if any, Algonquin shall credit to current Month invoices under the applicable rate schedules 50% of the Excess Eligible Revenues received during the prior Month. For purposes of determining cumulative annual revenues under Rate Schedule AIT-2, the annual period shall commence on May 1 of each year. In the event that two or more maximum rates for service under Rate Schedule AIT-2 are applicable during the same twelve month period beginning on May 1, the threshold for revenue crediting hereunder shall consist of a time-weighted average of the amounts allocated to Rate Schedule AIT-2 during the periods when the various AIT-2 rates are in effect. Algonquin shall retain the remainder of the Eligible Revenues and Excess Eligible Revenues not required to be credited or refunded.
- (d) Apportionment of Eligible Revenues. Eligible Revenues attributable to a Month shall be apportioned among all Customers under the applicable rate schedules by applying the following ratio for each Customer: (a) the Customer's total MDTQ in effect during that Month under the applicable

rate schedules (b) divided by the summation of the total MDTQs in effect during that Month for all Customers under the applicable rate schedules; provided, however, that no Customer shall receive a credit under this Section 41.1 in excess of its reservation charges under the applicable rate schedules for that Month, with such excess being reallocated to the other Customers under the applicable rate schedule in accordance with the above ratios.

- (e) Credits Subject to Refund. In the event that any revenues credited pursuant to Section 41.1 are subject to refund, and are ultimately required to be refunded to Customers under Rate Schedules AIT-1 and PAL or Rate Schedule AIT-2, Algonquin shall recalculate the revenue credits that would have been due to Customer if the AIT-1 and PAL rates or AIT-2 rate, respectively, used for purposes of the refund computation had been in effect at the time of the required credit, and shall bill Customer for the differences between revenues actually credited, and the recalculated revenue credit, plus interest at the rate prescribed by the Commission's regulations.

#### 41.2 Retained Upstream Capacity Release Credits.

- (a) Applicability. The credit available under this Section 41.2 shall apply to all firm rate schedules except Rate Schedule AFT-CL.
- (b) Basis of the Credit. Revenues to which the credit under this Section 41.2 shall apply ("Eligible Capacity Release Revenues") shall be the revenues actually received by Algonquin that are attributable to demand charges paid by parties to which Algonquin has released upstream capacity rights held by Algonquin, to the extent that the costs of such rights have been reflected in the rates paid by Customers under the rate schedules identified in Section 41.2(a).
- (c) Apportionment of Eligible Capacity Release Revenues. Eligible Revenues attributable to a Month shall be apportioned among all Customers under the applicable rate schedules by applying the following ratio for each Customer: (i) the Customer's total MDTQ in effect during that Month under the applicable rate schedules, (ii) divided by the summation of the total MDTQs in effect during that Month for all Customers under the applicable rate schedules, provided that, in the case of a Customer paying less than the maximum reservation charge during any Month, the Customer's MDTQ for purposes of both (i) and (ii) above shall be reduced in the same proportion as the reservation charge paid bears to the maximum reservation charge.

**FORM OF SERVICE AGREEMENT  
(APPLICABLE TO RATE SCHEDULE AFT-CL)**

Date: \_\_\_\_\_,

Contract No. \_\_\_\_\_

**SERVICE AGREEMENT**

This AGREEMENT is entered into by and between Algonquin Gas Transmission, LLC, ("Algonquin") and \_\_\_\_\_ ("Customer").

WHEREAS, [this and an additional clause(s) may be included to describe the historical or factual context of the Agreement, to describe or identify a precedent agreement, and any other agreements if applicable, between Algonquin and Customer related to the Agreement, and/or to describe or define the facilities necessary to provide service under the Agreement, and will not include binding consideration.]

***[In the event that the capacity was awarded as Interim Capacity pursuant to Section 2.6 of the General Terms and Conditions of the Algonquin Tariff, the following language will be included as a Whereas clause in Customer's Agreement:*** "The service provided to Customer under this Agreement will utilize capacity that was acquired by Customer as Interim Capacity pursuant to the provisions of Section 2.6 of the General Terms and Conditions of the Algonquin Tariff."]

NOW THEREFORE, in consideration of the premises and of the mutual covenants herein contained, the parties do agree as follows:

1. Algonquin shall deliver and Customer shall take and pay for service on Algonquin's [Canal Lateral, Middletown Lateral, Cleary Lateral, Lake Road Lateral, Brayton Point Lateral, Bellingham Lateral, Phelps Dodge Lateral, Manchester Street Lateral, Cape Cod Lateral, Northeast Gateway Lateral, J-2 Facility, Kleen Energy Lateral, or West Roxbury Lateral, as applicable,] pursuant to the terms of this Agreement and subject to Algonquin's Rate Schedule AFT-CL and the General Terms and Conditions of Algonquin's Tariff, which are incorporated herein by reference and made a part hereof.

***[In the event that a precedent agreement for a new or an expansion project contains credit provisions applicable to Customer's capacity related to such project, the following language shall be included in Customer's Service Agreement.*** "The credit requirements applicable to this Agreement are set forth in that certain Precedent Agreement dated \_\_\_\_\_ between Algonquin and Customer related to this Agreement."]

2. The Maximum Daily Transportation Quantity (MDTQ) and Maximum Annual Transportation Quantity (MATQ) for service under this Agreement and any right to increase or decrease the MDTQ or MATQ during the term of this Agreement are listed on Exhibit C attached hereto. The Point(s) of Receipt and Point(s) of Delivery, respectively, are listed on Exhibits A and B attached hereto. Exhibit(s) A, B, and C are incorporated herein by reference and made a part hereof.
3. This Agreement shall be effective on \_\_\_\_\_ [this blank may include a date certain, a date either earlier or later than a specified date certain based on the completion of construction of facilities necessary to provide service under the Agreement, a date set forth in or established by a relevant order from the Federal Energy Regulatory Commission or a commencement date as defined in a precedent agreement between Customer and Algonquin] and shall continue for a term ending on and including \_\_\_\_\_ [or, when applicable, "shall continue for a term of \_\_\_\_\_ years"] ("Primary Term") and shall continue to be effective from \_\_\_\_\_ to \_\_\_\_\_ thereafter ***[In the event that the capacity was awarded as Interim Capacity pursuant to Section 2.6 of the General Terms and Conditions of the Algonquin Tariff, the following phrase will be included in Customer's Agreement:*** "but in no event beyond \_\_\_\_\_,"] unless and until terminated by Algonquin or Customer upon prior written notice of at

least \_\_\_\_\_ [not less than 1 year for agreements with a primary term of more than 1 year; for service agreements with both a primary term and notice period of exactly one (1) year, the notice must be submitted within ten (10) Business Days of the beginning of the primary term of the service agreement, and at least one (1) year for subsequent notices for such service agreement; and otherwise mutually agreeable]. [In the event that Algonquin and Customer agree to a fixed term, the evergreen and notice of termination language shall be omitted from Customer's Agreement.] This Agreement may be terminated at any time by Algonquin in the event Customer fails to pay part or all of the amount of any bill for service hereunder and such failure continues for thirty days after payment is due; provided Algonquin gives ten days prior written notice to Customer of such termination and provided further such termination shall not be effective if, prior to the date of termination, Customer either pays such outstanding bill or furnishes a good and sufficient surety bond or other form of security reasonably acceptable to Algonquin guaranteeing payment to Algonquin of such outstanding bill; provided that Algonquin shall not be entitled to terminate service pending the resolution of a disputed bill if Customer complies with the billing dispute procedure currently on file in Algonquin's Tariff. Any portions of this Agreement necessary to correct or cash-out imbalances under this Agreement as required by the General Terms and Conditions of Algonquin's Tariff shall survive the other parts of this Agreement until such time as such balancing has been accomplished.

If this Agreement qualifies as a "ROFR Agreement" as defined in the General Terms and Conditions of Algonquin's Tariff, the provision of a termination notice by either Customer or Algonquin, pursuant to the preceding paragraph, a notice of partial reduction in Maximum Daily Transportation Quantity and Maximum Annual Transportation Quantity pursuant to Exhibit C or the expiration of this Agreement of its own terms triggers Customer's right of first refusal under Section 9 of the General Terms and Conditions of Algonquin's Tariff.

***[In the event that the capacity was awarded as Interim Capacity pursuant to Section 2.6 of the General Terms and Conditions of the Algonquin Tariff, the previous paragraph will be replaced with the following language: "This Agreement does not qualify as a ROFR Agreement, as such term is defined in Section 1 of the General Terms and Conditions of the Algonquin Tariff."]***

4. Maximum rates, charges, and fees shall be applicable to service pursuant to this Agreement except during the specified term of a discounted rate or a Negotiated Rate to which Customer and Algonquin have agreed. Provisions governing such discounted rate shall be as specified in the Discount Confirmation to this Agreement. Provisions governing such Negotiated Rate and term shall be as specified on an appropriate Statement of Negotiated Rates filed, with the consent of Customer, as part of Algonquin's Tariff. It is further agreed that Algonquin may seek authorization from the Commission and/or other appropriate body at any time and from time to time to change any rates, charges or other provisions in the applicable Rate Schedule and General Terms and Conditions of Algonquin's Tariff, and Algonquin shall have the right to place such changes in effect in accordance with the Natural Gas Act. Nothing contained herein shall be construed to deny Customer any rights it may have under the Natural Gas Act, including the right to participate fully in rate or other proceedings by intervention or otherwise to contest increased rates in whole or in part.
5. Unless otherwise required in the Tariff, all notices shall be in writing and shall be considered duly delivered when mailed to the applicable address below or transmitted via facsimile. Customer or Algonquin may change the addresses or other information below by written notice to the other without the necessity of amending this Agreement:

Algonquin:

Customer:

6. The interpretation and performance of this Agreement shall be in accordance with the laws of the Commonwealth of Massachusetts, excluding conflicts of law principles that would require the application of the laws of a different jurisdiction.
7. This Agreement supersedes and cancels, as of the effective date of this Agreement, the contract(s) between the parties hereto as described below, if applicable:

[None or an appropriate description]

IN WITNESS WHEREOF, the parties hereto have caused this Agreement to be signed by their respective Officers and/or Representatives thereunto duly authorized to be effective as of the date stated above.

**RATE SCHEDULE AFT-1**  
**FIRM TRANSPORTATION SERVICE**

1. **AVAILABILITY**

This rate schedule is available for firm transportation of natural gas by Algonquin Gas Transmission, LLC (hereinafter called "Algonquin") for any party (hereinafter called "Customer"), when:

- a. Customer has made a valid request for firm transportation pursuant to Section 2 of the General Terms and Conditions of this FERC Gas Tariff of which this rate schedule is a part;
- b. Sufficient firm capacity is available to effectuate such transportation without any construction of facilities or other investment by Algonquin, or Algonquin has waived this requirement in writing;
- c. The Primary Point(s) of Receipt and Primary Point(s) of Delivery requested by Customer are acceptable to Algonquin from the viewpoint of adequacy of Algonquin's existing facilities to receive and transport Customer's gas with Algonquin's existing firm service taking precedence; and
- d. Customer has executed a service agreement in the form contained in the FERC Gas Tariff of which this rate schedule is a part.
- e. Transportation service effectuated through capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, ~~or~~ the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL is not available under this rate schedule; provided, however that the interconnection between the Brayton Point Lateral and Algonquin's mainline (M&R No. 80035), the interconnection between the Manchester Street Lateral and Algonquin's mainline (M&R No. 80071), the interconnection between the Canal Lateral and Algonquin's mainline (M&R No. 8004), the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline (M&R 80095), ~~and~~ the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline (M&R No. 80104) are available under this Rate Schedule AFT-1.

2. **APPLICABILITY AND CHARACTER OF SERVICE**

- 2.1 Transportation service hereunder will be on a firm basis except as provided herein and in Sections 16 and 24 of the General Terms and Conditions of this tariff. Algonquin shall receive from Customer, or for the account of Customer, at those

points on Algonquin's system as specified in an executed AFT-1 Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Receipt") for transportation hereunder daily quantities of gas tendered for the account of Customer up to Customer's Maximum Daily Transportation Quantity ("MDTQ") plus an amount reflecting the Fuel Reimbursement Quantity as defined in Section 32 of the General Terms and Conditions of this tariff and, on a cumulative basis in any year, up to Customer's Maximum Annual Transportation Quantity ("MATQ") as specified in the service agreement, except as provided in Section 2.6 herein below, plus amounts reflecting the Fuel Reimbursement Quantity; provided, however, Algonquin shall not be obligated to, but may at its option, receive at any Point(s) of Receipt on any Day a quantity of gas in excess of the applicable Maximum Daily Receipt Obligation ("MDRO") plus any applicable Fuel Reimbursement Quantity, provided that, if more than one Customer requests receipts in excess of its MDRO at a Point of Receipt, and the sum of all such requests exceeds the available capacity at such Point of Receipt, Algonquin shall apportion such receipts in excess of MDRO among such Customers pro rata according to the Customers' firm MDROs at the relevant Point of Receipt.

- 2.2 Upon receipt of such natural gas for Customer's account, Algonquin shall, after making allowance for the Fuel Reimbursement Quantity, transport and deliver hourly quantities of gas required by Customer up to Customer's Maximum Hourly Transportation Quantity ("MHTQ") at those points on Algonquin's system as are specified in an executed AFT-1 Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Delivery"); provided, however, Algonquin shall not be obligated to, but may at its option, deliver at any Point(s) of Delivery an hourly quantity exceeding the MHTQ, and on any Day a quantity of gas in excess of the applicable Maximum Daily Delivery Obligation ("MDDO"), provided that, if more than one Customer requests deliveries in excess of its MDDO at a Point of Delivery, and the sum of all such requests exceeds the available capacity at such Point of Delivery, Algonquin shall apportion such deliveries in excess of MDDO among such Customers pro rata according to the Customers' firm MDDOs at the relevant Point of Delivery.
- 2.3 Provided such quantities have been scheduled in accordance with Section 23 of the General Terms and Conditions, Customer may tender quantities of gas in excess of the MDTQ plus any applicable Fuel Reimbursement Quantity on any Day if in Algonquin's reasonable judgment transportation of such gas can be accomplished by Algonquin without detriment to any other Customer under any of Algonquin's rate schedules. Such excess quantities shall be deemed to be Authorized Overrun Quantities.
- 2.4 Algonquin shall not be obligated to add any facilities or expand the capacity of Algonquin's pipeline system in any manner in order to provide transportation service to Customer pursuant to this rate schedule; provided, however, Algonquin may, at its option, and with Customer's consent, add facilities or expand capacity to provide such transportation service, subject to Section 42.

- 2.5 Unless otherwise specified in the applicable service agreement, services hereunder shall be available on any day of the year, subject to Customer's MATQ and MDTQ limitations.
- 2.6 With respect to existing service agreements resulting from the conversion pursuant to Order No. 636 of sales and storage service under former Rate Schedules F-1, WS-1, STB and SS-3, subject to Algonquin's firm service obligations from primary points of receipt to primary points of delivery Algonquin shall provide service above Customer's MATQ up to but not in excess of the highest MDTQ on which Customer's Reservation Charge during the currently effective term of the service agreement is based, specified in the executed service agreement multiplied by 365 (366 for a leap year) and, on any Day, Algonquin shall provide service above Customer's current MDTQ for a given season up to but not in excess of the highest MDTQ on which Customer's Reservation Charge during the currently effective term of the service agreement is based provided, however, that such additional quantities shall be provided with the same priority for purposes of scheduling accorded to service meeting the criteria of Section 48.3(a)(1) of the General Terms and Conditions of this tariff only to the extent these quantities are requested to be scheduled from a receipt point located within the Base Flow Path to a delivery point located within the Base Flow Path, and provided further, that for purposes of Curtailment Customer's maximum daily entitlement shall be the highest MDTQ specified in Customer's executed service agreement during the period of Curtailment. Such additional quantities shall be subject to fuel, the applicable commodity rate and any applicable commodity surcharges.

### 3. RATE

- 3.1 Unit Rates. The applicable maximum and minimum unit rates are set forth in the currently effective Statement of Rates for Rate Schedule AFT-1 of this tariff and are hereby incorporated herein. Such rates are subject to adjustment pursuant to Section 33 and Section 34 of the General Terms and Conditions of this tariff. The applicable unit rates to be charged on any Day by Algonquin for gas delivered to Customer shall not be in excess of the maximum unit rate nor less than the minimum unit rate.
- 3.2 Monthly Bill for Forwardhaul Rates. For Customers executing an AFT-1 Service Agreement for transportation which is not solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AFT-1 Service Agreement is effective and for each Month thereafter unless otherwise specified in the applicable service agreement, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:

- (a) Reservation Charge: The charge per Month per Dth of Customer's highest MDTQ during the Contract Year, as specified in Customer's executed AFT-1 Service Agreement; plus
- (b) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
- (c) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
- (d) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (e) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (f) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions; less
- (g) Revenue Credit: The revenue credit provided for in Section 41 of the General Terms and Conditions.

3.3 Monthly Bill for Backhaul Rates. For Customers executing an AFT-1 Service Agreement for transportation which is solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AFT-1 Service Agreement is effective and for each Month thereafter unless otherwise specified in the applicable Service Agreement, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:

- (a) Reservation Charge: The charge per Month per Dth of Customer's highest MDTQ during the Contract Year, as specified in Customer's executed AFT-1 Service Agreement; plus
- (b) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
- (c) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus

- (d) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (e) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (f) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions; less
- (g) Revenue Credit: The revenue credit provided for in Section 41 of the General Terms and Conditions.

#### 4. NOMINATIONS AND SCHEDULING OF RECEIPTS AND DELIVERIES

- 4.1 Nominations and Scheduling. If Customer desires transportation of natural gas on any Day under this rate schedule, Customer shall provide a nomination to Algonquin in accordance with Section 22 of the General Terms and Conditions of this tariff. Based upon the nomination of Customer, Algonquin shall schedule receipts and deliveries of gas in accordance with the General Terms and Conditions. It is the responsibility of Customer to adjust its deliveries and receipts to conform to the scheduled quantities.
- 4.2 Delivery of Gas. Based upon the daily quantity scheduled, Algonquin shall make daily delivery of Customer's scheduled quantity taking into account the Fuel Reimbursement Quantity. It is the intention of Algonquin that daily deliveries of gas at the Point(s) of Delivery by Algonquin hereunder shall be as nearly equal as possible to daily receipts of gas at the Point(s) of Receipt by Algonquin for transportation hereunder, less the applicable Fuel Reimbursement Quantity. Any excess or deficiency in such receipts, less the applicable Fuel Reimbursement Quantity, and deliveries shall be resolved in accordance with the General Terms and Conditions of this tariff. Nothing in this rate schedule shall limit Algonquin's right to take actions pursuant to Section 26 of the General Terms and Conditions of this tariff.
- 4.3 Commingling of Gas. From the time the natural gas is received by Algonquin at the Point(s) of Receipt, Algonquin shall have the unqualified right to commingle such natural gas with other gas in Algonquin's system.

#### 5. OTHER OPERATING CONDITIONS

Algonquin's obligation to provide service under this rate schedule is subject to the following conditions being satisfied:

- 5.1 Customer shall make all necessary arrangements with other parties at or upstream of the Point(s) of Receipt where Customer tenders gas to Algonquin for transportation, and at or downstream of the Point(s) of Delivery where Algonquin delivers gas for Customer's account, and such arrangements must be compatible with Algonquin's system operations.
- 5.2 Algonquin shall schedule receipts at a Secondary Point of Receipt or deliveries at a Secondary Point of Delivery pursuant to the provisions of Sections 48.2 and 48.3 of the General Terms and Conditions.
- 5.3 To the extent that any upstream entity involved in handling Customer's gas refuses or is unable to deliver gas to Algonquin, Algonquin shall not be required to continue deliveries of gas on behalf of Customer. Prior to any reduction or interruption in service due to the failure of the upstream entity to deliver gas on behalf of Customer, Algonquin shall provide notice in a time and manner that is reasonable under then existing conditions. To the extent that any downstream entity involved in handling Customer's gas refuses or is unable to receive gas from Algonquin, Algonquin shall have the right to reduce deliveries of gas on behalf of Customer.
- 5.4 The daily quantities of natural gas transported shall be delivered at the Point(s) of Receipt at an hourly rate of 1/24th of the scheduled daily quantity. The daily quantities of natural gas transported shall be accepted at the Point(s) of Delivery at a substantially constant hourly rate or, in the case of service agreements resulting from the conversion pursuant to Order No. 636 of sales entitlements under former Rate Schedules F-1 and WS-1, at a rate no greater than .06 multiplied by the scheduled daily quantity.

6. POINT(S) OF RECEIPT AND DELIVERY

- 6.1 (A) Primary Points of Receipt: The Primary Point(s) of Receipt at which Algonquin shall receive gas for transportation under this rate schedule shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Primary Point of Receipt the MDRO and receipt pressure obligations. Such exhibit by mutual written agreement may be superseded by a new exhibit which may add or delete specific points or make other changes thereto that the parties deem appropriate. Algonquin shall not accept any proposed Primary Point(s) of Receipt, or quantity at any Primary Point(s) of Receipt, or change in quantities among Primary Point(s) of Receipt if (a) the resulting aggregate MDROs at all of Customer's Primary Point(s) of Receipt would exceed Customer's MDTQ, or (b) in doing so, in Algonquin's reasonable judgment, Algonquin would impair its ability to satisfy its existing firm obligations to receive gas pursuant to other firm service agreements under which such Point(s) of Receipt are Primary Points of Receipt and to purchase and receive its Company Use Gas at maximum deliverability levels, as such

Company Use Gas arrangements exist under agreements effective at the date of Customer's request or reasonably expected by Algonquin to be effective within six months of the request.

- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators for use as a Primary Point of Receipt in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Receipt to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In the event that Replacement Customer selects a new Primary Point of Receipt that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Receipt, shall revert to the Releasing Customer, and any Primary Points of Receipt granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.

- 6.2 Secondary Points of Receipt: Notwithstanding the foregoing, all interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt, with the exception of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, ~~or~~ the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, ~~and~~ the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline are available as Secondary Points of Receipt under this Rate Schedule AFT-1. Such use of Secondary Points

of Receipt is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.

- 6.3 (A) Primary Points of Delivery: The Primary Point(s) of Delivery at which Algonquin shall deliver gas for Customer's account under this rate schedule shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Point of Delivery the MDDO and delivery pressure obligations. Algonquin shall not accept any proposed Primary Point(s) of Delivery, or quantity at any Primary Point(s) of Delivery, or change in quantities among Primary Point(s) of Delivery if the resulting aggregate MDDOs at all of Customer's Primary Point(s) of Delivery would exceed Customer's MDTQ except to the extent Customer's MDDOs reflect the conversion of pre-existing entitlements under firm sales agreements.
- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators for use as a Primary Point of Delivery in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Delivery to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In the event that Replacement Customer selects a new Primary Point of Delivery that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Delivery, shall revert to the Releasing Customer, and any Primary Points of Delivery granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.
- 6.4 Secondary Points of Delivery: Notwithstanding the foregoing, all interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery, with the exception of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, ~~or~~ the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral

facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, ~~and~~ the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline are available as Secondary Points of Delivery under this Rate Schedule AFT-1. Such use of Secondary Points of Delivery is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.

7. GENERAL TERMS AND CONDITIONS

The applicable General Terms and Conditions of this FERC Gas Tariff are hereby made a part of this rate schedule.

**RATE SCHEDULE AFT-E**  
**FIRM TRANSPORTATION SERVICE**

1. **AVAILABILITY**

This rate schedule is available for firm transportation of natural gas by Algonquin Gas Transmission, LLC (hereinafter called "Algonquin") for any party (hereinafter called "Customer"), when:

- a. Customer has made a valid request for firm transportation pursuant to Section 2 of the General Terms and Conditions of this FERC Gas Tariff of which this rate schedule is a part;
- b. Sufficient firm capacity is available to effectuate such transportation without any construction of facilities or other investment by Algonquin, or Algonquin has waived this requirement in writing;
- c. The Primary Point(s) of Receipt and Primary Point(s) of Delivery requested by Customer are acceptable to Algonquin from the viewpoint of adequacy of Algonquin's existing facilities to receive and transport Customer's gas with Algonquin's existing firm service taking precedence;
- d. Customer has contracted with one or more operators of upstream facilities that interconnect with the Algonquin system (the "Upstream Entity(ies)"), for a sufficient quantity of no-notice transportation services that encompass the right on the part of Customer to increase or decrease its receipts from the Upstream Entity(ies) into designated Points of Receipt on Algonquin's system with no advance notice, up to Customer's MDTQ under this Rate Schedule AFT-E plus fuel as provided for in Section 32 of the General Terms and Conditions of this tariff in the case of increases in receipts, or down to zero in the case of decreases in receipts, without regard to any quantities that Customer previously scheduled on the Upstream Entities, and with no requirement that Customer adhere to a constant rate of flow on the Upstream Entities (the "Upstream Arrangements").
- e. Customer has named a contact party (the "Notice Agent") for the receipt of orders issued in accordance with Section 5 ("Section 5 Orders") of this rate schedule;
- f. Customer has authorized Algonquin to exercise Customer's nomination and scheduling rights under the Upstream Arrangements, if necessary by executing agency instruments satisfactory to the Upstream Entity, to the extent required to permit service under this rate schedule; and
- g. Customer has executed a service agreement in the form contained in the FERC Gas Tariff of which this rate schedule is a part.

- h. Transportation service effectuated through capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, ~~or~~ the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL is not available under this rate schedule; provided, however that the interconnection between the Brayton Point Lateral and Algonquin's mainline (M&R No. 80035), the interconnection between the Manchester Street Lateral and Algonquin's mainline (M&R No. 80071), the interconnection between the Canal Lateral and Algonquin's mainline (M&R No. 8004), the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline (M&R No. 80095), ~~and~~ the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline (M&R No. 80104) are available under this Rate Schedule AFT-E.

## 2. APPLICABILITY AND CHARACTER OF SERVICE

- 2.1 Transportation service hereunder will be on a firm basis except as provided herein and in Sections 16 and 24 of the General Terms and Conditions of this tariff. Algonquin shall receive from Customer, or for the account of Customer, at those points on Algonquin's system as specified in an executed AFT-E Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Receipt") for transportation hereunder daily quantities of gas tendered for the account of Customer up to Customer's Maximum Daily Transportation Quantity ("MDTQ") plus an amount reflecting the Fuel Reimbursement Quantity as defined in Section 32 of the General Terms and Conditions of this tariff and, on a cumulative basis in any year, up to Customer's Maximum Annual Transportation Quantity ("MATQ") as specified in the service agreement, except as provided in Section 2.7 herein below, plus amounts reflecting the Fuel Reimbursement Quantity; provided however, Algonquin shall not be obligated to, but may at its option, receive at any Point(s) of Receipt on any Day a quantity of gas in excess of the applicable Maximum Daily Receipt Obligation ("MDRO") plus any applicable Fuel Reimbursement Quantity, provided that, if more than one Customer requests receipts in excess of its MDRO at a Point of Receipt, and the sum of all such requests exceeds the available capacity at such Point of Receipt, Algonquin shall apportion such receipts in excess of MDRO among such Customers pro rata according to the Customers' firm MDROs at the relevant Point of Receipt.
- 2.2 Upon receipt of such natural gas for Customer's account, Algonquin shall, after making allowance for the Fuel Reimbursement Quantity, transport and deliver hourly quantities of gas required by Customer up to Customer's Maximum Hourly Transportation Quantity ("MHTQ") at those points on Algonquin's system as are specified in an executed AFT-E Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Delivery"); provided however, Algonquin shall not be obligated to, but may at its option, deliver at any Point(s) of

Delivery an hourly quantity exceeding the MHTQ, and on any Day a quantity of gas in excess of the applicable Maximum Daily Delivery Obligation ("MDDO"), provided that, if more than one Customer requests deliveries in excess of its MDDO at a Point of Delivery, and the sum of all such requests exceeds the available capacity at such Point of Delivery, Algonquin shall apportion such deliveries in excess of MDDO among such Customers pro rata according to the Customers' firm MDDOs at the relevant Point of Delivery.

- 2.3 Provided such quantities have been scheduled in accordance with Section 23 of the General Terms and Conditions, Customer may tender quantities of gas in excess of the MDTQ plus any applicable Fuel Reimbursement Quantity on any Day if in Algonquin's reasonable judgment transportation of such gas can be accomplished by Algonquin without detriment to any other Customer under any of Algonquin's rate schedules. Such excess quantities shall be deemed to be Authorized Overrun Quantities.
- 2.4 Algonquin shall not be obligated to add any facilities or expand the capacity of Algonquin's pipeline system in any manner in order to provide transportation service to Customer pursuant to this rate schedule; provided, however, Algonquin may, at its option, and with Customer's consent, add facilities or expand capacity to provide such transportation service, subject to Section 42.
- 2.5 Subject to the conditions specified in Section 5 of this Rate Schedule, service hereunder shall encompass the right on the part of Customer to increase deliveries at the Point(s) of Delivery up to the MDTQ and to decrease deliveries at the Point(s) of Delivery without advance notice to Algonquin and without Customer's previously having provided for a concurrent increase or decrease in receipts at the Point(s) of Receipt.
- 2.6 Unless otherwise specified in the applicable service agreement, service hereunder shall be available on any day of the year, subject to Customer's MATQ and MDTQ limitations.
- 2.7 With respect to existing service agreements resulting from the conversion pursuant to Order No. 636 of sales and storage service under former Rate Schedules F-1, WS-1, STB and SS-3, subject to Algonquin's firm service obligations from primary points of receipt to primary points of delivery Algonquin shall provide service above Customer's MATQ up to but not in excess of the highest MDTQ on which Customer's Reservation Charge during the currently effective term of the service agreement is based, specified in the executed service agreement multiplied by 365 (366 for a leap year) and, on any Day, Algonquin shall provide service above Customer's current MDTQ for a given season up to but not in excess of the highest MDTQ on which Customer's Reservation Charge during the currently effective term of the service agreement is based; provided, however, that such additional quantities shall be provided with the same priority for purposes of scheduling accorded to service meeting the criteria of Section 48.3(a)(1) of the General Terms

and Conditions of this tariff only to the extent these quantities are requested to be scheduled from a receipt point located within the Base Flow Path to a delivery point located within the Base Flow Path, and provided further, that for purposes of Curtailment Customer's maximum daily entitlement shall be the highest MDTQ specified in Customer's executed service agreement during the period of Curtailment. Such additional quantities shall be subject to fuel, the applicable commodity rate and any applicable commodity surcharges.

### 3. RATE

- 3.1 Unit Rates. The applicable maximum and minimum unit rates are set forth in the currently effective Statement of Rates for Rate Schedule AFT-E of this tariff and are hereby incorporated herein. Such rates are subject to adjustment pursuant to Section 33 and Section 34 of the General Terms and Conditions of this tariff. The applicable unit rates to be charged on any Day by Algonquin for gas delivered to Customer shall not be in excess of the maximum unit rate nor less than the minimum unit rate.
- 3.2 Monthly Bill for Forwardhaul Rates. For Customers executing an AFT-E Service Agreement for transportation which is not solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AFT-E Service Agreement is effective and for each Month thereafter unless otherwise specified in the applicable service agreement, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:
- (a) Reservation Charge: The charge per Month per Dth of Customer's highest MDTQ during the Contract Year, as specified in Customer's executed AFT-E Service Agreement; plus
  - (b) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
  - (c) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
  - (d) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
  - (e) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus

- (f) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions; less
- (g) Revenue Credit: The revenue credit provided for in Section 41 of the General Terms and Conditions.

3.3 Monthly Bill for Backhaul Rates. For Customers executing an AFT-E Service Agreement for transportation which is solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AFT-E Service Agreement is effective and for each Month thereafter unless otherwise specified in the applicable Service Agreement, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:

- (a) Reservation Charge: The charge per Month per Dth of Customer's highest MDTQ during the Contract Year, as specified in Customer's executed AFT-E Service Agreement; plus
- (b) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
- (c) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
- (d) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (e) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (f) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions; less
- (g) Revenue Credit: The revenue credit provided for in Section 41 of the General Terms and Conditions.

#### 4. NOMINATIONS AND SCHEDULING OF RECEIPTS AND DELIVERIES

4.1 Nominations and Scheduling. If Customer desires transportation of natural gas on any Day under this rate schedule, Customer shall provide a nomination to Algonquin in accordance with Section 22 of the General Terms and Conditions of

this tariff. Based upon the nomination of Customer, Algonquin shall schedule receipts and deliveries of gas in accordance with the General Terms and Conditions. It is the responsibility of Customer to adjust its deliveries and receipts to conform to the scheduled quantities.

- 4.2 Delivery of Gas. Based upon the daily quantity scheduled and in accordance with Section 5 herein, Algonquin shall make daily delivery of Customer's scheduled quantity taking into account the Fuel Reimbursement Quantity. It is the intention of Algonquin that daily deliveries of gas at the Point(s) of Delivery by Algonquin hereunder shall be as nearly equal as possible to daily receipts of gas at the Point(s) of Receipt by Algonquin for transportation hereunder, less the applicable Fuel Reimbursement Quantity. Any excess or deficiency in such receipts, less the applicable Fuel Reimbursement Quantity, and deliveries shall be resolved in accordance with the General Terms and Conditions of this tariff. Nothing in this rate schedule shall limit Algonquin's right to take actions pursuant to Section 26 of the General Terms and Conditions of this tariff.
- 4.3 No-Notice Service. Notwithstanding the quantities nominated by Customer and scheduled by Algonquin hereunder, Customer shall be entitled to increase its deliveries up to the MDDO at any point, up to the MHTQ during any Hour, and up to the MDTQ, or to decrease its deliveries. Provided that all of the operational conditions specified in Section 5 of this rate schedule (the "Section 5 Conditions") are met, Algonquin shall consent to such increase or decrease in deliveries, thereby nullifying any daily scheduling or hourly scheduling penalty that would otherwise be applicable pursuant to Section 23 of the General Terms and Conditions. Furthermore, if the Section 5 Conditions are met, Algonquin will forbear from taking action pursuant to Section 26 of the General Terms and Conditions to reduce deliveries to Customer. If any of the Section 5 Conditions are not met, Algonquin shall not be required to receive or deliver gas in amounts other than the transportation quantities scheduled by Customer, and variations between scheduled quantities and actual deliveries to Customer's meter shall be subject to the assessment of penalties pursuant to Section 23 of the General Terms and Conditions.
- 4.4 Commingling of Gas. From the time the natural gas is received by Algonquin at the Point(s) of Receipt, Algonquin shall have the unqualified right to commingle such natural gas with other gas in Algonquin's system.

5. OTHER OPERATING CONDITIONS

Algonquin's obligation to provide service under this rate schedule is subject to the following conditions being satisfied:

- 5.1 Customer shall make all necessary arrangements, including the Upstream Arrangements, with other parties at or upstream of the Point(s) of Receipt where Customer tenders gas to Algonquin for transportation, and at or downstream of the

Point(s) of Delivery where Algonquin delivers gas for Customer's account, and such arrangements must be compatible with Algonquin's system operations.

- 5.2 Algonquin shall schedule receipts at a Secondary Point of Receipt or deliveries at a Secondary Point of Delivery pursuant to the provisions of Sections 48.2 and 48.3 of the General Terms and Conditions.
- 5.3 To the extent that any Upstream Entity involved in handling Customer's gas refuses or is unable to deliver gas to Algonquin, Algonquin shall not be required to continue deliveries of gas on behalf of Customer. Prior to any reduction or interruption in service due to the failure of the Upstream Entity to deliver gas on behalf of Customer, Algonquin shall provide notice in a time and manner that is reasonable under then existing conditions. To the extent that any downstream entity involved in handling Customer's gas refuses or is unable to receive gas from Algonquin, Algonquin shall have the right to reduce deliveries of gas on behalf of Customer.
- 5.4 The Upstream Arrangements must be in full force and effect; Customer shall not be in default of the Upstream Arrangements; and Customer's rights under the Upstream Arrangements shall be enforceable by Customer or its agents without impairment due to curtailment, force majeure or other reasons.
- 5.5 The Upstream Entity(ies) shall recognize Algonquin's rights as Customer's agent to issue orders ("Section 5 Orders") on Customer's behalf nominating or directing for Customer's account no-notice service as encompassed within the Upstream Arrangements at such levels and at such times as Algonquin determines in its reasonable discretion is required by the Algonquin system to meet the needs of Customer under this rate schedule.
- 5.6 All Upstream Entities involved in all Upstream Arrangements with Customer served under this rate schedule shall deliver to the various points of interconnection between Algonquin's facilities and the facilities of the various Upstream Entities such quantities of gas at such times as Algonquin determines in its reasonable discretion are required by the Algonquin system to meet the needs of Customer under this rate schedule.
- 5.7 Customer's Notice Agent must have complete authority to call upon supplies for Customer's account at such times, in such quantities, and at such locations as Algonquin deems necessary, in its reasonable discretion, to enable Algonquin to provide service as contemplated for Customer under this rate schedule.
- 5.8 All Notice Agents named by Customer under this rate schedule shall execute Section 5 Orders at such locations and at such times as Algonquin determines in its reasonable discretion are necessary to enable Algonquin to provide service as contemplated under Rate Schedules AFT-E and AFT-ES.

- 5.9 The daily quantities of natural gas transported shall be delivered at the Point(s) of Receipt at an hourly rate of 1/24th of the scheduled daily quantity. The daily quantities of natural gas transported shall be accepted at the Point(s) of Delivery at a substantially constant hourly rate or, in the case of service agreements resulting from the conversion pursuant to Order No. 636 of sales entitlements under former Rate Schedules F-1 and WS-1, at an hourly rate no greater than .06 multiplied by the scheduled daily quantity.
- 5.10 In the event Customer has multiple upstream no-notice services pursuant to more than one contract, from more than one pipeline, or under more than one rate schedule, Customer shall provide Algonquin a predetermined order of preference for these upstream services. Algonquin shall follow this order of preference in scheduling Customer's upstream no-notice service. Customer may, upon twenty-four hours' written notice to Algonquin, modify this specification of scheduling preferences.
- 5.11 In the event Algonquin issues a Section 5 Order on Customer's behalf, Algonquin shall provide notice as soon as possible to Customer and Customer's Notice Agent by telephone or facsimile and by posting on the Internet Web Site that the Section 5 Order has been issued.

6. POINT(S) OF RECEIPT AND DELIVERY

- 6.1 (A) Primary Points of Receipt: The Primary Point(s) of Receipt at which Algonquin shall receive gas for transportation under this rate schedule shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Primary Point of Receipt the MDRO and receipt pressure obligations. Such exhibit by mutual written agreement may be superseded by a new exhibit which may add or delete specific points or make other changes thereto that the parties deem appropriate. Algonquin shall not accept any proposed Primary Point(s) of Receipt, or quantity at any Primary Point(s) of Receipt, or change in quantities among Primary Point(s) of Receipt if (a) the resulting aggregate MDROs at all of Customer's Primary Point(s) of Receipt would exceed Customer's MDTQ, or (b) in doing so, in Algonquin's reasonable judgment, Algonquin would impair its ability to satisfy its existing firm obligations to receive gas pursuant to other firm service agreements under which such Point(s) of Receipt are Primary Points of Receipt and to purchase and receive its Company Use Gas at maximum deliverability levels, as such Company Use Gas arrangements exist under agreements effective at the date of Customer's request or reasonably expected by Algonquin to be effective within six months of the request.
- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity

pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators for use as a Primary Point of Receipt in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Receipt to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In the event that Replacement Customer selects a new Primary Point of Receipt that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Receipt, shall revert to the Releasing Customer, and any Primary Points of Receipt granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.

- 6.2 Secondary Points of Receipt: Notwithstanding the foregoing, all interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt, with the exception of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, ~~or the Kleen Energy~~ Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, ~~and the interconnection between the Middletown Lateral and the Kleen Energy Lateral,~~ are available as Secondary Points of Receipt, and the interconnection between the West Roxbury Lateral and Algonquin's mainline under this Rate Schedule AFT-E. Such use of Secondary Points of Receipt is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.
- 6.3 (A) Primary Points of Delivery: The Primary Point(s) of Delivery at which Algonquin shall deliver gas for Customer's account under this rate schedule shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Point of Delivery the MDDO and delivery pressure obligations. Algonquin shall not

accept any proposed Primary Point(s) of Delivery, or quantity at any Primary Point(s) of Delivery, or change in quantities among Primary Point(s) of Delivery if the resulting aggregate MDDOs at all of Customer's Primary Point(s) of Delivery would exceed Customer's MDTQ except to the extent Customer's MDDOs reflect the conversion of pre-existing entitlements under firm sales agreements.

- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators for use as a Primary Point of Delivery in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Delivery to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In the event that Replacement Customer selects a new Primary Point of Delivery that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Delivery, shall revert to the Releasing Customer, and any Primary Points of Delivery granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.

- 6.4 Secondary Points of Delivery: Notwithstanding the foregoing, all interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery, with the exception of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, ~~or the Kleen Energy~~ Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, ~~and the~~ interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between

[the West Roxbury Lateral and Algonquin's mainline](#) are available as Secondary Points of Delivery under this Rate Schedule AFT-E. Such use of Secondary Points of Delivery is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.

7. INDEMNIFICATION

- 7.1 Customer acknowledges that as a result of Section 5 Orders issued to Customer's Upstream Entity or Notice Agent hereunder, Customer may incur imbalances between receipts and deliveries that will be cashed out at Month's end pursuant to Section 25 of the General Terms and Conditions of this tariff. Algonquin shall provide Customer with notice of an imbalance in a timely manner. Customer shall hold Algonquin harmless and indemnify Algonquin against any claim by Customer or otherwise arising out of the incurrence of imbalances as a result of Algonquin's issuance of Section 5 Orders.
- 7.2 Customer acknowledges that the exercise by Algonquin of its agency authority with respect to the Upstream Arrangements may cause the Upstream Entity to assess imbalance cash-out charges and transportation usage, storage injection, storage withdrawal or other charges against Customer. Customer shall hold Algonquin harmless and indemnify Algonquin against any liability whatsoever from any party whatsoever as a result of Algonquin's exercise of its agency authority with respect to the Upstream Arrangements hereunder.
- 7.3 Customer acknowledges that Notice Agent's execution of Section 5 Orders may cause upstream transporters or suppliers to assess charges against Customer for gas costs, transportation services, storage services, imbalance cash out or otherwise. Customer shall hold Algonquin harmless and indemnify Algonquin against any liability whatsoever from any party whatsoever as a result of Algonquin's issuance of Section 5 Orders to the Notice Agent, and the Notice Agent's performance or non-performance of its duties.
- 7.4 Notwithstanding the other provisions of this Section 7, Algonquin is not absolved from liability arising as a result of negligence on the part of Algonquin.

8. GENERAL TERMS AND CONDITIONS

The applicable General Terms and Conditions of this FERC Gas Tariff are hereby made a part of this rate schedule.

**RATE SCHEDULE AFT-1S**  
**FIRM TRANSPORTATION SERVICE**

1. **AVAILABILITY**

This rate schedule is available for firm transportation of natural gas by Algonquin Gas Transmission, LLC (hereinafter called "Algonquin") for any party (hereinafter called "Customer"), when:

- a. Customer's total MDTQ under all Algonquin firm rate schedules is 10,000 Dth or less per Day;
- b. Customer's sole source of transportation service deliveries is Algonquin;
- c. Customer has made a valid request for firm transportation pursuant to Section 2 of the General Terms and Conditions of this FERC Gas Tariff of which this rate schedule is a part;
- d. Sufficient firm capacity is available to effectuate such transportation without any construction of facilities or other investment by Algonquin, or Algonquin has waived this requirement in writing;
- e. The Primary Point(s) of Receipt and Primary Point(s) of Delivery requested by Customer are acceptable to Algonquin from the viewpoint of adequacy of Algonquin's existing facilities to receive and transport Customer's gas with Algonquin's existing firm service taking precedence; and
- f. Customer has executed a Service Agreement in the form contained in the FERC Gas Tariff of which this rate schedule is a part.
- g. Transportation service effectuated through capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, ~~or~~ the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL is not available under this rate schedule; provided, however that the interconnection between the Brayton Point Lateral and Algonquin's mainline (M&R No. 80035), the interconnection between the Manchester Street Lateral and Algonquin's mainline (M&R No. 80071), the interconnection between the Canal Lateral and Algonquin's mainline (M&R No. 8004), the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline (M&R No. 80095), ~~and~~ the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline (M&R No. 80104) are available under this Rate Schedule AFT-1S.

## 2. APPLICABILITY AND CHARACTER OF SERVICE

- 2.1 Transportation service hereunder will be on a firm basis except as provided herein and in Sections 16 and 24 of the General Terms and Conditions of this tariff. Algonquin shall receive from Customer, or for the account of Customer, at those points on Algonquin's system as specified in an executed AFT-1S Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Receipt") for transportation hereunder daily quantities of gas tendered for the account of Customer up to Customer's Maximum Daily Transportation Quantity ("MDTQ") plus an amount reflecting the Fuel Reimbursement Quantity as defined in Section 32 of the General Terms and Conditions of this tariff and, on a cumulative basis in any year, up to Customer's Maximum Annual Transportation Quantity ("MATQ") as specified in the service agreement, except as provided in Section 2.7 herein below, plus amounts reflecting the Fuel Reimbursement Quantity; provided however, Algonquin shall not be obligated to, but may at its option, receive at any Point(s) of Receipt on any Day a quantity of gas in excess of the applicable Maximum Daily Receipt Obligation ("MDRO") plus any applicable Fuel Reimbursement Quantity, provided that, if more than one Customer requests receipts in excess of its MDRO at a Point of Receipt, and the sum of all such requests exceeds the available capacity at such Point of Receipt, Algonquin shall apportion such receipts in excess of MDRO among such Customers pro rata according to the Customers' firm MDROs at the relevant Point of Receipt.
- 2.2 Upon receipt of such natural gas for Customer's account, Algonquin shall, after making allowance for the Fuel Reimbursement Quantity, transport and deliver hourly quantities of gas required by Customer up to Customer's Maximum Hourly Transportation Quantity ("MHTQ") at those points on Algonquin's system as are specified in an executed AFT-1S Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Delivery"); provided however, Algonquin shall not be obligated to, but may at its option, deliver at any Point(s) of Delivery an hourly quantity exceeding the MHTQ, and on any Day a quantity of gas in excess of the applicable Maximum Daily Delivery Obligation ("MDDO"), provided that, if more than one Customer requests deliveries in excess of its MDDO at a Point of Delivery, and the sum of all such requests exceeds the available capacity at such Point of Delivery, Algonquin shall apportion such deliveries in excess of MDDO among such Customers pro rata according to the Customers' firm MDDOs at the relevant Point of Delivery.
- 2.3 Provided such quantities have been scheduled in accordance with Section 23 of the General Terms and Conditions, Customer may tender quantities of gas in excess of the MDTQ plus any applicable Fuel Reimbursement Quantity on any Day if in Algonquin's reasonable judgment transportation of such gas can be accomplished by Algonquin without detriment to any other Customer under any of Algonquin's rate schedules. Such excess quantities shall be deemed to be Authorized Overrun Quantities.

- 2.4 A Customer executing a service agreement under this Rate Schedule AFT-1S has the right to make an election to convert its service in its entirety from firm transportation service under this rate schedule to firm transportation service under Rate Schedule AFT-1 by providing written notice of such election on or before June 1 of any year. As part of such conversion, such converting Customer has the right to reduce its MDTQ to be applicable under Rate Schedule AFT-1 upon such written notice of its election to convert. Such conversion and reduction shall be effective as of November 1 of that year.
- 2.5 Algonquin shall not be obligated to add any facilities or expand the capacity of Algonquin's pipeline system in any manner in order to provide transportation service to Customer pursuant to this rate schedule; provided, however, Algonquin may, at its option, and with Customer's consent, add facilities or expand capacity to provide such transportation service, subject to Section 42.
- 2.6 Unless otherwise specified in the applicable service agreement, service hereunder shall be available on any day of the year, subject to Customer's MATQ and MDTQ limitations.
- 2.7 With respect to existing service agreements resulting from the conversion pursuant to Order No. 636 of sales and storage service under former Rate Schedules F-1, WS-1, STB and SS-3, subject to Algonquin's firm service obligations from primary points of receipt to primary points of delivery Algonquin shall provide service above Customer's MATQ up to but not in excess of the highest MDTQ on which Customer's Reservation Charge during the currently effective term of the service agreement is based, specified in the executed service agreement multiplied by 365 (366 for a leap year) and, on any Day, Algonquin shall provide service above Customer's current MDTQ for a given season up to but not in excess of the highest MDTQ on which Customer's Reservation Charge during the currently effective term of the service agreement is based; provided, however, that such additional quantities shall be provided with the same priority for purposes of scheduling accorded to service meeting the criteria of Section 48.3(a)(1) of the General Terms and Conditions of this tariff only to the extent these quantities are requested to be scheduled from a receipt point located within the Base Flow Path to a delivery point located within the Base Flow Path, and provided further, that for purposes of Curtailment Customer's maximum daily entitlement shall be the highest MDTQ specified in Customer's executed service agreement during the period of Curtailment. Such additional quantities shall be subject to fuel, the applicable commodity rate and any applicable commodity surcharges.

### 3. RATE

- 3.1 Unit Rates. The applicable maximum and minimum unit rates are set forth in the currently effective Statement of Rates for Rate Schedule AFT-1S of this tariff and are hereby incorporated herein. Such rates are subject to adjustment pursuant to Section 33 and Section 34 of the General Terms and Conditions of this tariff.

The applicable unit rates to be charged on any Day by Algonquin for gas delivered to Customer shall not be in excess of the maximum unit rate nor less than the minimum unit rate.

3.2 Monthly Bill for Forwardhaul Rates. For Customers executing an AFT-1S Service Agreement for transportation which is not solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AFT-1S Service Agreement is effective and for each Month thereafter unless otherwise specified in the applicable Service Agreement, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:

- (a) Reservation Charge: The charge per Month per Dth of Customer's highest MDTQ during the Contract Year, as specified in Customer's executed AFT-1S Service Agreement; plus
- (b) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
- (c) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
- (d) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (e) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (f) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions; less
- (g) Revenue Credit: The revenue credit provided for in Section 41 of the General Terms and Conditions.

3.3 Monthly Bill for Backhaul Rates. For Customers executing an AFT-1S Service Agreement for transportation which is solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AFT-1S Service Agreement is effective and for each Month thereafter unless otherwise specified in the applicable Service Agreement, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:

- (a) Reservation Charge: The charge per Month per Dth of Customer's highest MDTQ during the Contract Year, as specified in Customer's executed AFT-1S Service Agreement; plus
- (b) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
- (c) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
- (d) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (e) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (f) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions; less
- (g) Revenue Credit: The revenue credit provided for in Section 41 of the General Terms and Conditions.

#### 4. NOMINATIONS AND SCHEDULING OF RECEIPTS AND DELIVERIES

- 4.1 Nominations and Scheduling. If Customer desires transportation of natural gas on any Day under this rate schedule, Customer shall provide a nomination to Algonquin in accordance with Section 22 of the General Terms and Conditions of this tariff. Based upon the nomination of Customer, Algonquin shall schedule receipts and deliveries of gas in accordance with the General Terms and Conditions. It is the responsibility of Customer to adjust its deliveries and receipts to conform to the scheduled quantities.
- 4.2 Delivery of Gas. Based upon the daily quantity scheduled, Algonquin shall make daily delivery of Customer's scheduled quantity taking into account the Fuel Reimbursement Quantity. It is the intention of Algonquin that daily deliveries of gas at the Point(s) of Delivery by Algonquin hereunder shall be as nearly equal as possible to daily receipts of gas at the Point(s) of Receipt by Algonquin for transportation hereunder, less the applicable Fuel Reimbursement Quantity. Any excess or deficiency in such receipts, less the applicable Fuel Reimbursement Quantity, and deliveries shall be resolved in accordance with the General Terms and Conditions of this tariff. Nothing in this rate schedule shall limit Algonquin's

right to take actions pursuant to Section 26 of the General Terms and Conditions of this tariff.

- 4.3 Commingling of Gas. From the time the natural gas is received by Algonquin at the Point(s) of Receipt, Algonquin shall have the unqualified right to commingle such natural gas with other gas in Algonquin's system.

5. OTHER OPERATING CONDITIONS

Algonquin's obligation to provide service under this rate schedule is subject to the following conditions being satisfied:

- 5.1 Customer shall make all necessary arrangements with other parties at or upstream of the Point(s) of Receipt where Customer tenders gas to Algonquin for transportation, and at or downstream of the Point(s) of Delivery where Algonquin delivers gas for Customer's account, and such arrangements must be compatible with Algonquin's system operations.
- 5.2 Algonquin shall schedule receipts at a Secondary Point of Receipt or deliveries at a Secondary Point of Delivery pursuant to the provisions of Sections 48.2 and 48.3 of the General Terms and Conditions.
- 5.3 To the extent that any upstream entity involved in handling Customer's gas refuses or is unable to deliver gas to Algonquin, Algonquin shall not be required to continue deliveries of gas on behalf of Customer. Prior to any reduction or interruption in service due to the failure of the upstream entity to deliver gas on behalf of Customer, Algonquin shall provide notice in a time and manner that is reasonable under then existing conditions. To the extent that any downstream entity involved in handling Customer's gas refuses or is unable to receive gas from Algonquin, Algonquin shall have the right to reduce deliveries of gas on behalf of Customer.
- 5.4 The daily quantities of natural gas transported shall be delivered at the Point(s) of Receipt at an hourly rate of 1/24th of the scheduled daily quantity. The daily quantities of natural gas transported shall be accepted at the Point(s) of Delivery at a substantially constant hourly rate or, in the case of service agreements resulting from the conversion pursuant to Order No. 636 of sales entitlements under former Rate Schedules F-1 and WS-1, at a rate no greater than .06 multiplied by the scheduled daily quantity.

6. POINT(S) OF RECEIPT AND DELIVERY

- 6.1 (A) Primary Points of Receipt: The Primary Point(s) of Receipt at which Algonquin shall receive gas for transportation under this rate schedule shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Primary Point of Receipt

the MDRO and receipt pressure obligations. Such exhibit by mutual written agreement may be superseded by a new exhibit which may add or delete specific points or make other changes thereto that the parties deem appropriate. Algonquin shall not accept any proposed Primary Point(s) of Receipt, or quantity at any Primary Point(s) of Receipt, or change in quantities among Primary Point(s) of Receipt if (a) the resulting aggregate MDROs at all of Customer's Primary Point(s) of Receipt would exceed Customer's MDTQ, or (b) in doing so, in Algonquin's reasonable judgment, Algonquin would impair its ability to satisfy its existing firm obligations to receive gas pursuant to other firm service agreements under which such Point(s) of Receipt are Primary Points of Receipt and to purchase and receive its Company Use Gas at maximum deliverability levels, as such Company Use Gas arrangements exist under agreements effective at the date of Customer's request or reasonably expected by Algonquin to be effective within six months of the request.

- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators for use as a Primary Point of Receipt in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Receipt to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In the event that Replacement Customer selects a new Primary Point of Receipt that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Receipt, shall revert to the Releasing Customer, and any Primary Points of Receipt granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.

- 6.2 Secondary Points of Receipt: Notwithstanding the foregoing, all interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt, with the exception of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2

Facility, ~~or~~ the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, ~~and~~ the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline are available as Secondary Points of Receipt under this Rate Schedule AFT-1S. Such use of Secondary Points of Receipt is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.

- 6.3 (A) Primary Points of Delivery: The Primary Point(s) of Delivery at which Algonquin shall deliver gas for Customer's account under this rate schedule shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Primary Point of Delivery the MDDO and delivery pressure obligations. Algonquin shall not accept any proposed Primary Point(s) of Delivery, or quantity at any Primary Point(s) of Delivery, or change in quantities among Primary Point(s) of Delivery if the resulting aggregate MDDOs at all of Customer's Primary Point(s) of Delivery would exceed Customer's MDTQ except to the extent Customer's MDDOs reflect the conversion of pre-existing entitlements under firm sales agreements.
- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators for use as a Primary Point of Delivery in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Delivery to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In the event that Replacement Customer selects a new Primary Point of Delivery that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Delivery, shall

revert to the Releasing Customer, and any Primary Points of Delivery granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.

- 6.4 Secondary Points of Delivery: Notwithstanding the foregoing, all interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery, with the exception of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, ~~or~~ the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, ~~and~~ the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline are available as Secondary Points of Delivery under this Rate Schedule AFT-1S. Such use of Secondary Points of Delivery is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.

## 7. GENERAL TERMS AND CONDITIONS

The applicable General Terms and Conditions of this FERC Gas Tariff are hereby made a part of this rate schedule.

**RATE SCHEDULE AFT-ES**  
**FIRM TRANSPORTATION SERVICE**

1. **AVAILABILITY**

This rate schedule is available for firm transportation of natural gas by Algonquin Gas Transmission, LLC (hereinafter called "Algonquin") for any party (hereinafter called "Customer"), when:

- a. Customer's total MDTQ under all Algonquin firm rate schedules is 10,000 Dth or less per Day;
- b. Customer's sole source of transportation service deliveries is Algonquin;
- c. Customer has made a valid request for firm transportation pursuant to Section 2 of the General Terms and Conditions of this FERC Gas Tariff of which this rate schedule is a part;
- d. Sufficient firm capacity is available to effectuate such transportation without any construction of facilities or other investment by Algonquin, or Algonquin has waived this requirement in writing;
- e. The Primary Point(s) of Receipt and Primary Point(s) of Delivery requested by Customer are acceptable to Algonquin from the viewpoint of adequacy of Algonquin's existing facilities to receive and transport Customer's gas with Algonquin's existing firm service taking precedence;
- f. Customer has contracted with one or more operators of upstream facilities that interconnect with the Algonquin system (the "Upstream Entity(ies)"), for a sufficient quantity of no-notice transportation services that encompass the right on the part of Customer to increase or decrease its receipts from the Upstream Entity(ies) into designated Points of Receipt on Algonquin's system with no advance notice, up to Customer's MDTQ under this Rate Schedule AFT-ES plus fuel as provided for in Section 32 of the General Terms and Conditions of this tariff in the case of increases in receipts, or down to zero in the case of decreases in receipts, without regard to any quantities that Customer previously scheduled on the Upstream Entity(ies), and with no requirement that Customer adhere to a constant rate of flow on the Upstream Entity(ies) (the "Upstream Arrangements");
- g. Customer has named a contact party (the "Notice Agent") for the receipt of orders issued in accordance with Section 5 ("Section 5 Orders") of this rate schedule;
- h. Customer has authorized Algonquin to exercise Customer's nomination and scheduling rights under the Upstream Arrangements, if necessary by executing agency instruments satisfactory to the Upstream Entity, to the extent required to permit service under this rate schedule; and

- i. Customer has executed a service agreement in the form contained in the FERC Gas Tariff of which this rate schedule is a part.
- j. Transportation service effectuated through capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, ~~or~~ the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL is not available under this rate schedule; provided, however that the interconnection between the Brayton Point Lateral and Algonquin's mainline (M&R No. 80035), the interconnection between the Manchester Street Lateral and Algonquin's mainline (M&R No. 80071), the interconnection between the Canal Lateral and Algonquin's mainline (M&R No. 8004), the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline (M&R No. 80095), ~~and~~ the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline (M&R No. 80104) are available under this Rate Schedule AFT-ES.

## 2. APPLICABILITY AND CHARACTER OF SERVICE

- 2.1 Transportation service hereunder will be on a firm basis except as provided herein and in Sections 16 and 24 of the General Terms and Conditions of this tariff. Algonquin shall receive from Customer, or for the account of Customer, at those points on Algonquin's system as specified in an executed AFT-ES Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Receipt") for transportation hereunder daily quantities of gas tendered for the account of Customer up to Customer's Maximum Daily Transportation Quantity ("MDTQ") plus an amount reflecting the Fuel Reimbursement Quantity as defined in Section 32 of the General Terms and Conditions of this tariff and, on a cumulative basis in any year, up to Customer's Maximum Annual Transportation Quantity ("MATQ") as specified in the service agreement, except as provided in Section 2.8 herein below, plus amounts reflecting the Fuel Reimbursement Quantity; provided however, Algonquin shall not be obligated to, but may at its option, receive at any Point(s) of Receipt on any Day a quantity of gas in excess of the applicable Maximum Daily Receipt Obligation ("MDRO") plus any applicable Fuel Reimbursement Quantity, provided that, if more than one Customer requests receipts in excess of its MDRO at a Point of Receipt, and the sum of all such requests exceeds the available capacity at such Point of Receipt, Algonquin shall apportion such receipts in excess of MDRO among such Customers pro rata according to the Customers' firm MDROs at the relevant Point of Receipt.
- 2.2 Upon receipt of such natural gas for Customer's account, Algonquin shall, after making allowance for the Fuel Reimbursement Quantity, transport and deliver hourly quantities of gas required by Customer up to Customer's Maximum Hourly

Transportation Quantity ("MHTQ") at those points on Algonquin's system as are specified in an executed AFT-ES Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Delivery"); provided however, Algonquin shall not be obligated to, but may at its option, deliver at any Point(s) of Delivery an hourly quantity exceeding the MHTQ, and on any Day a quantity of gas in excess of the applicable Maximum Daily Delivery Obligation ("MDDO"), provided that, if more than one Customer requests deliveries in excess of its MDDO at a Point of Delivery, and the sum of all such requests exceeds the available capacity at such Point of Delivery, Algonquin shall apportion such deliveries in excess of MDDO among such Customers pro rata according to the Customers' firm MDDOs at the relevant Point of Delivery.

- 2.3 Provided such quantities have been scheduled in accordance with Section 23 of the General Terms and Conditions, Customer may tender quantities of gas in excess of the MDTQ plus any applicable Fuel Reimbursement Quantity on any Day if in Algonquin's reasonable judgment transportation of such gas can be accomplished by Algonquin without detriment to any other Customer under any of Algonquin's rate schedules. Such excess quantities shall be deemed to be Authorized Overrun Quantities.
- 2.4 A Customer executing a service agreement under this Rate Schedule AFT-ES has the right to make an election to convert its service in its entirety from firm transportation service under this rate schedule to firm transportation service under Rate Schedule AFT-E or Rate Schedule AFT-1 by providing written notice of such election on or before June 1 of any year. As part of such conversion, such converting Customer has the right to reduce its MDTQ to be applicable under Rate Schedule AFT-E or Rate Schedule AFT-1 upon such written notice of its election to convert. Such conversion and reduction shall be effective as of November 1 of that year.
- 2.5 Algonquin shall not be obligated to add any facilities or expand the capacity of Algonquin's pipeline system in any manner in order to provide transportation service to Customer pursuant to this rate schedule; provided, however, Algonquin may, at its option, and with Customer's consent, add facilities or expand capacity to provide such transportation service, subject to Section 42.
- 2.6 Subject to the conditions specified in Section 5 of this Rate Schedule, service hereunder shall encompass the right on the part of Customer to increase deliveries at the Point(s) of Delivery up to the MDTQ and to decrease deliveries at the Point(s) of Delivery without advance notice to Algonquin and without Customer's previously having provided for a concurrent increase or decrease in receipts at the Point(s) of Receipt.
- 2.7 Unless otherwise specified in the applicable service agreement, service hereunder shall be available on any day of the year, subject to Customer's MATQ and MDTQ limitations.

- 2.8 With respect to existing service agreements resulting from the conversion pursuant to Order No. 636 of sales and storage service under former Rate Schedules F-1, WS-1, STB and SS-3, subject to Algonquin's firm service obligations from primary points of receipt to primary points of delivery Algonquin shall provide service above Customer's MATQ up to but not in excess of the highest MDTQ on which Customer's Reservation Charge during the currently effective term of the service agreement is based, specified in the executed service agreement multiplied by 365 (366 for a leap year) and, on any Day, Algonquin shall provide service above Customer's current MDTQ for a given season up to but not in excess of the highest MDTQ on which Customer's Reservation Charge during the currently effective term of the service agreement is based; provided, however, that such additional quantities shall be provided with the same priority for purposes of scheduling accorded to service meeting the criteria of Section 48.3(a)(1) of the General Terms and Conditions of this tariff only to the extent these quantities are requested to be scheduled from a receipt point located within the Base Flow Path to a delivery point located within the Base Flow Path, and provided further, that for purposes of Curtailment Customer's maximum daily entitlement shall be the highest MDTQ specified in Customer's executed service agreement during the period of Curtailment. Such additional quantities shall be subject to fuel, the applicable commodity rate and any applicable commodity surcharges.

### 3. RATE

- 3.1 Unit Rates. The applicable maximum and minimum unit rates are set forth in the currently effective Statement of Rates for Rate Schedule AFT-ES of this tariff and are hereby incorporated herein. Such rates are subject to adjustment pursuant to Section 33 and Section 34 of the General Terms and Conditions of this tariff. The applicable unit rates to be charged on any Day by Algonquin for gas delivered to Customer shall not be in excess of the maximum unit rate nor less than the minimum unit rate.
- 3.2 Monthly Bill for Forwardhaul Rates. For Customers executing an AFT-ES Service Agreement for transportation which is not solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AFT-ES Service Agreement is effective and for each Month thereafter unless otherwise specified in the applicable Service Agreement, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:
- (a) Reservation Charge: The charge per Month per Dth of Customer's highest MDTQ during the Contract Year, as specified in Customer's executed AFT-ES Service Agreement; plus

- (b) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
- (c) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
- (d) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (e) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (f) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions; less
- (g) Revenue Credit: The revenue credit provided for in Section 41 of the General Terms and Conditions.

3.3 Monthly Bill for Backhaul Rates. For Customers executing an AFT-ES Service Agreement for transportation which is solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AFT-ES Service Agreement is effective and for each Month thereafter unless otherwise specified in the applicable Service Agreement, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:

- (a) Reservation Charge: The charge per Month per Dth of Customer's highest MDTQ during the Contract Year, as specified in the applicable Service Agreement; plus
- (b) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
- (c) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
- (d) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus

- (e) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (f) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions; less
- (g) Revenue Credit: The revenue credit provided for in Section 41 of the General Terms and Conditions.

#### 4. NOMINATIONS AND SCHEDULING OF RECEIPTS AND DELIVERIES

- 4.1 Nominations and Scheduling. If Customer desires transportation of natural gas on any Day under this rate schedule, Customer shall provide a nomination to Algonquin in accordance with Section 22 of the General Terms and Conditions of this tariff. Based upon the nomination of Customer, Algonquin shall schedule receipts and deliveries of gas in accordance with the General Terms and Conditions. It is the responsibility of Customer to adjust its deliveries and receipts to conform to the scheduled quantities.
- 4.2 Delivery of Gas. Based upon the daily quantity scheduled and in accordance with Section 5 herein, Algonquin shall make daily delivery of Customer's scheduled quantity taking into account the Fuel Reimbursement Quantity. It is the intention of Algonquin that daily deliveries of gas at the Point(s) of Delivery by Algonquin hereunder shall be as nearly equal as possible to daily receipts of gas at the Point(s) of Receipt by Algonquin for transportation hereunder, less the applicable Fuel Reimbursement Quantity. Any excess or deficiency in such receipts, less the applicable Fuel Reimbursement Quantity, and deliveries shall be resolved in accordance with the General Terms and Conditions of this tariff. Nothing in this rate schedule shall limit Algonquin's right to take actions pursuant to Section 26 of the General Terms and Conditions of this tariff.
- 4.3 No-Notice Service. Notwithstanding the quantities nominated by Customer and scheduled by Algonquin hereunder, Customer shall be entitled to increase its deliveries up to the MDDO at any point, up to the MHTQ during any Hour, and up to the MDTQ, or to decrease its deliveries. Provided that all of the operational conditions specified in Section 5 of this rate schedule (the "Section 5 Conditions") are met, Algonquin shall consent to such increase or decrease in deliveries, thereby nullifying any daily scheduling or hourly scheduling penalty that would otherwise be applicable pursuant to Section 23 of the General Terms and Conditions. Furthermore, if the Section 5 Conditions are met, Algonquin will forbear from taking action pursuant to Section 26 of the General Terms and Conditions to reduce deliveries to Customer. If any of the Section 5 Conditions are not met, Algonquin shall not be required to receive or deliver gas in amounts other than the transportation quantities scheduled by Customer, and variations between scheduled quantities and actual deliveries to Customer's meter shall be subject to the

assessment of penalties pursuant to Section 23 of the General Terms and Conditions.

- 4.4 Commingling of Gas. From the time the natural gas is received by Algonquin at the Point(s) of Receipt, Algonquin shall have the unqualified right to commingle such natural gas with other gas in Algonquin's system.

5. OTHER OPERATING CONDITIONS

Algonquin's obligation to provide service under this rate schedule is subject to the following conditions being satisfied:

- 5.1 Customer shall make all necessary arrangements, including the Upstream Arrangements, with other parties at or upstream of the Point(s) of Receipt where Customer tenders gas to Algonquin for transportation, and at or downstream of the Point(s) of Delivery where Algonquin delivers gas for Customer's account, and such arrangements must be compatible with Algonquin's system operations.
- 5.2 Algonquin shall schedule receipts at a Secondary Point of Receipt or deliveries at a Secondary Point of Delivery pursuant to the provisions of Sections 48.2 and 48.3 of the General Terms and Conditions.
- 5.3 To the extent that any Upstream Entity involved in handling Customer's gas refuses or is unable to deliver gas to Algonquin, Algonquin shall not be required to continue deliveries of gas on behalf of Customer. Prior to any reduction or interruption in service due to the failure of the Upstream Entity to deliver gas on behalf of Customer, Algonquin shall provide notice in a time and manner that is reasonable under then existing conditions. To the extent that any downstream entity involved in handling Customer's gas refuses or is unable to receive gas from Algonquin, Algonquin shall have the right to reduce deliveries of gas on behalf of Customer.
- 5.4 The Upstream Arrangements must be in full force and effect; Customer shall not be in default of the Upstream Arrangements; and Customer's rights under the Upstream Arrangements shall be enforceable by Customer or its agents without impairment due to curtailment, force majeure or other reasons.
- 5.5 The Upstream Entity(ies) shall recognize Algonquin's rights as Customer's agent to issue orders ("Section 5 Orders") on Customer's behalf nominating or directing for Customer's account no-notice service as encompassed within the Upstream Arrangements at such levels and at such times as Algonquin determines in its reasonable discretion is required by the Algonquin system to meet the needs of Customer under this rate schedule.
- 5.6 All Upstream Entities involved in all Upstream Arrangements with Customer served under this rate schedule shall deliver to the various points of interconnection

between Algonquin's facilities and the facilities of the various Upstream Entities such quantities of gas at such times as Algonquin determines in its reasonable discretion are required by the Algonquin system to meet the needs of Customer under this rate schedule.

- 5.7 Customer's Notice Agent must have complete authority to call upon supplies for Customer's account at such times, in such quantities, and at such locations as Algonquin deems necessary, in its reasonable discretion, to enable Algonquin to provide service as contemplated for Customer under this rate schedule.
- 5.8 All Notice Agents named by Customer under this rate schedule shall execute Section 5 Orders at such locations and at such times as Algonquin determines in its reasonable discretion are necessary to enable Algonquin to provide service as contemplated under Rate Schedules AFT-ES and AFT-E.
- 5.9 The daily quantities of natural gas transported shall be delivered at the Point(s) of Receipt at an hourly rate of 1/24th of the scheduled daily quantity. The daily quantities of natural gas transported shall be accepted at the Point(s) of Delivery at a substantially constant hourly rate or, in the case of service agreements resulting from the conversion pursuant to Order No. 636 of sales entitlements under former Rate Schedules F-1 and WS-1, at an hourly rate no greater than .06 multiplied by the scheduled daily quantity.
- 5.10 In the event Customer has multiple upstream no-notice services pursuant to more than one contract, from more than one pipeline, or under more than one rate schedule, Customer shall provide Algonquin a predetermined order of preference for these upstream services. Algonquin shall follow this order of preference in scheduling Customer's upstream no-notice service. Customer may, upon twenty-four hours' written notice to Algonquin, modify this specification of scheduling preferences.
- 5.11 In the event Algonquin issues a Section 5 Order on Customer's behalf, Algonquin shall provide notice as soon as possible to Customer and Customer's Notice Agent by telephone or facsimile and by posting on its Internet Web Site that the Section 5 Order has been issued.

## 6. POINT(S) OF RECEIPT AND DELIVERY

- 6.1 (A) Primary Points of Receipt: The Primary Point(s) of Receipt at which Algonquin shall receive gas for transportation under this rate schedule shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Primary Point of Receipt the MDRO and receipt pressure obligations. Such exhibit by mutual written agreement may be superseded by a new exhibit which may add or delete specific points or make other changes thereto that the parties deem appropriate. Algonquin shall not accept any proposed Primary Point(s) of

Receipt, or quantity at any Primary Point(s) of Receipt, or change in quantities among Primary Point(s) of Receipt if (a) the resulting aggregate MDROs at all of Customer's Primary Point(s) of Receipt would exceed Customer's MDTQ, or (b) in doing so, in Algonquin's reasonable judgment, Algonquin would impair its ability to satisfy its existing firm obligations to receive gas pursuant to other firm service agreements under which such Point(s) of Receipt are Primary Points of Receipt and to purchase and receive its Company Use Gas at maximum deliverability levels, as such Company Use Gas arrangements exist under agreements effective at the date of Customer's request or reasonably expected by Algonquin to be effective within six months of the request.

- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators for use as a Primary Point of Receipt in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Receipt to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In the event that Replacement Customer selects a new Primary Point of Receipt that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Receipt, shall revert to the Releasing Customer, and any Primary Points of Receipt granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.

- 6.2 Secondary Points of Receipt: Notwithstanding the foregoing, all interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt, with the exception of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, the Kleen Energy Lateral, or the West Roxbury Lateral as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline,

the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, ~~and~~ the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline are available as Secondary Points of Receipt under this Rate Schedule AFT-ES. Such use of Secondary Points of Receipt is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.

- 6.3 (A) Primary Points of Delivery: The Primary Point(s) of Delivery at which Algonquin shall deliver gas for Customer's account under this rate schedule shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Primary Point of Delivery the MDDO and delivery pressure obligations. Algonquin shall not accept any proposed Primary Point(s) of Delivery, or quantity at any Point(s) of Delivery, or change in quantities among Primary Point(s) of Delivery if the resulting aggregate MDDOs at all of Customer's Primary Point(s) of Delivery would exceed Customer's MDTQ except to the extent Customer's MDDOs reflect the conversion of pre-existing entitlements under firm sales agreements.
- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators for use as a Primary Point of Delivery in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Delivery to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In the event that Replacement Customer selects a new Primary Point of Delivery that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Delivery, shall revert to the Releasing Customer, and any Primary Points of Delivery granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.

- 6.4 Secondary Points of Delivery: Notwithstanding the foregoing, all interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery, with the exception of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, ~~or~~ the Kleen Energy Lateral, or the West Roxbury Lateral as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, ~~and~~ the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline are available as Secondary Points of Delivery under this Rate Schedule AFT-ES. Such use of Secondary Points of Delivery is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.

## 7. INDEMNIFICATION

- 7.1 Customer acknowledges that as a result of Section 5 Orders issued to Customer's Upstream Entity or Notice Agent hereunder, Customer may incur imbalances between receipts and deliveries that will be cashed out at Month's end pursuant to Section 25 of the General Terms and Conditions of this tariff. Algonquin shall provide Customer with notice of an imbalance in a timely manner. Customer shall hold Algonquin harmless and indemnify Algonquin against any claim by Customer or otherwise arising out of the incurrence of imbalances as a result of Algonquin's issuance of Section 5 Orders.
- 7.2 Customer acknowledges that the exercise by Algonquin of its agency authority with respect to the Upstream Arrangements may cause the Upstream Entity to assess imbalance cash-out charges and transportation usage, storage injection, storage withdrawal or other charges against Customer. Customer shall hold Algonquin harmless and indemnify Algonquin against any liability whatsoever from any party whatsoever as a result of Algonquin's exercise of its agency authority with respect to the Upstream Arrangements hereunder.
- 7.3 Customer acknowledges that Notice Agent's execution of Section 5 Orders may cause upstream transporters or suppliers to assess charges against Customer for gas costs, transportation services, storage services, imbalance cash out or otherwise. Customer shall hold Algonquin harmless and indemnify Algonquin against any liability whatsoever from any party whatsoever as a result of Algonquin's issuance of Section 5 Orders to the Notice Agent, and the Notice Agent's performance or non-performance of its duties.

7.4 Notwithstanding the other provisions of this Section 7, Algonquin is not absolved from liability arising as a result of negligence on the part of Algonquin.

8. GENERAL TERMS AND CONDITIONS

The applicable General Terms and Conditions of this FERC Gas Tariff are hereby made a part of this rate schedule.

**RATE SCHEDULE AFT-CL**  
**FIRM TRANSPORTATION SERVICE**

1. **AVAILABILITY**

This rate schedule is available for firm transportation of natural gas by Algonquin Gas Transmission, LLC (hereinafter called "Algonquin") for any party (hereinafter called "Customer") on that portion of Algonquin's pipeline system known as (1) the Canal Lateral, which shall mean pipeline facilities including pipeline lateral facilities, meter station, and appurtenant facilities which extend from a point on Algonquin's existing mainline interstate natural gas pipeline system in Bourne, Massachusetts, along the north side of the Cape Cod Canal, under the Cape Cod Canal at or near the Bourne/Sandwich town line, and terminating at a point in the town of Sandwich in Barnstable County, Massachusetts, (2) the Middletown Lateral, which shall mean pipeline facilities including a pipeline lateral, meter station, and appurtenant facilities which will extend from a point on Algonquin's existing interstate natural gas pipeline system in Glastonbury, Connecticut to a point of interconnection, at the outlet side of the Middletown Meter Station, with facilities constructed by Connecticut Light and Power Company, (3) the Cleary Lateral, which shall mean pipeline facilities including a pipeline lateral, meter station, and appurtenant facilities which will extend from a point on Algonquin's existing interstate natural gas pipeline system in Berkley, Massachusetts, under the Taunton River to a point of interconnection, at the outlet side of the Cleary Meter Station, with facilities constructed by Taunton Municipal Lighting Plant, (4) the Lake Road Lateral, which shall mean pipeline facilities including a pipeline lateral, meter station, and appurtenant facilities which will extend from a point on Algonquin's existing interstate natural gas pipeline system in Windham County, Connecticut to a point of interconnection, at the outlet side of the Lake Road Meter Station, with facilities constructed by Lake Road Generating Co. LP, (5) the Brayton Point Lateral, which shall mean pipeline facilities including a pipeline lateral, meter station, and appurtenant facilities which will extend from a point on Algonquin's existing interstate natural gas pipeline system in Dighton, MA (M&R No. 80034) to a point of interconnection, at the outlet side of the Brayton Point Meter Station, with facilities owned by US Gen New England, Inc. (M&R No. 00090), (6) the Bellingham Lateral, which shall mean pipeline facilities including a pipeline lateral, meter station and appurtenant facilities which will extend from a point on Algonquin's existing interstate natural gas pipeline system in Norfolk County, Massachusetts to a point of interconnection, at the outlet side of the Bellingham Meter Station, with facilities constructed by ANP Bellingham Energy Company, (7) the Phelps Dodge Lateral, which shall mean pipeline facilities including a pipeline lateral, meter station and appurtenant facilities which will extend from a point on Algonquin's existing interstate natural gas pipeline system in New London County, Connecticut to a point of interconnection at the outlet side of the Phelps Dodge Meter Station, with facilities owned by Phelps Dodge Copper Products Company, (8) the Manchester Street Lateral, which shall mean pipeline facilities including a pipeline lateral, meter station and appurtenant facilities that extend from a point on Algonquin's existing interstate natural gas pipeline system at the head of the G-12 Lateral (M&R No. 80070) to a point of interconnection with facilities owned by USGen New England, Inc. at the outlet side of the Manchester Street power plant (M&R

No. 00087), (9) the Cape Cod Lateral, which shall mean pipeline facilities including a pipeline lateral, meter station and appurtenant facilities that extend from the terminus of Algonquin's Canal Lateral in the town of Sandwich in Barnstable County, Massachusetts, to a point of interconnection with facilities owned by Colonial Gas Company d/b/a KeySpan Energy Delivery New England in the town of Sandwich in Barnstable County, Massachusetts, (10) the Northeast Gateway Lateral, which shall mean pipeline facilities including a pipeline lateral and appurtenant facilities that extend from a point on Algonquin's existing HubLine offshore system in Massachusetts Bay, Massachusetts, to a point of interconnection with the offshore deepwater port facilities owned by Northeast Gateway Energy Bridge, L.L.C., (11) the J-2 Facility, which shall mean pipeline facilities including two parallel pipeline laterals, meter stations and appurtenant facilities that extend from a point on Algonquin's existing interstate natural gas pipeline system at the head of the J-2 Facility (M&R No. 80094) to a point of interconnection with facilities owned by The Boston Gas Company d/b/a National Grid downstream of the Mansfield Street Station (M&R No. 00070), ~~or~~ (12) the Kleen Energy Lateral, which shall mean pipeline facilities including a pipeline lateral, meter station and appurtenant facilities that extend from a point on Algonquin's existing Middletown Lateral in the City of Middletown, Connecticut, to a point of interconnection, at the outlet side of the Kleen Energy Meter Station (M&R No. 00833), with the Kleen Energy Power Plant facilities, or (13) the West Roxbury Lateral, which shall mean pipeline facilities including pipeline lateral facilities, meter station, and appurtenant facilities that extend from a point on Algonquin's existing mainline interstate natural gas pipeline system at the head of the West Roxbury Lateral (M&R No. 80104) in the Town of Westwood in Norfolk County, Massachusetts, to a point of interconnection, at the outlet side of the West Roxbury Meter Station, with facilities owned by the Boston Gas Company d/b/a National Grid (M&R No. 00838) when:

- a. Algonquin has placed the Canal Lateral, Middletown Lateral, Cleary Lateral, Lake Road Lateral, Brayton Point Lateral, Bellingham Lateral, Phelps Dodge Lateral, Manchester Street Lateral, Cape Cod Lateral, Northeast Gateway Lateral, J-2 Facility, ~~or~~ Kleen Energy Lateral, or West Roxbury Lateral, as applicable, in service;
- b. Customer has made a valid request for firm transportation pursuant to Section 2 of the General Terms and Conditions of this FERC Gas Tariff of which this rate schedule is a part;
- c. Sufficient firm capacity is available to effectuate such transportation without any construction of facilities or other investment by Algonquin, or Algonquin has waived this requirement in writing;
- d. The Primary Point(s) of Receipt and Primary Point(s) of Delivery requested by Customer are acceptable to Algonquin from the viewpoint of adequacy of Algonquin's existing facilities to receive and transport Customer's gas with Algonquin's existing firm service taking precedence; and

- e. Customer has executed a service agreement in the form contained in the FERC Gas Tariff of which this rate schedule is a part.

## 2. APPLICABILITY AND CHARACTER OF SERVICE

- 2.1 Transportation service hereunder will be on a firm basis except as provided herein and in Sections 16 and 24 of the General Terms and Conditions of this tariff. Algonquin shall receive from Customer, or for the account of Customer, at those points on Algonquin's system as specified in an executed AFT-CL Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Receipt") for transportation hereunder daily quantities of gas tendered for account of Customer up to Customer's Maximum Daily Transportation Quantity the ("MDTQ") and, on a cumulative basis in any year, up to Customer's Maximum Annual Transportation Quantity ("MATQ") as specified in the service agreement; provided, however, Algonquin shall not be obligated to, but may at its option, receive at any Point(s) of Receipt on any Day a quantity of gas in excess of the applicable Maximum Daily Receipt Obligation ("MDRO"), provided that, if more than one Customer requests receipts in excess of its MDRO at a Point of Receipt, and the sum of all such requests exceeds the available capacity at such Point of Receipt, Algonquin shall apportion such receipts in excess of MDRO among such Customers pro rata according to the Customers' firm MDROs at the relevant Point of Receipt.
- 2.2 Upon receipt of such natural gas for Customer's account, Algonquin shall transport and deliver hourly quantities of gas required by Customer up to Customer's MDTQ and, on a cumulative basis in any year, up to Customer's MATQ at those points on Algonquin's system as are specified in an executed AFT-CL Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Delivery"); provided, however, Algonquin shall not be obligated to, but may at its option, deliver at any Point(s) of Delivery a daily quantity exceeding the applicable Maximum Daily Delivery Obligation ("MDDO"), provided that, if more than one Customer requests deliveries in excess of its MDDO at a Point of Delivery, and the sum of all such requests exceeds the available capacity at such Point of Delivery, Algonquin shall apportion such deliveries in excess of MDDO among such Customers pro rata according to the Customers' firm MDDOs at the relevant Point of Delivery.
- 2.3 Provided such quantities have been scheduled in accordance with Section 23 of the General Terms and Conditions, Customer may tender quantities of gas in excess of the MDTQ on any Day if in Algonquin's reasonable judgment transportation of such gas can be accomplished by Algonquin without detriment to any other Customer under any of Algonquin's rate schedules. Such excess quantities shall be deemed to be Authorized Overrun Quantities.
- 2.4 Algonquin shall not be obligated to add any facilities or expand the capacity of Algonquin's pipeline system in any manner in order to provide transportation

service to Customer pursuant to this rate schedule; provided, however, Algonquin may, at its option, and with Customer's consent, add facilities or expand capacity to provide such transportation service, subject to Section 3 below.

- 2.5 Unless otherwise specified in the applicable Service Agreement, services hereunder shall be available on any day of the year, subject to Customer's MATQ and MDTQ limitations.

### 3. RATE

- 3.1 Unit Rates. The applicable maximum and minimum unit rates are set forth in the currently effective Statement of Rates for Rate Schedule AFT-CL of this tariff and are hereby incorporated herein. Such rates are subject to change under Sections 33 and 34 of the General Terms & Conditions as well as subject to the provisions of Section 4.3 of this rate schedule. The applicable unit rates to be charged on any Day by Algonquin for gas delivered to Customer shall not be in excess of the maximum unit rate nor less than the minimum unit rate.
- 3.2 Monthly Bill. Commencing for the Month in which the AFT-CL Service Agreement is effective, and for each Month thereafter unless otherwise specified in the applicable Service Agreement, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:
- (a) Reservation Charge: The charge per Month per Dth of Customer's MDTQ as specified in Customer's executed AFT-CL Service Agreement; plus
  - (b) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
  - (c) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
  - (d) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
  - (e) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
  - (f) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions; less

- (g) Revenue Credit: The revenue credit provided for in Section 41 of the General Terms and Conditions.

3.3 Customer Reimbursement. Customer shall, in addition to the charges referenced above, reimburse Algonquin for the following:

- (a) The costs of any facilities installed by Algonquin with Customer's consent to receive, measure, transport or deliver natural gas for the account of Customer; and
- (b) Any and all filing and approval fees required in connection with Customer's service agreement that Algonquin is obligated to pay to the FERC or any other governmental authority having jurisdiction.

Any reimbursement due Algonquin by Customer pursuant to this Section 3.3 shall be due and payable to Algonquin within ten days of the date of Algonquin's invoice(s) for same.

4. NOMINATIONS AND SCHEDULING OF RECEIPTS AND DELIVERIES

- 4.1 Nominations and Scheduling. If Customer desires transportation of natural gas on any Day under this rate schedule, Customer shall provide a nomination to Algonquin in accordance with Section 22 of the General Terms and Conditions of this tariff. Based upon the nomination of Customer, Algonquin shall schedule receipts and deliveries of gas in accordance with the General Terms and Conditions. It is the responsibility of Customer to adjust its deliveries and receipts to conform to the scheduled quantities.

- 4.2 Delivery of Gas. Based upon the daily quantity scheduled, Algonquin shall make daily delivery of Customer's scheduled quantity. It is the intention of Algonquin that daily deliveries of gas at the Point(s) of Delivery by Algonquin hereunder shall be as nearly equal as possible to daily receipts of gas at the Point(s) of Receipt by Algonquin for transportation hereunder. Any excess or deficiency in such receipts and deliveries shall be resolved in accordance with the General Terms and Conditions of this tariff. Nothing in this rate schedule shall limit Algonquin's right to take actions pursuant to Section 26 of the General Terms and Conditions of this tariff.

- 4.3 Responsibility for Imbalances. Any imbalance resulting from transportation pursuant to this rate schedule on the Canal Lateral, Middletown Lateral, Cleary Lateral, Lake Road Lateral, Brayton Point Lateral, Bellingham Lateral, Phelps Dodge Lateral, Manchester Street Lateral, Cape Cod Lateral, Northeast Gateway Lateral, J-2 Facility, ~~or~~ Kleen Energy Lateral, or West Roxbury Lateral, as applicable, shall be accounted for under the upstream transportation agreement(s) pursuant to which such gas was delivered to the inlet of the Canal Lateral, Middletown Lateral, Cleary Lateral, Lake Road Lateral, Brayton Point Lateral,

Bellingham Lateral, Phelps Dodge Lateral, Manchester Street Lateral, Cape Cod Lateral, Northeast Gateway Lateral, J-2 Facility, ~~or~~ Kleen Energy Lateral, or West Roxbury Lateral, as applicable. No imbalance resolution charges, unauthorized overrun penalties, or scheduling penalties shall be assessed under this rate schedule to the extent that Algonquin has assessed any such charges or penalties under another agreement with respect to the same gas or transaction.

- 4.4 Commingling of Gas. From the time the natural gas is received by Algonquin at the Point(s) of Receipt, Algonquin shall have the unqualified right to commingle such natural gas with other gas in Algonquin's system.

5. OTHER OPERATING CONDITIONS

Algonquin's obligation to provide service under this rate schedule is subject to the following conditions being satisfied:

- 5.1 Customer shall make all necessary arrangements with other parties at or upstream of the Point(s) of Receipt where Customer tenders gas to Algonquin for transportation, and at or downstream of the Point(s) of Delivery where Algonquin delivers gas for Customer's account, and such arrangements must be compatible with Algonquin's system operations.
- 5.2 Algonquin shall schedule receipts at a Secondary Point of Receipt or deliveries at a Secondary Point of Delivery pursuant to the provisions of Sections 48.2 and 48.3 of the General Terms and Conditions.
- 5.3 To the extent that any upstream entity involved in handling Customer's gas (other than Algonquin) refuses or is unable to deliver gas to Algonquin, Algonquin shall not be required to continue deliveries of gas on behalf of Customer. Prior to any reduction or interruption in service due to the failure of the upstream entity to deliver gas on behalf of Customer, Algonquin shall provide notice in a time and manner that is reasonable under then existing conditions. To the extent that any downstream entity involved in handling Customer's gas refuses or is unable to receive gas from Algonquin, Algonquin shall have the right to reduce deliveries of gas on behalf of Customer.

6. POINT(S) OF RECEIPT AND DELIVERY

- 6.1 (A) Primary Points of Receipt: The Primary Point(s) of Receipt at which Algonquin shall receive gas for transportation under this rate schedule shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Primary Point of Receipt the MDRO and receipt pressure obligations. Such exhibit by mutual written agreement may be superseded by a new exhibit which may add or delete specific points or make other changes thereto that the parties deem appropriate. Algonquin shall not accept any proposed Primary Point(s) of

Receipt, or quantity at any Primary Point(s) of Receipt, or change in quantities among Primary Point(s) of Receipt if (a) the resulting aggregate MDROs at all of Customer's Primary Point(s) of Receipt would exceed Customer's MDTQ, or (b) in doing so, in Algonquin's reasonable judgment, Algonquin would impair its ability to satisfy its existing firm obligations to receive gas pursuant to other firm service agreements under which such Point(s) of Receipt are Primary Points of Receipt and to purchase and receive its Company Use Gas at maximum deliverability levels, as such Company Use Gas arrangements exist under agreements effective at the date of Customer's request or reasonably expected by Algonquin to be effective within six months of the request.

- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators on the designated AFT-CL lateral for use as a Primary Point of Receipt in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Receipt to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment to the Primary Points of Receipt under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In addition, a Replacement Customer may choose only those primary points along the lateral segment on which it contracts for transportation service under the replacement contract, as those lateral segments are set forth in the description of Secondary Points in Section 6.2 below. In the event that Replacement Customer selects a new Primary Point of Receipt that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Receipt, shall revert to the Releasing Customer, and any Primary Points of Receipt granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.

- 6.2 Secondary Points of Receipt: Notwithstanding the foregoing, all interconnections between the Canal Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the Canal Lateral, all interconnections between the Middletown Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the Middletown Lateral,

all interconnections between the Cleary Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the Cleary Lateral, all interconnections between the Lake Road Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the Lake Road Lateral, all interconnections between the Brayton Point Lateral facilities of Algonquin and the facilities of other operators including, but not limited to, the tap on the Algonquin G-1 System in Dighton, MA (M&R No. 80034) shall be available for use by Customer as Secondary Points of Receipt for service on the Brayton Point Lateral, all interconnections between the Bellingham Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the Bellingham Lateral, all interconnections between the Phelps Dodge Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the Phelps Dodge Lateral, all interconnections between the Manchester Street Lateral facilities of Algonquin and the facilities of other operators, including, but not limited to, the head of the G-12 Lateral (M&R No. 80070), shall be available for use by Customer as Secondary Points of Receipt for service on the Manchester Street Lateral, all interconnections between the Cape Cod Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the Cape Cod Lateral, all interconnections between the Northeast Gateway Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the Northeast Gateway Lateral, all interconnections between the J-2 Facility of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the J-2 Facility, ~~and~~ all interconnections between the Kleen Energy Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the Kleen Energy Lateral, and all interconnections between the West Roxbury Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the West Roxbury Lateral. Such use of Secondary Points of Receipt is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.

- 6.3 (A) Primary Points of Delivery: The Primary Point(s) of Delivery at which Algonquin shall deliver gas for Customer's account under this rate schedule shall be specified in an exhibit to the service agreement executed by Algonquin and Customer. Such exhibit shall specify for each Point of Delivery the MDDO and delivery pressure obligations. Algonquin shall not accept any proposed Primary Point(s) of Delivery, or quantity at any Primary Point(s) of Delivery, or change in quantities among Primary Point(s) of Delivery if the resulting aggregate Primary Point(s) of Delivery if the resulting aggregate MDDOs at all of Customer's Primary Point(s) of Delivery would exceed Customer's MDTQ except to the extent Customer's

MDDOs reflect the conversion of pre-existing entitlements under firm sales agreements.

- (B) A Replacement Customer that acquired capacity pursuant to the capacity release mechanism set forth in Section 14 of the General Terms and Conditions of this tariff or a releasing Customer that has released capacity pursuant to the capacity release mechanism set forth in Section 14 of the GT&C of this tariff may request, subject to the availability of point and path capacity, any interconnection between the facilities of Algonquin and the facilities of other operators on the designated AFT-CL lateral for use as a Primary Point of Delivery in a segmented transaction, provided, however, that Algonquin shall not accept any proposed Primary Point of Delivery to the extent that (a) the resulting aggregate contractual entitlements under the related releasing and replacement contracts along any segment would exceed the MDTQ of the original contract, or (b) the quantities transported along any segment to the Primary Points of Delivery under the resulting aggregate related releasing and replacement contracts would exceed the MDTQ of the original contract. In addition, a Replacement Customer may choose only those primary points along the lateral segment on which it contracts for transportation service under the replacement contract, as those lateral segments are set forth in the description of Secondary Points in Section 6.4 below. In the event that Replacement Customer selects a new Primary Point of Delivery that is located within the acquired contract path, the portion of the path no longer covered by that contract is deemed to be unsubscribed capacity that may be sold by Algonquin for the term of the capacity release agreement. Upon termination of the capacity release agreement, all capacity covered by the original release, including the original Primary Points of Delivery, shall revert to the Releasing Customer, and any Primary Points of Delivery granted during the term of the capacity release agreement shall revert to Algonquin as unsubscribed capacity.

- 6.4 Secondary Points of Delivery: Notwithstanding the foregoing, all interconnections between the Canal Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the Canal Lateral, all interconnections between the Middletown facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the Middletown Lateral, all interconnections between the Cleary Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the Cleary Lateral, all interconnections between the Lake Road Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the Lake Road Lateral, all interconnections between the Brayton Point Lateral facilities of Algonquin and the facilities of other operators including, but not limited to, the tap on the Algonquin G-1 System in Dighton, MA (M&R 80034) shall be available for use by Customer as Secondary Points of Delivery for service

on the Brayton Point Lateral, all interconnections between the Bellingham Lateral facilities of Algonquin and facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the Bellingham Lateral, all interconnections between the Phelps Dodge Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the Phelps Dodge Lateral, all interconnections between the Manchester Street Lateral facilities of Algonquin and the facilities of other operators, including, but not limited to, the head of the G-12 Lateral (M&R No. 80070), shall be available for use by Customer as Secondary Points of Delivery for service on the Manchester Street Lateral, all interconnections between the Cape Cod Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the Cape Cod Lateral, all interconnections between the Northeast Gateway Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the Northeast Gateway Lateral, all interconnections between the J-2 Facility of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Receipt for service on the J-2 Facility, ~~and~~ all interconnections between the Kleen Energy Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the Kleen Energy Lateral, and all interconnections between the West Roxbury Lateral facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Secondary Points of Delivery for service on the West Roxbury Lateral. Such use of Secondary Points of Delivery is subject to and pursuant to Section 48.2 of the General Terms and Conditions of this FERC Gas Tariff.

7. GENERAL TERMS AND CONDITIONS

The applicable General Terms and Conditions of this FERC Gas Tariff are hereby made a part of this rate schedule.

**RATE SCHEDULE AIT-1**  
**INTERRUPTIBLE TRANSPORTATION SERVICE**

1. AVAILABILITY

This rate schedule is available for interruptible transportation of natural gas by Algonquin Gas Transmission, LLC (hereinafter called "Algonquin") for any party (hereinafter called "Customer"), when:

- a. Customer has made a valid request for interruptible transportation pursuant to Section 2 of the General Terms and Conditions of this FERC Gas Tariff of which this rate schedule is a part; and
- b. Customer has executed a service agreement in the form contained in the FERC Gas Tariff of which this rate schedule is a part.
- c. Transportation service effectuated through capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, ~~or~~ the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL is not available under this rate schedule; provided, however that the interconnection between the Brayton Point Lateral and Algonquin's mainline (M&R No. 80035), the interconnection between the Manchester Street Lateral and Algonquin's mainline (M&R No. 80071), the interconnection between the Canal Lateral and Algonquin's mainline (M&R No. 8004), the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline (M&R No. 80095), ~~and~~ the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline (M&R No. 80104) are available under this Rate Schedule AIT-1.

2. APPLICABILITY AND CHARACTER OF SERVICE

- 2.1 Transportation service hereunder will be on an interruptible basis. Algonquin shall receive from Customer, or for the account of Customer, at those points on Algonquin's system as specified in an executed AIT-1 Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Receipt") for transportation hereunder daily quantities of gas tendered for the account of Customer up to Customer's Maximum Daily Transportation Quantity ("MDTQ") plus an amount reflecting the Fuel Reimbursement Quantity as defined in Section 32 of the General Terms and Conditions of this tariff and, on a cumulative basis in any year, up to Customer's Maximum Annual Transportation Quantity ("MATQ") as specified in the service agreement plus amounts reflecting the Fuel Reimbursement Quantity.

- 2.2 Upon receipt of such natural gas for Customer's account, Algonquin shall, after making allowance for the Fuel Reimbursement Quantity, transport and deliver hourly quantities of gas required by Customer up to Customer's Maximum Hourly Transportation Quantity ("MHTQ") at those points on Algonquin's system as are specified in an executed AIT-1 Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Delivery"), provided, however, Algonquin shall not be obligated to, but may at its option, deliver at any Point(s) of Delivery an hourly quantity exceeding the MHTQ.
- 2.3 Provided such quantities have been scheduled in accordance with Section 23 of the General Terms and Conditions, Customer may tender quantities of gas in excess of the MDTQ plus any applicable Fuel Reimbursement Quantity on any Day if in Algonquin's reasonable judgment transportation of such gas can be accomplished by Algonquin without detriment to any other Customer under any of Algonquin's rate schedules. Such excess quantities shall be deemed to be Authorized Overrun Quantities.
- 2.4 Algonquin shall not be obligated to add any facilities or expand the capacity of Algonquin's pipeline system in any manner in order to provide transportation service to Customer pursuant to this rate schedule; provided, however, Algonquin may, at its option, and with Customer's consent, add facilities or expand capacity to provide such transportation service, subject to Section 42.

### 3. RATE

- 3.1 Unit Rates. The applicable maximum and minimum unit rates are set forth in the currently effective Statement of Rates for Rate Schedule AIT-1 of this FERC Gas Tariff and are hereby incorporated herein. Such rates are subject to adjustment pursuant to Section 33 and Section 34 of the General Terms and Conditions of this tariff. The applicable unit rates to be charged on any Day by Algonquin for gas delivered to Customer shall not be in excess of the maximum unit rate nor less than the minimum unit rate.
- 3.2 Monthly Bill for Forwardhaul Rates. For Customers executing an AIT-1 Service Agreement for transportation which is not solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AIT-I Service Agreement is effective and for each Month thereafter, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:
- (a) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus

- (b) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
- (c) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (d) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (e) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions.

3.3 Monthly Bill for Backhaul Rates. For Customers executing an AIT-1 Service Agreement for transportation which is solely a Backhaul transportation arrangement as defined in Section 1 of the General Terms and Conditions, and commencing for the Month in which the AIT-1 Service Agreement is effective and for each Month thereafter, Algonquin shall charge and Customer shall pay Algonquin the sum of the following amounts:

- (a) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month under this rate schedule (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
- (b) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus
- (c) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (d) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (e) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions.

#### 4. NOMINATIONS AND SCHEDULING OF RECEIPTS AND DELIVERIES

4.1 Nominations and Scheduling. If Customer desires transportation of natural gas on any Day under this rate schedule, Customer shall provide a nomination to Algonquin in accordance with Section 22 of the General Terms and Conditions of

this tariff. Based upon the nomination of Customer, Algonquin shall schedule receipts and deliveries of gas in accordance with the General Terms and Conditions. It is the responsibility of Customer to adjust its deliveries and receipts to conform to the scheduled quantities.

- 4.2 Delivery of Gas. Based upon the daily quantity scheduled, Algonquin shall make daily delivery of Customer's scheduled quantity taking into account the Fuel Reimbursement Quantity. It is the intention of Algonquin that daily deliveries of gas at the Point(s) of Delivery by Algonquin hereunder shall be as nearly equal as possible to daily receipts of gas at the Point(s) of Receipt by Algonquin for transportation hereunder, less the applicable Fuel Reimbursement Quantity. Any excess or deficiency in such receipts, less the applicable Fuel Reimbursement Quantity, and deliveries shall be resolved in accordance with the General Terms and Conditions. Nothing in this rate schedule shall limit Algonquin's right to take actions pursuant to Section 26 of the General Terms and Conditions of this tariff.
- 4.3 Commingling of Gas. From the time the natural gas is received by Algonquin at the Point(s) of Receipt, Algonquin shall have the unqualified right to commingle such natural gas with other gas in Algonquin's system.

5. OTHER OPERATING CONDITIONS

Algonquin's obligation to provide service under this rate schedule is subject to the following conditions being satisfied:

- 5.1 Customer shall make all necessary arrangements with other parties at or upstream of the Point(s) of Receipt where Customer tenders gas to Algonquin for transportation, and at or downstream of the Point(s) of Delivery where Algonquin delivers gas for Customer's account, and such arrangements must be compatible with Algonquin's system operations.
- 5.2 To the extent that any upstream entity involved in handling Customer's gas refuses or is unable to deliver gas to Algonquin, Algonquin shall not be required to continue deliveries of gas on behalf of Customer. To the extent that any downstream entity involved in handling Customer's gas refuses or is unable to receive gas from Algonquin, Algonquin shall have the right to reduce deliveries of gas on behalf of Customer.
- 5.3 The daily quantities of natural gas transported shall be delivered at the Point(s) of Receipt and accepted at the Point(s) of Delivery at a substantially constant hourly rate, or such other hourly rate as may be acceptable to Algonquin.

6. POINT(S) OF RECEIPT AND DELIVERY

- 6.1 All interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Point(s) of Receipt, with the

exception of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, ~~or~~ the Kleen Energy [Lateral, or the West Roxbury Lateral](#), as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, ~~and~~ the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline are available as Points of Receipt under this Rate Schedule AIT-1.

- 6.2 All interconnections between the facilities of Algonquin and the facilities of other operators shall be available for use by Customer as Point(s) of Delivery, with the exception of interconnections with the facilities of other operators accessible only through the utilization of capacity on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, ~~or~~ the Kleen Energy [Lateral, or the West Roxbury Lateral](#), as such lateral facilities are defined in Rate Schedule AFT-CL; provided, however, that the interconnection between the Brayton Point Lateral and Algonquin's mainline, the interconnection between the Manchester Street Lateral and Algonquin's mainline, the interconnection between the Canal Lateral and Algonquin's mainline, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts, the interconnection between the J-2 Facility and Algonquin's mainline, ~~and~~ the interconnection between the Middletown Lateral and the Kleen Energy Lateral, and the interconnection between the West Roxbury Lateral and Algonquin's mainline are available as Points of Delivery under this Rate Schedule AIT-1.

## 7. GENERAL TERMS AND CONDITIONS

The applicable General Terms and Conditions of this FERC Gas Tariff are hereby made a part of this rate schedule.

**RATE SCHEDULE AIT-2**  
**INTERRUPTIBLE TRANSPORTATION SERVICE**

1. **AVAILABILITY**

This rate schedule is available for interruptible transportation of natural gas by Algonquin Gas Transmission, LLC (hereinafter called "Algonquin") for any party (hereinafter called "Customer") on the Brayton Point Lateral, on the Manchester Street Lateral, on the Canal Lateral, on the Cape Cod Lateral, on the Northeast Gateway Lateral, on the J-2 Facility, ~~or~~ on the Kleen Energy Lateral, or on the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL, when:

- a. Customer has made a valid request for interruptible transportation pursuant to Section 2 of the General Terms and Conditions of this FERC Gas Tariff of which this rate schedule is a part; and
- b. Customer has executed a service agreement in the form contained in the FERC Gas Tariff of which this rate schedule is a part; and
- c. Customer's service agreement specifies that either the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, ~~or~~ the Kleen Energy Lateral, or the West Roxbury Lateral, as such lateral facilities are defined in Rate Schedule AFT-CL, shall be utilized to effectuate service hereunder.

2. **APPLICABILITY AND CHARACTER OF SERVICE**

- 2.1 Transportation service hereunder will be on an interruptible basis. Algonquin shall receive from Customer, or for the account of Customer, at those points on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, ~~or~~ the Kleen Energy Lateral, or the West Roxbury Lateral, as specified in Customer's executed AIT-2 Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Receipt") for transportation hereunder daily quantities of gas tendered for the account of Customer up to Customer's Maximum Daily Transportation Quantity ("MDTQ") plus an amount reflecting the Fuel Reimbursement Quantity, if applicable, as defined in Section 32 of the General Terms and Conditions of this tariff and, on a cumulative basis in any year, up to Customer's Maximum Annual Transportation Quantity ("MATQ") as specified in the service agreement plus amounts reflecting the Fuel Reimbursement Quantity, if applicable.
- 2.2 Upon receipt of such natural gas for Customer's account, Algonquin shall, after making allowance for the Fuel Reimbursement Quantity, if applicable, transport and deliver hourly quantities of gas required by Customer up to Customer's Maximum Hourly Transportation Quantity ("MHTQ") at those points on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape

Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, ~~or~~ the Kleen Energy Lateral, or the West Roxbury Lateral, as specified in Customer's executed AIT-2 Service Agreement between Customer and Algonquin (hereinafter referred to as "Point(s) of Delivery"), provided, however, Algonquin shall not be obligated to, but may at its option, deliver at any Point(s) of Delivery an hourly quantity exceeding the MHTQ.

- 2.3 Provided such quantities have been scheduled in accordance with Section 23 of the General Terms and Conditions, Customer may tender quantities of gas in excess of the MDTQ plus any applicable Fuel Reimbursement Quantity on any Day if in Algonquin's reasonable judgment transportation of such gas can be accomplished by Algonquin without detriment to any other Customer under any of Algonquin's rate schedules. Such excess quantities shall be deemed to be Authorized Overrun Quantities.
- 2.4 Algonquin shall not be obligated to add any facilities or expand the capacity of Algonquin's pipeline system in any manner in order to provide transportation service to Customer pursuant to this rate schedule; provided, however, Algonquin may, at its option, and with Customer's consent, add facilities or expand capacity to provide such transportation service, subject to Section 42 of the General Terms and Conditions of this tariff.

### 3. RATE

- 3.1 Unit Rates. The applicable maximum and minimum unit rates are set forth in the currently effective Statement of Rates for Rate Schedule AIT-2 of this FERC Gas Tariff and are hereby incorporated herein. Such rates are subject to adjustment pursuant to Section 33 and Section 34 of the General Terms and Conditions of this tariff. The applicable unit rates to be charged on any Day by Algonquin for gas delivered to Customer shall not be in excess of the maximum unit rate nor less than the minimum unit rate, except as provided in Section 46 of the General Terms and Conditions of Algonquin's FERC Gas Tariff.
- 3.2 Monthly Bill. Commencing for the Month in which the AIT-2 Service Agreement is effective and for each Month thereafter, Algonquin shall charge Customer and Customer shall pay Algonquin the sum of the following amounts:
- (a) Commodity Charge: The applicable commodity rate multiplied by the quantity of gas delivered in the Month (excluding Authorized Overrun Quantities) at the Point(s) of Delivery; plus
  - (b) Authorized Overrun Charge: The applicable authorized overrun charge per Dth of Authorized Overrun Quantity delivered to Customer for the Month under this rate schedule; plus

- (c) Imbalance Resolution Charges: The applicable imbalance resolution charges assessed pursuant to Section 25 of the General Terms and Conditions; plus
- (d) Scheduling Penalties: The applicable scheduling penalties assessed pursuant to Section 23 of the General Terms and Conditions; plus
- (e) Unauthorized Contract Overrun Penalties: The applicable unauthorized contract overrun penalties assessed pursuant to Section 31 of the General Terms and Conditions.

4. NOMINATIONS AND SCHEDULING OF RECEIPTS AND DELIVERIES

- 4.1 Nominations and Scheduling. If Customer desires transportation of natural gas on any Day under this rate schedule, Customer shall provide a nomination to Algonquin in accordance with Section 22 of the General Terms and Conditions of this tariff. Based upon the nomination of Customer, Algonquin shall schedule receipts and deliveries of gas in accordance with the General Terms and Conditions. It is the responsibility of Customer to adjust its deliveries and receipts to conform to the scheduled quantities.
- 4.2 Delivery of Gas. Based upon the daily quantity scheduled, Algonquin shall make daily delivery of Customer's scheduled quantity taking into account the Fuel Reimbursement Quantity. It is the intention of Algonquin that daily deliveries of gas at the Point(s) of Delivery by Algonquin hereunder shall be as nearly equal as possible to daily receipts of gas at the Point(s) of Receipt by Algonquin for transportation hereunder, less the applicable Fuel Reimbursement Quantity. Any excess or deficiency in such receipts, less the applicable Fuel Reimbursement Quantity, and deliveries shall be resolved in accordance with the General Terms and Conditions. Nothing in this rate schedule shall limit Algonquin's right to take actions pursuant to Section 26 of the General Terms and Conditions of this tariff.
- 4.3 Responsibility for Imbalances. Any imbalance resulting from transportation transactions pursuant to this rate schedule on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, ~~or~~ the Kleen Energy Lateral, or the West Roxbury Lateral, as specified on Customer's AIT-2 Service Agreement for which natural gas was received under an upstream transportation agreement(s) on Algonquin's system shall be accounted for under the upstream transportation agreement(s). No imbalance resolution charges, unauthorized overrun penalties, or scheduling penalties shall be assessed under this rate schedule for such transactions to the extent that Algonquin has assessed any such charges or penalties under the upstream transportation agreement(s) with respect to the same gas or transactions.

- 4.4 Commingling of Gas. From the time the natural gas is received by Algonquin at the Point(s) of Receipt, Algonquin shall have the unqualified right to commingle such natural gas with other gas in Algonquin's system.

5. OTHER OPERATING CONDITIONS

Algonquin's obligation to provide service under this rate schedule is subject to the following conditions being satisfied:

- 5.1 Customer shall make all necessary arrangements with Algonquin or other parties, as applicable, at or upstream of the Point(s) of Receipt where Customer tenders gas to Algonquin for transportation, and at or downstream of the Point(s) of Delivery where Algonquin delivers gas for Customer's account, and such arrangements must be compatible with Algonquin's system operations.
- 5.2 To the extent that any upstream entity involved in handling Customer's gas refuses or is unable to deliver gas to Algonquin, Algonquin shall not be required to continue deliveries of gas on behalf of Customer. To the extent that any downstream entity involved in handling Customer's gas refuses or is unable to receive gas from Algonquin, Algonquin shall have the right to reduce deliveries of gas on behalf of Customer.
- 5.3 The daily quantities of natural gas transported shall be delivered at the Point(s) of Receipt and accepted at the Point(s) of Delivery at a substantially constant hourly rate, or such other hourly rate as may be acceptable to Algonquin.

6. POINT(S) OF RECEIPT AND DELIVERY

- 6.1 All interconnections between the Brayton Point Lateral facilities, including, but not limited to, the tap on Algonquin's G-1 System in Dighton, MA (M&R No. 80034); the Manchester Street Lateral facilities, including, but not limited to the head of the G-12 Lateral (M&R No. 80070); the Canal Lateral facilities, including, but not limited to, the interconnection between the Canal Lateral and Algonquin's mainline; the Cape Cod Lateral facilities, including, but not limited to, the interconnection between the Cape Cod Lateral and the Canal Lateral; the Northeast Gateway Lateral facilities, including, but not limited to, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts; the J-2 Facility, including, but not limited to the head of the J-2 Facility (M&R No. 80094); ~~or~~ the Kleen Energy Lateral facilities, including, but not limited to, the interconnection between the Kleen Energy Lateral and the Middletown Lateral; or the West Roxbury Lateral facilities, including, but not limited to, the interconnection between the West Roxbury Lateral and Algonquin's mainline, as specified in Customer's executed AIT-2 Service Agreement, and the facilities of other operators shall be available for use by Customer as Point(s) of Receipt.

- 6.2 All interconnections between the Brayton Point Lateral facilities, including, but not limited to, the tap on Algonquin's G-1 System in Dighton, MA (M&R No. 80034); the Manchester Street Lateral facilities, including, but not limited to the head of the G-12 Lateral (M&R No. 80070); the Canal Lateral facilities, including, but not limited to, the interconnection between the Canal Lateral and Algonquin's mainline; the Cape Cod Lateral facilities, including, but not limited to, the interconnection between the Cape Cod Lateral and the Canal Lateral; the Northeast Gateway Lateral facilities, including, but not limited to, the interconnection between the Northeast Gateway Lateral and the HubLine offshore system in Massachusetts Bay, Massachusetts; the J-2 Facility, including, but not limited to the head of the J-2 Facility (M&R No. 80094); ~~or~~ the Kleen Energy Lateral facilities, including, but not limited to, the interconnection between the Kleen Energy Lateral and the Middletown Lateral; or the West Roxbury Lateral facilities, including, but not limited to, the interconnection between the West Roxbury Lateral and Algonquin's mainline, as specified in Customer's executed AIT-2 Service Agreement, and the facilities of other operators shall be available for use by Customer as Point(s) of Delivery.

7. GENERAL TERMS AND CONDITIONS

The applicable General Terms and Conditions of this FERC Gas Tariff are hereby made a part of this rate schedule.

## 41. REVENUE CREDITS

### 41.1 Interruptible Transportation and Park and Loan Service

- (a) Applicability. The credit available under this Section 41.1 for revenues under Rate Schedules AIT-1 and PAL shall apply to all Service Agreements under firm Part 284 transportation service rate schedules, except for Service Agreements for service on the Brayton Point Lateral, the Manchester Street Lateral, the Canal Lateral, the Cape Cod Lateral, the Northeast Gateway Lateral, the J-2 Facility, ~~and~~ the Kleen Energy Lateral, and the West Roxbury Lateral under Rate Schedule AFT-CL. The credit available under this Section 41 for revenues under Rate Schedule AIT-2 attributable to service on the Brayton Point Lateral shall apply only to Service Agreements for service on the Brayton Point Lateral under Rate Schedule AFT-CL. The credit available under this Section 41 for revenues under Rate Schedule AIT-2 attributable to service on the Manchester Street Lateral shall apply only to Service Agreements for service on the Manchester Street Lateral under Rate Schedule AFT-CL. The credit available under this Section 41 for revenues under Rate Schedule AIT-2 attributable to service on the Canal Lateral shall apply only to Service Agreements for service on the Canal Lateral under Rate Schedule AFT-CL. The credit available under this Section 41 for revenues under Rate Schedule AIT-2 attributable to service on the Cape Cod Lateral shall apply only to Service Agreements for service on the Cape Cod Lateral under Rate Schedule AFT-CL. The credit available under this Section 41 for revenues under Rate Schedule AIT-2 attributable to service on the Northeast Gateway Lateral shall apply only to Service Agreements for service on the Northeast Gateway Lateral under Rate Schedule AFT-CL. The credit available under this Section 41 for revenues under Rate Schedule AIT-2 attributable to service on the J-2 Facility shall apply only to Service Agreements for service on the J-2 Facility under Rate Schedule AFT-CL. The credit available under this Section 41 for revenues under Rate Schedule AIT-2 attributable to service on the Kleen Energy Lateral shall apply only to Service Agreements for service on the Kleen Energy Lateral under Rate Schedule AFT-CL.
- (b) Basis of the Credit. Revenues to which the credit under this Section 41.1 shall apply ("Eligible Revenues") shall be the revenues actually received by Algonquin under Rate Schedules AIT-1 and PAL or Rate Schedule AIT-2 (for interruptible services that have not been allocated cost of service) that are attributable to commodity charges and authorized overrun charges but not including imbalance resolution charges, scheduling penalties, unauthorized contract overrun penalties, GRI, ACA, revenues attributable to Section 8 of Rate Schedule PAL, or any other such charges or surcharges.

(c) Percentage of Eligible Revenues.

- (i) Rate Schedules AIT-1 and PAL. Beginning with the Month following the Month in which Algonquin's cumulative annual revenues stemming from commodity charges and authorized overrun charges under Rate Schedules AIT-1 and PAL exceed the dollar amount allocated to Rate Schedules AIT-1 and PAL in Algonquin's currently effective rates ("Excess Eligible Revenues"), Algonquin shall credit to current Month invoices under the applicable rate schedules 90% of the Excess Eligible Revenues received during the prior Month. For purposes of determining cumulative annual revenues under Rate Schedules AIT-1 and PAL, the annual period shall commence on May 1 of each year. In the event that two or more maximum rates for service under Rate Schedules AIT-1 and PAL are applicable during the same twelve month period beginning on May 1, the threshold for revenue crediting hereunder shall consist of a time-weighted average of the amounts allocated to Rate Schedules AIT-1 and PAL during the periods when the various AIT-1 and PAL rates are in effect. Algonquin shall retain the remainder of the Eligible Revenues and Excess Eligible Revenues not required to be credited or refunded.
- (ii) Rate Schedule AIT-2. Beginning with the Month following the Month in which Algonquin's cumulative annual revenues stemming from commodity charges and authorized overrun charges under Rate Schedule AIT-2 exceed the dollar amount allocated to Rate Schedule AIT-2 in Algonquin's currently effective rates ("Excess Eligible Revenues"), if any, Algonquin shall credit to current Month invoices under the applicable rate schedules 50% of the Excess Eligible Revenues received during the prior Month. For purposes of determining cumulative annual revenues under Rate Schedule AIT-2, the annual period shall commence on May 1 of each year. In the event that two or more maximum rates for service under Rate Schedule AIT-2 are applicable during the same twelve month period beginning on May 1, the threshold for revenue crediting hereunder shall consist of a time-weighted average of the amounts allocated to Rate Schedule AIT-2 during the periods when the various AIT-2 rates are in effect. Algonquin shall retain the remainder of the Eligible Revenues and Excess Eligible Revenues not required to be credited or refunded.
- (d) Apportionment of Eligible Revenues. Eligible Revenues attributable to a Month shall be apportioned among all Customers under the applicable rate schedules by applying the following ratio for each Customer: (a) the Customer's total MDTQ in effect during that Month under the applicable rate schedules (b) divided by the summation of the total MDTQs in effect

during that Month for all Customers under the applicable rate schedules; provided, however, that no Customer shall receive a credit under this Section 41.1 in excess of its reservation charges under the applicable rate schedules for that Month, with such excess being reallocated to the other Customers under the applicable rate schedule in accordance with the above ratios.

- (e) Credits Subject to Refund. In the event that any revenues credited pursuant to Section 41.1 are subject to refund, and are ultimately required to be refunded to Customers under Rate Schedules AIT-1 and PAL or Rate Schedule AIT-2, Algonquin shall recalculate the revenue credits that would have been due to Customer if the AIT-1 and PAL rates or AIT-2 rate, respectively, used for purposes of the refund computation had been in effect at the time of the required credit, and shall bill Customer for the differences between revenues actually credited, and the recalculated revenue credit, plus interest at the rate prescribed by the Commission's regulations.

#### 41.2 Retained Upstream Capacity Release Credits.

- (a) Applicability. The credit available under this Section 41.2 shall apply to all firm rate schedules except Rate Schedule AFT-CL.
- (b) Basis of the Credit. Revenues to which the credit under this Section 41.2 shall apply ("Eligible Capacity Release Revenues") shall be the revenues actually received by Algonquin that are attributable to demand charges paid by parties to which Algonquin has released upstream capacity rights held by Algonquin, to the extent that the costs of such rights have been reflected in the rates paid by Customers under the rate schedules identified in Section 41.2(a).
- (c) Apportionment of Eligible Capacity Release Revenues. Eligible Revenues attributable to a Month shall be apportioned among all Customers under the applicable rate schedules by applying the following ratio for each Customer: (i) the Customer's total MDTQ in effect during that Month under the applicable rate schedules, (ii) divided by the summation of the total MDTQs in effect during that Month for all Customers under the applicable rate schedules, provided that, in the case of a Customer paying less than the maximum reservation charge during any Month, the Customer's MDTQ for purposes of both (i) and (ii) above shall be reduced in the same proportion as the reservation charge paid bears to the maximum reservation charge.

**FORM OF SERVICE AGREEMENT  
(APPLICABLE TO RATE SCHEDULE AFT-CL)**

Date: \_\_\_\_\_,

Contract No. \_\_\_\_\_

**SERVICE AGREEMENT**

This AGREEMENT is entered into by and between Algonquin Gas Transmission, LLC, ("Algonquin") and \_\_\_\_\_ ("Customer").

WHEREAS, [this and an additional clause(s) may be included to describe the historical or factual context of the Agreement, to describe or identify a precedent agreement, and any other agreements if applicable, between Algonquin and Customer related to the Agreement, and/or to describe or define the facilities necessary to provide service under the Agreement, and will not include binding consideration.]

***[In the event that the capacity was awarded as Interim Capacity pursuant to Section 2.6 of the General Terms and Conditions of the Algonquin Tariff, the following language will be included as a Whereas clause in Customer's Agreement: "The service provided to Customer under this Agreement will utilize capacity that was acquired by Customer as Interim Capacity pursuant to the provisions of Section 2.6 of the General Terms and Conditions of the Algonquin Tariff."]***

NOW THEREFORE, in consideration of the premises and of the mutual covenants herein contained, the parties do agree as follows:

1. Algonquin shall deliver and Customer shall take and pay for service on Algonquin's [Canal Lateral, Middletown Lateral, Cleary Lateral, Lake Road Lateral, Brayton Point Lateral, Bellingham Lateral, Phelps Dodge Lateral, Manchester Street Lateral, Cape Cod Lateral, Northeast Gateway Lateral, J-2 Facility, ~~or~~ Kleen Energy Lateral, or West Roxbury Lateral, as applicable,] pursuant to the terms of this Agreement and subject to Algonquin's Rate Schedule AFT-CL and the General Terms and Conditions of Algonquin's Tariff, which are incorporated herein by reference and made a part hereof.

***[In the event that a precedent agreement for a new or an expansion project contains credit provisions applicable to Customer's capacity related to such project, the following language shall be included in Customer's Service Agreement. "The credit requirements applicable to this Agreement are set forth in that certain Precedent Agreement dated \_\_\_\_\_ between Algonquin and Customer related to this Agreement."]***

2. The Maximum Daily Transportation Quantity (MDTQ) and Maximum Annual Transportation Quantity (MATQ) for service under this Agreement and any right to increase or decrease the MDTQ or MATQ during the term of this Agreement are listed on Exhibit C attached hereto. The Point(s) of Receipt and Point(s) of Delivery, respectively, are listed on Exhibits A and B attached hereto. Exhibit(s) A, B, and C are incorporated herein by reference and made a part hereof.
3. This Agreement shall be effective on \_\_\_\_\_ [this blank may include a date certain, a date either earlier or later than a specified date certain based on the completion of construction of facilities necessary to provide service under the Agreement, a date set forth in or established by a relevant order from the Federal Energy Regulatory Commission or a commencement date as defined in a precedent agreement between Customer and Algonquin] and shall continue for a term ending on and including \_\_\_\_\_ [or, when applicable, "shall continue for a term of \_\_\_\_\_ years"] ("Primary Term") and shall continue to be effective from \_\_\_\_\_ to \_\_\_\_\_ thereafter ***[In the event that the capacity was awarded as Interim Capacity pursuant to Section 2.6 of the General Terms and Conditions of the Algonquin Tariff, the following phrase will be included in Customer's Agreement: "but in no event beyond \_\_\_\_\_,"]*** unless and until terminated by Algonquin or Customer upon prior written notice of at

least \_\_\_\_\_ [not less than 1 year for agreements with a primary term of more than 1 year; for service agreements with both a primary term and notice period of exactly one (1) year, the notice must be submitted within ten (10) Business Days of the beginning of the primary term of the service agreement, and at least one (1) year for subsequent notices for such service agreement; and otherwise mutually agreeable]. [In the event that Algonquin and Customer agree to a fixed term, the evergreen and notice of termination language shall be omitted from Customer's Agreement.] This Agreement may be terminated at any time by Algonquin in the event Customer fails to pay part or all of the amount of any bill for service hereunder and such failure continues for thirty days after payment is due; provided Algonquin gives ten days prior written notice to Customer of such termination and provided further such termination shall not be effective if, prior to the date of termination, Customer either pays such outstanding bill or furnishes a good and sufficient surety bond or other form of security reasonably acceptable to Algonquin guaranteeing payment to Algonquin of such outstanding bill; provided that Algonquin shall not be entitled to terminate service pending the resolution of a disputed bill if Customer complies with the billing dispute procedure currently on file in Algonquin's Tariff. Any portions of this Agreement necessary to correct or cash-out imbalances under this Agreement as required by the General Terms and Conditions of Algonquin's Tariff shall survive the other parts of this Agreement until such time as such balancing has been accomplished.

If this Agreement qualifies as a "ROFR Agreement" as defined in the General Terms and Conditions of Algonquin's Tariff, the provision of a termination notice by either Customer or Algonquin, pursuant to the preceding paragraph, a notice of partial reduction in Maximum Daily Transportation Quantity and Maximum Annual Transportation Quantity pursuant to Exhibit C or the expiration of this Agreement of its own terms triggers Customer's right of first refusal under Section 9 of the General Terms and Conditions of Algonquin's Tariff.

***[In the event that the capacity was awarded as Interim Capacity pursuant to Section 2.6 of the General Terms and Conditions of the Algonquin Tariff, the previous paragraph will be replaced with the following language: "This Agreement does not qualify as a ROFR Agreement, as such term is defined in Section 1 of the General Terms and Conditions of the Algonquin Tariff."]***

4. Maximum rates, charges, and fees shall be applicable to service pursuant to this Agreement except during the specified term of a discounted rate or a Negotiated Rate to which Customer and Algonquin have agreed. Provisions governing such discounted rate shall be as specified in the Discount Confirmation to this Agreement. Provisions governing such Negotiated Rate and term shall be as specified on an appropriate Statement of Negotiated Rates filed, with the consent of Customer, as part of Algonquin's Tariff. It is further agreed that Algonquin may seek authorization from the Commission and/or other appropriate body at any time and from time to time to change any rates, charges or other provisions in the applicable Rate Schedule and General Terms and Conditions of Algonquin's Tariff, and Algonquin shall have the right to place such changes in effect in accordance with the Natural Gas Act. Nothing contained herein shall be construed to deny Customer any rights it may have under the Natural Gas Act, including the right to participate fully in rate or other proceedings by intervention or otherwise to contest increased rates in whole or in part.
5. Unless otherwise required in the Tariff, all notices shall be in writing and shall be considered duly delivered when mailed to the applicable address below or transmitted via facsimile. Customer or Algonquin may change the addresses or other information below by written notice to the other without the necessity of amending this Agreement:

Algonquin:

Customer:

6. The interpretation and performance of this Agreement shall be in accordance with the laws of the Commonwealth of Massachusetts, excluding conflicts of law principles that would require the application of the laws of a different jurisdiction.
7. This Agreement supersedes and cancels, as of the effective date of this Agreement, the contract(s) between the parties hereto as described below, if applicable:

[None or an appropriate description]

Open Season Notices

## Algonquin Incremental Market (AIM) Project

Connecting emerging natural gas supplies to premium markets in the Northeast and New England

**Open Season Notice for Firm Service**  
December 13, 2010 – February 11, 2011

J.A. - 0322

## Algonquin Incremental Market (AIM) Project

AIM offers the unique opportunity for moving emerging natural gas supplies to premium markets in the Northeast and New England.

Spectra Energy's Algonquin Gas Transmission, LLC ("Algonquin"), a leading provider of natural gas transportation to the Northeast and New England, is proposing a system expansion to deliver natural gas from both existing supply sources and the emerging Marcellus shale gas to premium Northeast and New England markets. This Open Season is seeking market interest in receipt and delivery alternatives resulting from the need to connect growing gas supplies in the Appalachian basin to the expanding Northeast and New England markets.

### Project Background

The Northeast and New England gas supply dynamics are shifting, with a decline in traditional Canadian imports and a dramatic increase in Appalachian gas, including the Marcellus shale play. Connecting growing markets to new supply has been beneficial to Algonquin's shippers for many years.

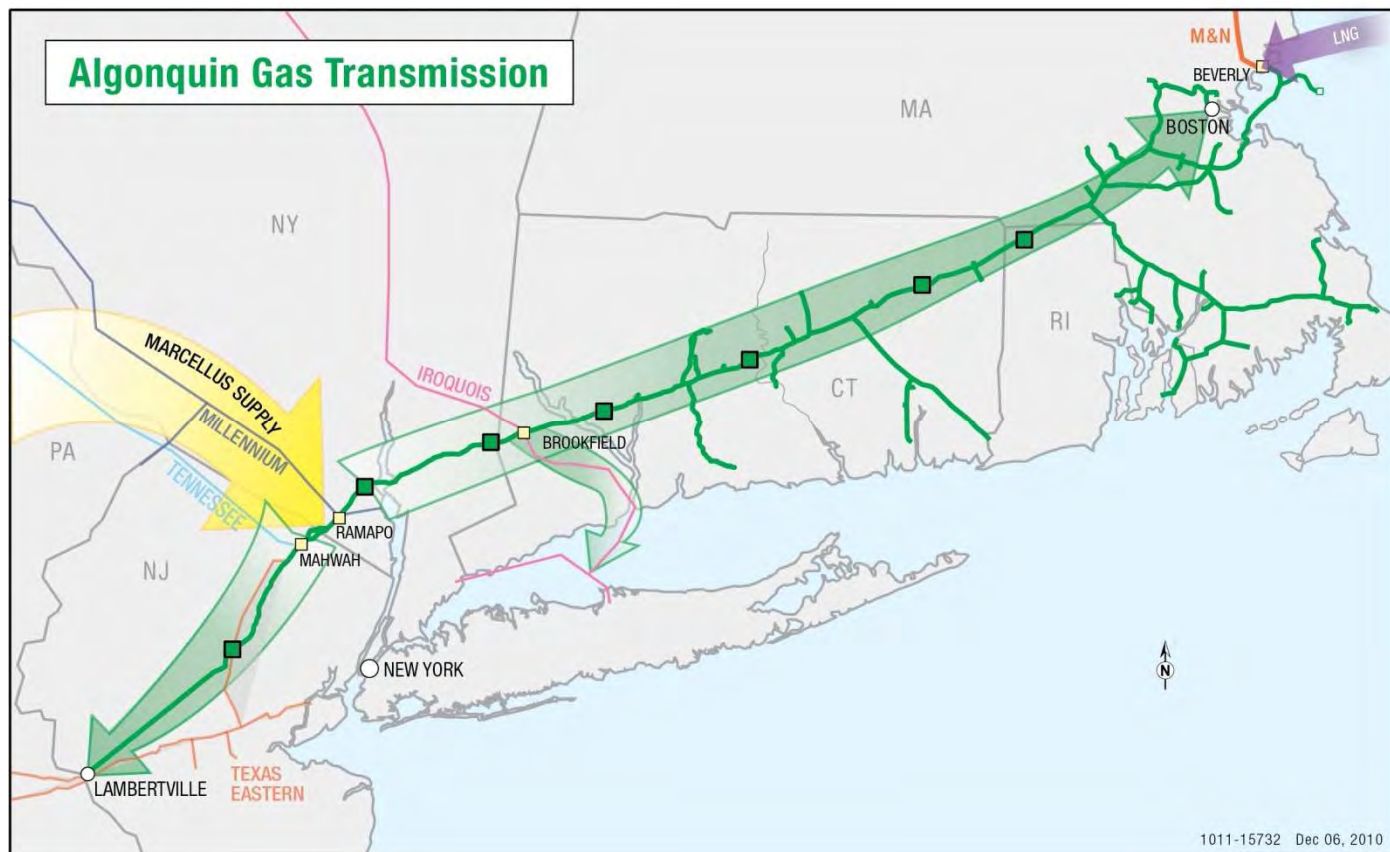

This expansion will offer growing Northeast and New England markets increased supply diversity, enhanced ability to better manage price volatility, improved supply security and reliability. The Algonquin system offers attractive market options for these developing supply sources, including access to conventional Northeast and New England distribution utility market growth, increasing natural gas power generation, and

interconnects with downstream pipelines that provide direct access to additional markets.

Algonquin has the proven ability and experience to develop and execute AIM as evidenced by the numerous projects Algonquin has put into service. Through the utilization of its existing mainline infrastructure, plus incremental expansion as necessary, Algonquin will facilitate the cost-effective transportation of these new supplies to the Northeast and New England markets. In addition, Algonquin will maximize the use of existing rights-of-way in order to minimize the impact on landowners and the environment as well as to keep the construction costs as low as possible.

### Project Description

AIM provides shippers with the opportunity to design transportation services from multiple receipt points on the Algonquin system including, but not limited to, Lambertville, Ramapo, Mahwah and Beverly to multiple existing and proposed delivery points including Lambertville, Brookfield and numerous other market points. Shippers may also request to increase the capacity at the Algonquin interconnect at Brookfield, providing incremental gas deliveries into the Iroquois Gas Transmission system via a compression-only service which Algonquin would propose to offer,

subject to any necessary approvals to provide such service.

Algonquin may develop smaller, targeted projects from the nominations received that may be more representative of the timing and markets served. Algonquin anticipates that AIM will have a target in-service date of November 2014.

### Project Rates

Rates will be determined at the conclusion of the Open Season and are dependent upon the scope and final facilities required to satisfy the firm service requests for shippers who are awarded capacity and who have executed binding precedent agreements. Shippers will have the ability to choose to pay Algonquin's applicable recourse rates for service on the AIM facilities or to pay a mutually agreeable negotiated rate for such service plus any applicable fuel and applicable charges and surcharges. Algonquin may consider favorable rate or rate-related incentives to anchor shippers who are willing to both commit early and provide the commercial foundation for the AIM project.

### Nomination Process

During the Open Season period (9:00 a.m., EST, Monday, December 13, 2010, to 5:00 p.m., EST, on Friday, February 11, 2011), interested parties must submit a Service Request Form, which specifies the Maximum Daily Transportation Quantity (MDTQ), contract term (15-year minimum required), and desired primary receipt and delivery points. The Service Request Form is included in this package. The completed Service Request Form must be executed by a duly authorized representative and mailed, faxed, or emailed to [gncrisp@spectraenergy.com](mailto:gncrisp@spectraenergy.com) in pdf format to Algonquin's offices at: 5400 Westheimer Court, Houston, TX 77056  
Attention: Greg Crisp, Project Director  
The fax number is (713) 627-4727.  
Algonquin reserves the right to reject any Service Request Form that is not received on or before 5:00 p.m. EST, on February 11, 2011.

### Contracting for Service

Upon the close of the Open Season, a representative will contact you to discuss your service requirements. Requesting parties will then have the option to proceed with negotiations on a definitive agreement. All definitive transactions will be subject to the receipt of

all necessary governmental approvals and permits in order to render the proposed services and to construct the proposed facilities.

### Limitations and Reservations

Algonquin reserves the right, in its sole discretion, to decline to proceed with the AIM project. Algonquin also reserves the right to proceed with one or more projects that will be defined through the contracting process and reserves the right to negotiate with only those parties that submit bids with this AIM open season.

Algonquin also reserves the right to reject any and all bids that do not satisfy the requirements set forth in this Non-binding Open Season Notice. Without limiting the foregoing, Algonquin may, but is not required to, reject any request for service in which the Non-binding Service Request Form is incomplete, is inconsistent with the terms and conditions outlined in this Non-binding Open Season Notice, contains additional or modified terms, or is otherwise deficient in any respect. Algonquin also reserves the right to reject requests for service in the event requesting parties are unable to meet applicable creditworthiness requirements. No request for service shall be binding on Algonquin unless and until duly authorized representatives of both a requesting party and Algonquin have executed a binding precedent agreement.

### Communications

At any time during the Open Season, interested parties are encouraged to contact their Algonquin account manager or Greg Crisp at (713) 627-4611 to discuss any questions or to seek additional information.

Spectra Energy Corp (NYSE: SE), a *FORTUNE 500* company, is one of North America's premier natural gas infrastructure companies serving three key links in the natural gas value chain: gathering and processing, transmission and storage, and distribution. For nearly a century, Spectra Energy and its predecessor companies have developed critically important pipelines and related infrastructure connecting natural gas supply sources to premium markets. Based in Houston, Texas, the company operates in the United States and Canada approximately 19,100 miles of transmission pipeline, more than 305 billion cubic feet of storage, as well as natural gas gathering and processing, natural gas liquids operations and local distribution assets. The company also has a 50 percent ownership in DCP Midstream, one of the largest natural gas gatherers and processors in the United States. Spectra Energy is a member of both the Dow Jones Sustainability World Index and the U.S. S&P 500 Carbon Disclosure Project's Leadership Index. For more information, visit [www.spectraenergy.com](http://www.spectraenergy.com).

## Algonquin Incremental Market (AIM) Project

*Securing New England's energy future by providing access to domestic, clean, and abundant supplies of natural gas*

### Open Season Notice for Firm Service

September 20, 2012 – November 2, 2012

## Algonquin Incremental Market (AIM) Project

*Securing New England's energy future by providing access to domestic, clean, and abundant supplies of natural gas*

Spectra Energy's Algonquin Gas Transmission, LLC ("Algonquin"), a leading provider of natural gas transportation to the Northeast and New England, is proposing an expansion of its existing system to meet growing New England demand with abundant natural gas supplies from regional supply sources. In this Open Season, Algonquin invites parties interested in obtaining AIM capacity to submit a firm service request form. Algonquin has recently executed an agreement with a shipper in support of the development of the AIM Project that qualifies the shipper for Anchor Shipper status. The service commencement date for this project is targeted for November 1, 2016.

### Project Background

Natural gas demand in New England is growing rapidly as natural gas is becoming the fuel of choice for home heating and electric power generation. Converting home heating units from oil to natural gas represents a substantial source of growth in the region, as less than 50% of homes currently use natural gas for home heating. Likewise, ISO New England reports that electric energy production from natural gas has grown from 15% in 2000 to 52% in 2011, almost completely displacing oil and substantially replacing coal. New England will need additional natural gas pipeline infrastructure to reliably meet increased demands from home heating and electric generation. While demand is increasing, regional production is also becoming increasingly available to the Algonquin system and more production is expected to enter Algonquin in the coming years. These additional supplies are a natural fit for meeting the natural gas demand needs of the region. The AIM Project is an infrastructure investment that would increase pipeline capacity and allow abundant supplies from regional production to flow to the New England LDC and power generation markets. A study conducted by Concentric Energy Advisors concluded that New England natural gas and electric customers could realize from \$240 to \$310 million annually in direct savings as a result of additional natural gas infrastructure.

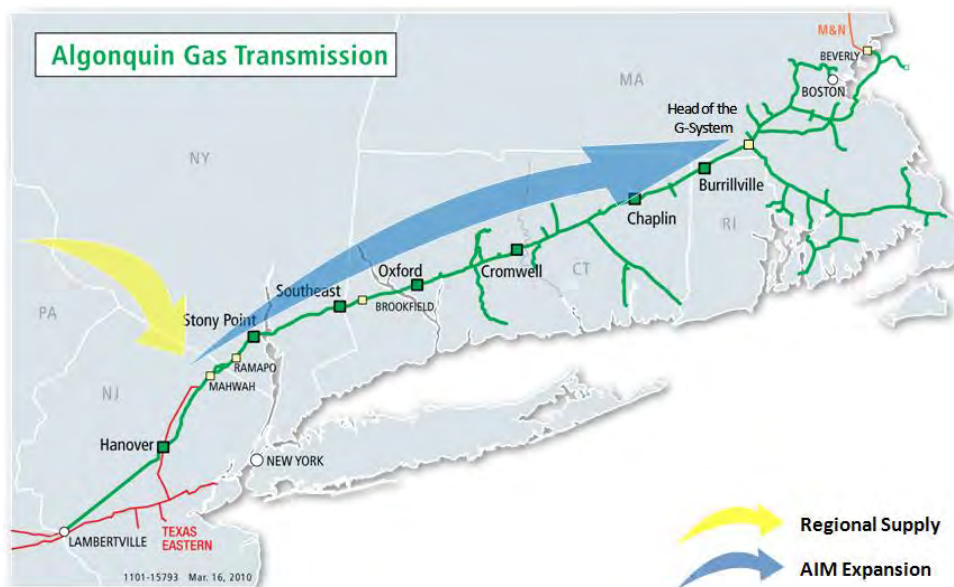

Algonquin has the proven ability and experience to execute the AIM Project. Further, with most of the construction expected to occur within existing rights-of-way and company-owned facilities, Algonquin will develop the project while minimizing impacts to landowners, local communities and the environment. The AIM Project will provide New England with a unique opportunity to secure a cost effective, domestically produced, environmentally friendly source of energy to support its current demand for clean burning natural gas and future growth.

### Project Service

AIM will provide shippers with an opportunity to obtain firm transportation service from a receipt point at Ramapo to multiple existing and proposed mainline delivery points up to and including the head of the G-system. Algonquin contemplates a project expansion capacity of 450,000 Dth/d. Algonquin is willing to consider alternate receipt points as far upstream as Mahwah, as well as alternate delivery points, and an increased or reduced level of expansion capacity depending on project economics. A bidder in the Open Season can qualify as an "Anchor Shipper" for the project by submitting a bid of 100,000 Dth/d or more for a term of 15 years or more. Algonquin is willing to offer Anchor Shippers appropriate rate and rate-related incentives, including but not limited to lower rates than non-anchor shippers, and certain most favored nations rights. Algonquin is also willing to consider providing Anchor Shippers certain other incentives, such as a limited term reduction right and priority rights to obtain unsubscribed project capacity or to relinquish capacity if the project is oversubscribed prior to the service commencement date for AIM. In addition, Algonquin may consider offering other service enhancements or flexibility based on requests made by interested shippers on the Service Request Form. Algonquin anticipates that the AIM expansion project will have a target in-service date of November 2016, but Algonquin is also willing to consider offering service earlier than 2016, depending on project economics and timing of regulatory approvals.

### Project Rates

Rates will be determined at the conclusion of the Open Season and are dependent upon the scope and final facilities required to satisfy the firm service requests for shippers who are awarded capacity and who have executed binding precedent agreements. Shippers will have the option of paying Algonquin's applicable recourse rates for service on the AIM facilities or a negotiated rate for such service, plus any applicable fuel and applicable charges and surcharges.

### **Nomination Process**

During the Open Season period (9:00 a.m., EST, Thursday, September 20, 2012, to 5:00 p.m., EST, on Friday, November 2, 2012) interested parties must submit a Service Request Form, which specifies the Maximum Daily Transportation Quantity (MDTQ), contract term (15-year minimum required), and desired primary receipt and delivery points. The Service Request Form is included in this package. The completed Service Request Form must be executed by a duly authorized representative and mailed, faxed, or emailed in pdf format to Algonquin's offices at:

5400 Westheimer Court, Houston, TX 77056  
Attn: Greg Crisp, Director, Business Development  
gncrisp@spectraenergy.com  
Fax No. (713) 627-4727

Algonquin reserves the right to reject any Service Request Form that is not received on or before 5:00 p.m. EST, on November 2, 2012.

### **Contracting for Service**

After the Open Season concludes, Algonquin representatives will contact all parties who have submitted valid requests and been awarded capacity for the project in order to finalize the terms on which service will be provided. Any party who is awarded AIM capacity must enter into a binding Precedent Agreement. Algonquin reserves the right to reject any party's valid request for service in the event a duly authorized representative of such party has not executed a binding Precedent Agreement on or before 30 days following the end of the Open Season.

### **Capacity Allocation Process**

In the event Algonquin receives valid requests for service that exceed the quantity of pipeline, point or segment capacity that Algonquin is willing to propose for the AIM Project, and Algonquin determines not to expand the applicable pipeline, point or segment capacity, then Algonquin will allocate such capacity on a not unduly discriminatory basis first to qualifying Anchor Shippers executing binding Precedent Agreements and next to other shippers that have executed binding Precedent Agreements. With respect to Anchor Shippers, Algonquin will pro rate such capacity on a not unduly discriminatory basis taking into account the quantities subscribed under each such binding Precedent Agreement, the quantities associated with the primary points and primary firm paths under each such agreement, and other factors on a not unduly discriminatory basis but deeming the economic value of each such agreement to Algonquin to be equal. If, after allocating capacity to Anchor Shippers, Algonquin is able to accommodate some but not all of the pipeline, point or segment capacity nominated by other (non-anchor) shippers, Algonquin will allocate such capacity on a net present value basis among such other shippers based on rate, contract term and MDTQ nominated, with Algonquin having the discretion to grant capacity to any bid or combination of bids that provides the highest net present value. Multiple affiliates of a single entity that collectively submit bids in the

aggregate totaling at least 100,000 Dth/d will, upon request, all be considered Anchor Shippers. A shipper's status as an Anchor Shipper, and the Anchor Shipper's attendant rights, will continue to apply even if the shipper's aggregate capacity (including the capacity of its affiliates) falls below the minimum quantity required to qualify as an Anchor Shipper due to any pro rata allocation resulting from the Open Season.

### **Limitations and Reservations**

Algonquin reserves the right, in its sole discretion, to decline to proceed with the AIM Project. Algonquin also reserves the right to proceed with one or more projects that will be defined through the contracting process and to develop alternative projects from the requests received during this Open Season that may be more representative of the timing requested and markets served. Algonquin reserves the right to negotiate with only those parties that submit valid bids as part of this AIM Open Season. Algonquin also reserves the right to reject any and all bids that do not satisfy the requirements set forth in this Open Season Notice. Without limiting the foregoing, Algonquin may, but is not required to, reject any request for service in which the Service Request Form is incomplete, is inconsistent with the terms and conditions outlined in this Open Season Notice, contains additional or modified terms, or is otherwise deficient in any respect. Algonquin also reserves the right to reject requests for service in the event requesting parties are unable to meet applicable creditworthiness requirements. No request for service shall be binding on Algonquin unless and until duly authorized representatives of both a requesting party and Algonquin have executed a binding Precedent Agreement.

### **Reverse Open Season**

A reverse open season will also be held after this Open Season whereby existing shippers will be afforded an opportunity to turn back existing capacity in accordance with the terms set forth in the reverse open season notice.

### **Communications**

At any time during the Open Season, interested parties are encouraged to contact their Algonquin account manager or Greg Crisp at (713) 627-4611 to discuss any questions or to seek additional information.

ALGONQUIN INCREMENTAL MARKET (AIM) PROJECT  
SUPPLEMENTAL OPEN SEASON AND  
REVERSE OPEN SEASON NOTICE

**Supplemental Open Season**

Algonquin Gas Transmission, LLC (“Algonquin”), a leading provider of natural gas transportation service to the Northeast and New England, is conducting a supplemental open season (“Supplemental Open Season”) in relation to its Algonquin Incremental Market (“AIM”) Project. The AIM Project will provide shippers with an opportunity to obtain firm transportation service from a receipt point at Ramapo, New York, to multiple existing and proposed mainline delivery points up to and including the head of the G-system. Algonquin conducted an Open Season from September 20, 2012, through November 2, 2012 (“Original Open Season”), in which it received bids and executed precedent agreements for a portion of the 450,000 Dth/d of capacity contemplated in the Original Open Season. Algonquin has received sufficient commitments and interest to proceed with the AIM Project.

To provide interested parties the ability to obtain the remaining, uncommitted AIM Project capacity, Algonquin is holding a Supplemental Open Season in which it will accept binding bids for capacity that is not currently subject to executed precedent agreements. In this Supplemental Open Season, Algonquin is willing to consider an increased level of expansion capacity, depending on project economics, as well as requests for alternative delivery points. A bidder in the Supplemental Open Season can qualify as an “Anchor Shipper” for the project by submitting a bid of 100,000 Dth/d or more for a term of 15 years or more. Also, multiple affiliates of a single entity that collectively submit bids in the aggregate totaling at least 100,000 Dth/d will, upon request, all be considered Anchor Shippers. Shippers currently in negotiations related to a bid or bids in the Original Open Season that have not yet executed a binding Precedent Agreement with Algonquin will be deemed to have submitted a bid or bids with the same terms in this Supplemental Open Season. Any capacity that is subject to an executed, binding precedent agreement for this Project pursuant to the Original Open Season will not be included in the Supplemental Open Season.

Nomination Process

During the Supplemental Open Season period (9:00 a.m., EST, on Tuesday, June 11, 2013, to 5:00 p.m., EST, on Tuesday, June 25, 2013) parties interested in obtaining uncommitted AIM Project capacity must submit a Service Request Form, which specifies the Maximum Daily Transportation Quantity (MDTQ), contract term (15-year minimum required), and desired primary delivery points. The Service Request Form is included in this package. The completed Service Request Form must be executed by a duly authorized representative and mailed, faxed, or emailed in pdf format to Algonquin’s offices at:

5400 Westheimer Court, Houston, TX 77056  
Attn: Greg Crisp, Director, Business Development  
gncrisp@spectraenergy.com  
Fax No. (713) 627-4727

Algonquin reserves the right to reject any Service Request Form that is not received on or before end of the Supplemental Open Season period.

### Contracting for Service

After the Supplemental Open Season concludes, Algonquin representatives will contact all parties who have submitted valid requests and been awarded capacity for the Project in order to finalize the terms on which service will be provided. [Pursuant to Algonquin's request, the Federal Energy Regulatory Commission ("FERC") has initiated an environmental review under the National Environmental Policy Act Pre-filing process for the proposed AIM Project.] As part of the Pre-filing process, Algonquin [is working] with FERC, landowners, governmental agencies and other interested stakeholders to finalize the design of the AIM Project facilities. In order not to delay the Pre-filing process, the filing of the certificate application with FERC and the anticipated November 1, 2016, in-service date of the AIM Project, any party awarded capacity in the Supplemental Open Season will be required to execute a binding Precedent Agreement on or before July 31, 2013. Algonquin reserves the right to reject any party's valid request for service in the event a duly authorized representative of such party has not executed a binding Precedent Agreement on or before July 31, 2013.

### Capacity Allocation Process

In the event Algonquin receives valid requests for service that exceed the remaining, uncommitted AIM Project capacity that is the subject of this Supplemental Open Season after taking into account requests received pursuant to the Reverse Open Season held contemporaneously with the Supplemental Open Season, and Algonquin determines not to expand the applicable pipeline, point or segment capacity, then Algonquin will allocate such uncommitted AIM Project capacity on a not unduly discriminatory basis first to qualifying Anchor Shippers executing binding Precedent Agreements and next to other (non-anchor) shippers that have executed binding Precedent Agreements pursuant to this Supplemental Open Season. With respect to Anchor Shippers, Algonquin will pro rate such capacity on a not unduly discriminatory basis taking into account the quantities subscribed under each such binding Precedent Agreement, the quantities associated with the primary points and primary firm paths under each such agreement, and other factors on a not unduly discriminatory basis but deeming the economic value of each such agreement to Algonquin to be equal. If, after allocating capacity to Anchor Shippers, Algonquin is able to accommodate some but not all of the pipeline, point or segment capacity nominated by other (non-anchor) shippers, Algonquin will allocate such capacity on a net present value basis among such other shippers based contract term and MDTQ nominated, with Algonquin having the discretion to grant capacity to any bid or combination of bids that provides the highest net present value. A shipper's status as an Anchor Shipper, and the Anchor Shipper's attendant rights, will continue to apply even if the shipper's aggregate capacity (including the capacity of its affiliates) falls below the minimum quantity required to qualify as an Anchor Shipper due to any pro rata allocation resulting from the Supplemental Open Season.

## **Reverse Open Season**

In relation to its AIM Project and in connection with the Original Open Season and Supplemental Open Season, described above, Algonquin is conducting a reverse open season ("Reverse Open Season") in which Algonquin will consider requests from its current firm shippers who desire to release, subject to the criteria set forth below, all or a portion of their current firm transportation entitlements to reduce the scope of Algonquin's facility requirements for the proposed AIM Project.

### **Release Request Process**

During the Reverse Open Season period (9:00 a.m., EST, on Tuesday, June 11, 2013, to 5:00 p.m., EST, on Tuesday, June 25, 2013), any shippers meeting the criteria set forth below and interested in releasing, on a non-recallable basis, their capacity in connection with the AIM Project must submit a Release Request Form, which specifies the applicable Algonquin contract(s). The Release Request Form is included in this package. The completed Release Request Form must be executed by a duly authorized representative and mailed, faxed, or emailed in pdf format to Algonquin's offices at:

5400 Westheimer Court, Houston, TX 77056  
Attn: Greg Crisp, Director, Business Development  
gncrisp@spectraenergy.com  
Fax No. (713) 627-4727

Algonquin reserves the right to reject any Release Request Form that is not received on or before the end of the Reverse Open Season period. Any Release Request Form received shall be binding on the shipper submitting the notice until Algonquin has completed its analysis of whether the shipper's capacity can be utilized for the limited purposes described herein.

### **Criteria for Release of Capacity**

Shippers interested in releasing capacity in connection with this Project must have contracts for capacity that meet all of the following criteria:

1. Shippers must have firm rights to the capacity they desire to release, on a non-recallable basis, as of the later of November 1, 2016, or the date the AIM Project facilities are placed into service.
2. Shippers' capacity must enable Algonquin to reduce the scope of its proposed AIM Project facilities, as finally scoped and designed, necessary to satisfy Algonquin's obligations pursuant to the Supplemental Open Season and the Original Open Season, while maintaining or improving the economics of the AIM Project.
3. Eligible shippers whose capacity release requests are accepted pursuant to this Reverse Open Season will receive a credit on their monthly invoice for such release in an amount equal to the reservation charges received from the AIM Project shipper(s) utilizing the released capacity during the applicable month, provided the credit will not exceed the amount equal to the eligible shipper's reservation charges associated with such released

capacity for the month. For the term of any such release as described above, eligible shippers will continue to be obligated to Algonquin, and must pay Algonquin, for all reservation charges associated with their capacity, as effective from time to time, subject to the credit described in the preceding sentence.

4. Any and all releases of capacity meeting the criteria set forth herein will be subject to and conditioned on Algonquin's receipt of any and all necessary governmental authorizations with terms and conditions acceptable to Algonquin and Algonquin completing construction of, and placing into service, the AIM Project facilities, subject to any modifications in light of this Supplemental Open Season and Reverse Open Season. No release will become effective until the date on which service commences under the firm agreement(s) for which capacity has been released under this Reverse Open Season.

#### Evaluation of Release Requests

Algonquin will notify all shippers responding to this AIM Project Reverse Open Season as soon as reasonably practicable as to whether their capacity can be utilized for the limited purpose described herein. To the extent there is more capacity meeting the above-stated requirements than is required, all such requests to release capacity will be prorated. For every request to release capacity accepted by Algonquin, the MDTQ set out in that shipper's firm service agreement shall be reduced, as appropriate, in accordance with the request to release capacity and Algonquin's acceptance of such request. The shipper shall lose all rights, including renewal options, on the MDTQ that has been released, but shall continue to receive service on, and be obligated for, all other capacity under the shipper's firm service agreement. Every request to release capacity is binding on the shippers proposing to release capacity in connection with this Reverse Open Season. To the extent Algonquin accepts a shipper's request to release capacity, the shipper must, within thirty (30) days of the date that Algonquin notifies the shipper that a portion or all of its capacity can be utilized for the AIM Project, execute an agreement that will govern the shipper's release of capacity consistent with the provisions set forth in this Reverse Open Season.

### **Limitations and Reservations**

Algonquin reserves the right to proceed with one or more projects that will be defined through the contracting process and to develop alternative projects from the requests received during this Supplemental Open Season and Reverse Open Season that may be more representative of the timing requested and markets served. Algonquin reserves the right to negotiate with only those parties that submit valid bids as part of this Supplemental Open Season or valid requests as part of this Reverse Open Season. Algonquin also reserves the right to reject any and all bids or requests that do not satisfy the requirements set forth in this Supplemental Open Season and Reverse Open Season Notice. Without limiting the foregoing, Algonquin may, but is not required to, reject any request for service or release in which the Service Request Form or Release Request Form is incomplete, is inconsistent with the terms and conditions outlined in this Supplemental Open Season and Reverse Open Season Notice, contains additional or modified terms, or is otherwise deficient in any respect. Algonquin also reserves the right to reject requests for service in the event requesting parties are unable to meet applicable creditworthiness requirements. No request for service or release shall be binding on Algonquin unless and until duly authorized representatives of both a requesting party and Algonquin have executed a binding Precedent Agreement or agreement governing the shipper's release of capacity, respectively.

### **Communications**

At any time during the Supplemental Open Season and Reverse Open Season, interested parties are encouraged to contact their Algonquin account manager or Greg Crisp at (713) 627-4611 to discuss any questions or to seek additional information.

## **AIM PROJECT**

**DOCKET NO. CP14-\_\_\_\_-000**

### **Exhibit Z-2**

Incremental Fuel Derivation

**INCREMENTAL FUEL SHRINKAGE CALCULATION**  
**AIM PROJECT (342,000 Dth/D)**

The incremental fuel for the AIM Project (Project fuel) includes the compression fuel used and lost and unaccounted for gas for gas movement from the Project's receipt point at Ramapo, NY to various delivery points in Connecticut, Rhode Island and Massachusetts. The incremental fuel for the AIM Project is calculated based on fuel required to move the Project volume along this expansion path. This calculation is based on a winter peak day design where gas on the Algonquin system is moved from west to east without inclusion of certain existing east to west contracts.

In order to derive the incremental fuel requirements for the AIM Project, Algonquin first established a base system to determine the base horsepower and fuel. This base system is the recently completed New Jersey-New York Project (Docket CP11-56-000) as approved by the Commission in its Order Issuing Certificate and Approving Abandonment dated May 21, 2012. The base system was then updated for the latest contracts and modified to exclude certain backhaul (east-to-west) services on the Algonquin system to ensure facilities were properly designed for the AIM Project. The expansion system is the base system with added facilities to accommodate the AIM Project volume. The difference in compression requirement at all compressor stations along the expansion path between the Base and Expansion systems is the horsepower requirement for AIM project. Algonquin then used various fuel rates, depending on the type of units, to calculate the total fuel requirement for AIM Project on a winter peak day design. Based on this calculation, Algonquin has determined that a total daily fuel of 14.479 MDth/D is required to accommodate the AIM Project volume from its receipt point to its delivery points. This fuel translates into a winter peak day shrinkage of 4.06%. To derive to an annualized shrinkage, Algonquin used an assumed load factor (shown below) to come up with a weighted average shrinkage for the year. The calculation is as follows:

AIM Daily Fuel Requirement (Peak Day Winter)	= 14.479 MDth/D
AIM Fuel Shrinkage (Peak Day Winter)	= 4.06% (see supporting calculation <sup>(a)</sup> below)
AIM Fuel Shrinkage (Annualized)	= 2.02% (see supporting calculation <sup>(b)</sup> below)

<sup>(a)</sup>  $14.479 / (14.479 + 342.000) = 4.06\%$

<sup>(b)</sup> Load factor used (Jan-Mar @ 100%, Dec&Apr @ 75%, Nov&May @ 50%, Oct&Jun @ 25% and Jul-Sep @ 0%)  
 $(4.06 \times 90 \text{ days} + 4.06 \times 0.75 \times 61 \text{ days} + 4.06 \times 0.50 \times 61 \text{ days} + 4.06 \times 0.25 \times 61 \text{ days} + 4.06 \times 0.0 \times 92 \text{ days}) / 365 \text{ days} = 2.02\%$

## **AIM PROJECT**

**DOCKET NO. CP14-\_\_\_\_-000**

### **Exhibit Z-3**

Form of Protective Agreement

PROTECTIVE AGREEMENT

This Protective Agreement (~~Protective Agreement~~”), is made and entered into as of \_\_\_\_\_, 201\_ (~~Effective Date~~”), by and between Algonquin Gas Transmission, LLC, a Delaware limited liability company (~~Algonquin~~”) and [Counterparty], a [jurisdiction and organization type] (~~Participant~~,” and together with Algonquin, the ~~Parties~~”).

WHEREAS, a certificate application regarding the Algonquin Incremental Market Project (~~Project~~”) is currently pending before the Federal Energy Regulatory Commission (~~Commission~~”) in Docket No. CP14-\_\_\_\_-000 (~~Certificate Proceeding~~”);

WHEREAS, pursuant to Section 388.112(b) of the Commission’s regulations, 18 C.F.R. § 388.112(b) (2013), this Protective Agreement will apply to requests for a copy of the complete, non-public version of any document filed by Algonquin as privileged or as Critical Energy Infrastructure Information (CEII) in the Certificate Proceeding; and

WHEREAS, Participant is submitting this Protective Agreement as part of its request pursuant to 18 C.F.R. § 388.112(b)(iii) for a complete, non-public version of [name of document(s)] included in the Commission’s eLibrary under Accession No[s]. [\_\_\_\_\_] (~~Protected Materials~~”) subject to the terms of this Protective Agreement;

NOW, THEREFORE, Algonquin and Participant agree as follows:

1. This Protective Agreement shall govern the use of all Protected Materials produced by, or on behalf of, Algonquin to Participant hereunder. Notwithstanding any order terminating the Certificate Proceeding, this Protective Agreement shall remain in effect until specifically modified or terminated by (i) written agreement of the Parties, (ii) the Commission or (iii) any applicable Presiding Administrative Law Judge (~~Presiding Judge~~”) (which includes the Chief Administrative Law Judge).

2. This Protective Agreement applies to the Protected Materials, as defined in the recitals to this Protective Agreement. Notwithstanding anything herein to the contrary, Algonquin’s delivery of Protected Materials to Participant pursuant to this Protective Agreement shall not affect the Protected Materials’ protected status under the Commission’s regulations and Freedom of Information Act, 5 U.S.C. 552 (~~FOIA~~”).

3. Definitions -- For purposes of this Protective Agreement:

- (a) The term ~~Notes of Protected Materials~~” means memoranda, handwritten notes, or any other form of information (including electronic form) which copies or discloses materials described in the Protected Materials. Except as specifically provided in this Protective Agreement, Notes of Protected Materials are subject to the same terms and restrictions as the Protected Materials under this Protective Agreement.

- (b) The term ~~“Non-Disclosure Certificate”~~ shall mean the certificate annexed to this Protective Agreement by which the Reviewing Representative(s) of the Participant who have been granted access to Protected Materials shall certify their understanding that such access to Protected Materials is provided pursuant to the terms and restrictions of this Protective Agreement, and that such Reviewing Representative has read the Protective Agreement and agrees to be bound by it.
- (c) The term ~~“Reviewing Representative”~~ shall mean a person who has signed a Non-Disclosure Certificate and who is: (i) an attorney who has made an appearance in this Certificate Proceeding for Participant; (ii) attorneys, paralegals, and other employees associated for purposes of this Certificate Proceeding with an attorney described in Paragraph 3(c)(i); (iii) an expert or an employee of an expert retained by Participant for the purpose of advising, preparing for or testifying in this Certificate Proceeding; or (iv) employees or other representatives of Participant appearing in this Certificate Proceeding with significant responsibility for this docket.

4. Protected Materials shall be made available under the terms of this Protective Agreement only to Participant’s Reviewing Representatives; provided that if the Protective Materials include rates, rate-related provisions and/or credit support provisions, Algonquin may redact the rates, rate-related provisions and credit support provisions from the version of the Protected Materials provided to Participant’s Reviewing Representatives. In the event that Algonquin redacts any such information, the Parties shall meet to discuss the terms and conditions under which one or more of Participant’s Reviewing Representatives may be provided such redacted information. If no agreement is reached, Participant may submit such dispute to the Commission or the Presiding Judge, if any, for resolution.

5. Protected Materials shall remain available to Participant until the later of the date that an order terminating this Certificate Proceeding becomes no longer subject to judicial review, or the date that any other Commission proceeding relating to the Protected Materials is concluded and no longer subject to judicial review. If requested to do so in writing after that date, Participant shall, within fifteen (15) days of such request, return the Protected Materials (excluding Notes of Protected Materials) to Algonquin, or shall destroy the materials, except that copies of filings, official transcripts and exhibits in this proceeding that contain Protected Materials, and Notes of Protected Materials may be retained, if they are maintained in accordance with Paragraph 6, below. Within such time period, Participant, if requested to do so, shall also submit to Algonquin an affidavit stating that, to the best of its knowledge, all Protected Materials and all Notes of Protected Materials have been returned or have been destroyed or will be maintained in

accordance with Paragraph 6. To the extent Protected Materials are not returned or destroyed, they shall remain subject to the Protective Agreement.

6. All Protected Materials shall be maintained by Participant in a secure place. Access to those materials shall be limited to those Reviewing Representatives specifically authorized pursuant to Paragraphs 8-9.

7. Protected Materials shall be treated as confidential by Participant and by the Reviewing Representative in accordance with the Non-Disclosure Certificate executed pursuant to Paragraph 9. Protected Materials shall not be used by Participant or a Reviewing Party except as necessary for the conduct of the Certificate Proceeding, nor shall they be disclosed in any manner to any person except a Reviewing Representative of Participant who is engaged in the conduct of the Certificate Proceeding and who needs to know the information in order to carry out that person's responsibilities in the Certificate Proceeding. Reviewing Representatives may make copies of Protected Materials, but such copies become Protected Materials. Reviewing Representatives may make notes of Protected Materials, which shall be treated as Notes of Protected Materials if they disclose the contents of Protected Materials.

8. (a) A Reviewing Representative may not use information contained in any Protected Materials obtained through this proceeding to give Participant, any customer or potential customer of Algonquin or any competitor of Algonquin a commercial advantage or for any other purpose other than the prosecution or defense of the proceedings conducted under this Certificate Proceeding.

(b) In the event that Participant wishes to designate as a Reviewing Representative a person not described in Paragraph 3(c) above, Participant shall seek agreement from Algonquin. If an agreement is reached, that person shall be a Reviewing Representative pursuant to Paragraph 3(c) above with respect to those materials. If no agreement is reached, Participant may submit the disputed designation to the Commission or the Presiding Judge, if any, for resolution.

9. (a) A Reviewing Representative shall not be permitted to inspect, participate in discussions regarding, or otherwise be permitted access to Protected Materials pursuant to this Protective Agreement unless that Reviewing Representative has first executed a Non-Disclosure Certificate; provided, that if an attorney qualified as a Reviewing Representative has executed such a certificate, the paralegals, secretarial and clerical personnel employed by the same entity as the attorney and under the attorney's instruction, supervision or control need not do so. A copy of each Non-Disclosure Certificate shall be provided to counsel for Algonquin prior to disclosure of any Protected Material to that Reviewing Representative.

(b) Attorneys qualified as Reviewing Representatives are responsible for ensuring that persons under their instruction, supervision or control comply with this Protective Agreement.

authority, to find that this Protective Agreement should not apply to all or any materials previously designated as Protected Materials pursuant to this Protective Agreement.

16. [Intentionally omitted]

17. All Protected Materials filed with the Commission, the Presiding Judge, if any, or any other judicial or administrative body, in support of, or as a part of, a motion, other pleading, brief, or other document, shall be filed and served in sealed envelopes or other appropriate containers bearing prominent markings indicating that the contents include Protected Materials subject to this Protective Agreement.

18. If the Commission or Presiding Judge, if any, finds at any time in the course of this proceeding that all or part of the Protected Materials need not be protected, those materials shall, nevertheless, be subject to the protection afforded by this Protective Agreement for three (3) business days from the date of issuance of the Commission or Presiding Judge's determination, and if Algonquin files an interlocutory appeal or, if applicable, requests that the issue be certified to the Commission, for an additional seven (7) business days. Algonquin has not waived its rights to seek additional administrative or judicial remedies after any decision respecting Protected Materials or Reviewing Representatives. The provisions of 18 C.F.R. §§ 388.112 and 388.113 shall apply to any requests under the FOIA for Protected Materials in the files of the Commission.

19. Nothing in this Protective Agreement shall be deemed to preclude either Party from independently seeking through discovery in any other administrative or judicial proceeding information or materials produced in this proceeding under this Protective Agreement.

20. Algonquin does not waive its right to pursue any other legal or equitable remedies that may be available in the event of actual or anticipated disclosure of Protected Materials.

21. Participant shall not disclose the contents of Protected Materials or any other form of information that copies or discloses Protected Materials to anyone other than in accordance with this Protective Agreement and only use such contents and information in connection with this Certificate Proceeding. Any violation of this Protective Agreement and of any Non-Disclosure Certificate executed hereunder shall constitute a breach of the Protective Agreement.

IN WITNESS WHEREOF, the Parties hereto have caused this Protective Agreement to be duly executed in several counterparts by their proper officers duly authorized as of the Effective Date.

Title\_\_\_\_\_

**[COUNTERPARTY]**

By\_\_\_\_\_

Title\_\_\_\_\_

10. Subject to Paragraph 4 above, any Reviewing Representative may disclose Protected Materials to any other Reviewing Representative of Participant as long as the disclosing Reviewing Representative and the receiving Reviewing Representative both have executed a Non-Disclosure Certificate. In the event that any Reviewing Representative to whom the Protected Materials are disclosed ceases to be engaged in this Certificate Proceeding, or is employed or retained for a position whose occupant is not qualified to be a Reviewing Representative under Paragraph 3(c), access to Protected Materials by that person shall be terminated. Even if no longer engaged in this Certificate Proceeding, every person who has executed a Non-Disclosure Certificate shall continue to be bound by the provisions of this Protective Agreement and the certification.

11. Subject to Paragraph 18, the Commission or Presiding Judge, if any, shall resolve any disputes arising under this Protective Agreement. Prior to presenting any dispute under this Protective Agreement to the Commission or Presiding Judge, the Parties shall use their best efforts to resolve it.

12. All copies of all documents reflecting Protected Materials, including the portion of the hearing testimony, exhibits, transcripts, briefs and other documents which refer to Protected Materials, shall be filed and served in sealed envelopes or other appropriate containers endorsed to the effect that they are sealed pursuant to this Protective Agreement. Such documents shall be marked ~~“PROTECTED MATERIALS”~~ and shall be filed under seal and served under seal upon the Commission, the Presiding Judge, if any, and the other Party. Any such documents containing Critical Energy Infrastructure Information shall be additionally marked ~~“Contains Critical Energy Infrastructure Information – Do Not Release”~~. For anything filed under seal, redacted versions or, where an entire document is protected, a letter indicating such, will also be filed with the Commission and served on the other Party and the Presiding Judge, if any. Counsel shall take all reasonable precautions necessary to assure that Protected Materials are not distributed to unauthorized persons.

13. If Participant desires to include, utilize or refer to any Protected Materials or information derived therefrom in any submission during this proceeding in such a manner that might require disclosure of such material to other participants in the Certificate Proceeding, Participant shall first notify counsel for Algonquin and the Commission or Presiding Judge, if any, of such desire, identifying with particularity each of the Protected Materials. Thereafter, use of such Protected Materials will be governed by procedures determined by the Commission or Presiding Judge, if any.

14. Nothing in this Protective Agreement shall be construed as precluding Algonquin from objecting to the use of Protected Materials on any legal grounds.

15. Nothing in this Protective Agreement shall preclude Participant from requesting the Commission, the Presiding Judge, if any, or any other body having appropriate

**EXHIBIT Z-4  
RESPONSE TO DECEMBER 17 AND 30, 2013 COMMENTS  
ON DRAFT RESOURCE REPORTS 1 THROUGH 12**

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
<b><u>Resource Report 1 –General Project Description</u></b>	
1. Section 1.3 indicates that the maximum allowable operating pressure (MAOP) for the 42-inch-diameter mainline downstream of the Stony Point and Southeast Compressor Stations would be 850 pounds per square inch gauge. Revise Section 1.3 to include the current MAOPs of the existing pipeline sections and the proposed MAOPs of the other proposed pipeline segments.	Section 1.3 has been updated to reflect the MAOPs for the existing pipeline segments and the proposed pipeline segments.
2. Confirm that there are no locations within the proposed take-up and relay pipeline segments where Algonquin would need to deviate from the existing pipeline trench, or identify all such locations.	A response is provided in Section 1.3.1.1.
3. Identify a proposed alignment across the Hudson River.	The proposed alignment across the Hudson River has been selected. See Section 1.3.1 of Resource Report 1 and Section 10.5.3 of Resource Report 10.
4. Explain why the Willimantic, Guilford, and Glastonbury Metering and Regulating (M&R) stations need to be completely rebuilt.	A response is provided in Section 1.3.2.2.
5. Section 1.3.2 identifies eight existing M&R stations in Hartford County, Connecticut and Middlesex, Plymouth, and Norfolk counties, Massachusetts where no work is proposed. Confirm that no pressure testing or uprating would be required at these facilities.	A response is provided in Section 1.3.2.
6. Provide a table listing by milepost (MP) for each right-of-way segment where Algonquin is proposing to use more than 75 feet of construction right-of-way and provide site-specific justification for the increased width.	A response is provided in Section 1.4.1.
7. Provide the acreage of new land that would be permanently affected during operation of the three new M&R stations and the rebuild of the Willimantic M&R Station.	A response is provided on Table 1.4-3.
8. Table 1.4-1 includes a column identifying the widths of the existing and proposed rights-of-way in feet. Clarify if these widths equate to the widths of the existing and proposed maintained rights-of-way.	Table 1.4-1 has been revised to clarify the widths.

**EXHIBIT Z-4  
RESPONSE TO DECEMBER 17 AND 30, 2013 COMMENTS  
ON DRAFT RESOURCE REPORTS 1 THROUGH 12**

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
9. For the Appendix 1A drawings provide the following:	
a. Confirm that Algonquin plans to clear all of the forested areas within the workspace polygons depicted on the drawings and that none of this new workspace would be maintained for operational use following construction as indicated in Table 1.4-3.	Clarification is provided in Section 1.4.2.
b. Indicate on the compressor station and M&R drawings where aboveground facilities would be added or removed.	See compressor station and M&R station plans in Appendix 1A. Design information was provided for all compressor stations (except Oxford, compressor restaging only), existing M&R stations requiring modifications outside of the current developed area of the sites, and the three new M&R stations.
c. Label on the compressor station plot plans the Noise Sensitive Areas (NSAs) within 1 mile of the compressor station sites.	See Resource Report 9, Appendix 9E.
d. The aerial photography for the 42-inch-diameter mainline pipeline, 36-inch-diameter loop extension, and 12-inch-diameter lateral loop is dated February 2012. Aerial photography cannot be more than 1 year old. Demonstrate that the photography used for these pipeline segments would still be accurate at the time of the application filing or provide updated aerial photography.	Algonquin field verified through detailed survey that the aerial photography provided on the alignment sheets and aboveground facility plans accurately represents current site conditions.
10. A column heading in Table 1.4-4 indicates that the column identifies upgrade requirements; however, the column appears to just provide a description of the road. Clarify those roads requiring upgrades or improvements and provide a description for the work that would be done to make them usable for the project. Include the width of the upgraded road and associated acreage of disturbance for the road.	Updated access road information is provided in Section 1.4.3 and on Table 1.4-4.
11. Provide the width and length and associated acreage of the new permanent access roads for the Oakland Heights and West Roxbury M&R Stations.	Updated access road information is provided in Section 1.4.3 and on Table 1.4-4.
12. Provide the locations, sizes (acres), and existing land uses of the proposed pipe and contractor storage yards associated with the project.	Updated information on proposed pipe and contractor storage yards is provided in Section 1.4.4 and on Table 1.4-5.
13. Provide a description of the procedures that would be used for the 0.5 mile of pipe to be abandoned.	A response is provided in Section 1.5.1.2.

**EXHIBIT Z-4  
RESPONSE TO DECEMBER 17 AND 30, 2013 COMMENTS  
ON DRAFT RESOURCE REPORTS 1 THROUGH 12**

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
14. Reconcile the apparent discrepancy in the pipeline mileage numbers for New York between Tables 1.3-1 and 1.5-1.	Table 1.5-1 has been updated accordingly.
15. Describe how water would be removed from the trench should areas of high water table be encountered.	Section 1.5.1.1 describes how water would be removed from the trench should areas of high water table be encountered.
16. For each segment of the proposed project, provide a site-specific explanation for why use of the Federal Energy Regulatory Commission’s (FERC or Commission) third-party compliance monitoring program is not warranted.	A response is provided in Section 1.6.
17. Clarify whether the estimated construction personnel identified in Table 1.7-1 is the average, peak, or total anticipated workforce and ensure the information is consistent with the workforce information provided in Table 5.3-1 in Resource Report 5.	Table 1.7-1 has been clarified.
18. Section 1.10 indicates that Algonquin expects to file for federal and the majority of the state authorizations at the same time as or prior to submitting its certificate application with the FERC. However, Table 1.11-1 indicates that the certificate application would be filed in February 2014 and most of the other permits would be submitted in the second quarter of 2014 or March 2014. Rectify this apparent discrepancy. Provide justification for any permits that would not be filed at the same time as or prior to the FERC application.	Section 1.10 and Table 1.11-1 have been updated.
19. In Table 1.11-1, include the need for FERC authorization to abandon facilities under Section 7(b) of the Natural Gas Act.	Table 1.11-1 has been updated.
20. Table 1.11-1 indicates that a Coastal Zone Management Consistency Determination is needed from the Massachusetts Office of Coastal Zone Management; however, the project does not appear to be within the coastal zone in Massachusetts. Rectify this apparent discrepancy.	Table 1.11-1 has been updated.
21. Revise the information in Section 1.12.3, as needed, to reflect information received from the U.S. Fish and Wildlife Service (USFWS) in their November 7, 2013 comment letter and any subsequent state or federal consultation regarding protected species.	Section 1.12.3 has been updated to reflect the current status of state and federal protected species consultation.

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
22. Identify any non-jurisdictional facilities associated with the project. If non-jurisdictional facilities are identified, provide the following information: a list of the permits required and the permitting agencies with jurisdiction over the facilities; the time period of construction and operation of the non-jurisdictional facilities; the anticipated construction methods; and the anticipated acreage impacts.	A response is provided in Section 1.13.
23. Provide a map showing the location of each of the projects with potential cumulative impacts listed in Table 1.14-1 and add a column to the table for each project’s approximate distance to the proposed project facilities.	Maps showing the location of each of the projects with potential cumulative impacts listed in Table 1.14-1 are provided in Appendix 1F. Table 1.14-1 has been updated by adding a column to the table for each project’s approximate distance to the proposed project facilities.
24. Provide a copy of the Best Drilling Practices Horizontal Directional Drill (HDD) Plan identified in Section 1.14.1 of Resource Report 1.	A copy of the Best Drilling Practices Horizontal Directional Drill (HDD) Plan is provided in Resource Report 2, Appendix 2E.
<b><u>Resource Report 2 – Water Use and Quality, Wetlands</u></b>	
1. Section 2.2.4 lists identified wells within 150 feet of the construction work area for the pipeline facilities but does not list any springs. Clarify and identify if springs are located within 150 feet of the project and if so, add to Table 2.2-2. Also include locations of wells and springs within 150 feet of construction work areas associated with the aboveground facilities.	There are no springs within 150 feet of the construction work area for the Project. For a complete listing of wells, see Section 2.2.4 and Table 2.2-2.
2. Section 2.2.6.1 states that if any blasting is required within 150 feet of any water supply wells, Algonquin would conduct pre- and post-construction monitoring of the wells. Clarify that Algonquin would offer pre- and post-construction monitoring of water supply wells within 150 feet of any construction workspace, including access roads, pipe yards, and compressor stations.	If any blasting is required within 150 feet of any water supply wells, Algonquin will contact the landowner and offer to conduct pre- and post-construction monitoring of well yield and water quality. See Section 2.2.6.1.
3. Provide the results of consultation with the New York State Department of Health regarding the locations of public water supply wells and springs within 150 feet of the project, well head and aquifer protection programs and areas, and surface water supply intakes located within 3 miles downstream of waterbodies affected by the project in New York.	The requested information is provided in Section 2.2.4, Table 2.2-2, Section 2.2.4.1, Table 2.2-3 and Section 2.3.4.3.

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
4. Section 2.2.5 describes how the project has the potential to encounter contaminated groundwater during construction.	
a. Identify which areas would require field sampling for contaminated soils or groundwater.	The requested information is provided in Sections 2.2.5.1 and 2.2.5.2. Additional information is also provided in Appendix 2B.
b. Provide a plan to delineate and analyze the areas of potential contamination within the construction right-of-way.	The requested information is provided in Sections 2.2.5.1 and 2.2.5.2. Additional information is also provided in Appendix 2B.
c. Describe how potentially contaminated groundwater associated with dewatering and contaminated sediment would be managed during construction.	The requested information is provided in Section 2.2.6.
d. Describe the types of engineering controls (e.g., grout trench breakers) that would be used to ensure that contaminated groundwater does not migrate off site along the pipeline corridor, including contaminated runoff due to vegetation clearing.	The requested information is provided in Section 2.2.6.
e. Provide the results of consultation with the appropriate agencies on any groundwater sampling and management measures developed.	The requested information is provided in Sections 2.2.5.1 and 2.2.5.2.
5. Provide an updated list of waterbodies crossed by the project, including access roads (if applicable), following completion of field surveys.	An updated list of waterbodies crossed by the Project is included in Appendix 2C.
6. Provide a copy of the Stormwater Pollution Prevention Plan being prepared for the New York City Department of Environmental Protection to address impacts on the Croton Watershed.	Refer to Section 2.3.1.1 for additional information on the Stormwater Pollution Prevention Plan and impacts on the Croton Watershed.
7. Provide a plan describing the measures that Algonquin would implement to protect the Catskill Aqueduct at MP 9.7 and include any comments on the plan from the aqueduct managers.	See Section 2.3.1.1.
8. Provide a list of streams where blasting would be required and the results of consultation with agencies regarding impacts and mitigation measures.	See Section 2.3.5.5 and Table 2.3-5.
9. Confirm that no access road construction or improvement activities would impact streams or wetlands.	See Sections 2.3.2.3 and 2.4.2.3.
10. Section 2.3.2.3 states that no impacts on navigation would occur as a result of using the HDD method across the Hudson River. Describe any use of boats, barges, or other	See Section 2.3.2.4.

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
vessels that would be used to support the HDD and their potential impacts on river use and resources.	
11. In Section 2.3.4.2, reference the Hudson River Estuary Action Agenda 2010-2014, and address any potential conflicts with the goals and objectives of the plan.	See Section 2.3.4.2.
12. Provide a copy of the stream crossing analysis being prepared for the New York State Department of Environmental Conservation (NYSDEC) as justification for any alternative, in-stream crossing method for all permanently flowing streams where HDD is not proposed and the results of any subsequent consultation.	This information is still in development and will be included in the 401 Water Quality Certification Application that will be filed with the NYSDEC. A copy will be filed with the Secretary at the same time it is filed with the NYSDEC. See Section 2.3.5.4.
13. Discuss the potential for the HDDs to penetrate a lower aquifer, and describe the precautions that would be implemented to prevent the vertical migration of contamination into a lower aquifer.	See Section 2.2.6.1.
14. Provide:	
a. The results of the geotechnical surveys for the proposed HDDs, including the interpretation of the geotechnical information as it relates to the feasibility of each HDD and the potential challenges that may be associated with each proposed drill.	See Section 1.12.2 in Resource Report 1.
b. The site-specific crossing plans and HDD contingency plans. The contingency plans should include how Algonquin would:	Refer to Section 2.3.5.4. Also, see the Best Drilling Practices, Monitoring and Clean-up of Horizontal Directional Drilling Inadvertent Returns for the AIM Project in Appendix 2E.
i. handle any inadvertent release of drilling mud into the waterbody or areas adjacent to the waterbody, including procedures to contain inadvertent releases;	See the Best Drilling Practices, Monitoring and Clean-up of Horizontal Directional Drilling Inadvertent Returns for the AIM Project in Appendix 2E.
ii. seal the abandoned drill hole; and	See the Best Drilling Practices, Monitoring and Clean-up of Horizontal Directional Drilling Inadvertent Returns for the AIM Project in Appendix 2E.
iii. clean up any inadvertent releases in the water.	See the Best Drilling Practices, Monitoring and Clean-up of Horizontal Directional Drilling Inadvertent Returns for the AIM Project in Appendix 2E.

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
15. Identify the anticipated volume of water needed for each HDD. Include a description of anticipated disposal methods for drilling mud and cuttings. Identify any additives besides bentonite that would likely be added to the drilling mud and verify that these additives would not have an adverse effect on water resources in the event that there is a release of drilling fluid into a waterbody or wetland.	See Section 2.3.5.4 and Table 2.3-4.
16. Identify the sources and anticipated discharge locations for the 8 million gallons of water that would be obtained to hydrostatically test the pipeline. Confirm that each pipeline segment would be tested as one segment and that water would be discharged within the same watershed from where it was withdrawn. If the test water would be discharged on land as suggested in Section 2.3.6.1, describe the anticipated rate and duration of the discharge and identify the potential receiving waterbody/wetland or municipal facility once the water passes through the dewatering structures.	See Section 2.3.6.1.
17. Describe how the integrity of the various aboveground facilities would be tested. If hydrostatically tested, indicate the anticipated volume, source, and discharge location for each test.	See Section 2.3.6.1.
18. Provide National Wetland Inventory maps for the project area.	See maps in Appendix 1A.
19. Provide a copy of the wetland delineation report for the project.	The wetland delineation reports are included in Appendix 2F.
20. Identify which of the wetlands listed in Table 2C-1 were field delineated versus delineated using maps and update Table 2C-1 to include wetland impacts within the proposed Hudson River Crossing Study Area (MPs 2.62 to 4.94). Also, provide more detailed classifications for the wetlands listed in Table 2C-1, including whether they are temporarily flooded (A), saturated (B), seasonally flooded (C), etc.	See Table 2D-1, Wetlands Crossed by the AIM Project, in Appendix 2D.
21. Provide any additional information resulting from wetland site visits completed with the U.S. Army Corps of Engineers (USACE) and NYSDEC. Provide an updated Table 2.4-1 that incorporates completed survey results and agency (e.g., USACE and NYSDEC) coordination/consultation.	See Sections 2.4.2.1 and 2.4.5 and Table 2.4-1.

RESPONSE TO DECEMBER 17 AND 30, 2013 COMMENTS  
ON DRAFT RESOURCE REPORTS 1 THROUGH 12**

<b>FERC DATA REQUEST</b>	<b>RESPONSE/LOCATION IN RESOURCE REPORTS</b>
22. Describe impacts on wetlands from aboveground facilities and access roads.	See Sections 2.4.2.2 and 2.4.2.3.
23. Provide a copy of the conceptual wetland mitigation plan for the project with the FERC application.	The Conceptual Mitigation Plan is included in Appendix 2H.
24. Indicate what other agencies besides the USACE (e.g., the NYSDEC, NYS municipalities) have been consulted regarding wetland mitigation. Summarize the discussions with these agencies and provide copies of any new correspondence with the agencies pertaining to wetland mitigation requirements and mitigation plan development. Include a discussion of any proposals for compensation for the permanent loss of wetlands or the conversion of forested wetlands to non-forested wetland types.	The Conceptual Mitigation Plan is included in Appendix 2H.
25. Add USACE district boundaries to all maps in this report and provide revised copies of the maps.	See Section 2.3.2 and Figures 2.2-2, 2.3-1, and 2.3-2.
26. Address the following questions regarding Table 2E-1 for requested variances (which should be called alternate measures or modifications) to the FERC's Wetland and Waterbody Construction and Mitigation Procedures:	See Table 2G-1, ATWS Wetland Variances for the AIM Project Pipeline Segments, provided in Appendix 2G.
a. Provide a separate appendix with site-specific maps showing each of the locations where modifications are being requested.	See Table 2G-1, ATWS Wetland Variances for the AIM Project Pipeline Segments, provided in Appendix 2G.
b. Add a column to Table 2E-1 that identifies the crossing width for each wetland variance being requested and confirm that wetland disturbance acreages listed in Table 2C-1 reflect the modified widths.	See Table 2G-1, ATWS Wetland Variances for the AIM Project Pipeline Segments, provided in Appendix 2G.
c. For wetland B13-RLR-W2, provide more justification as to why a greater than 75 foot right-of-way is required and whether construction could occur during dry subsoil conditions.	See Table 2G-1, ATWS Wetland Variances for the AIM Project Pipeline Segments, provided in Appendix 2G.
d. For wetland B13-RLR-W9, provide clarification if Algonquin is proposing to bore beneath the wetland in conjunction with Highway 210, Cedar Pond Brook (B13-RLR-S10), and Cedar Flats Road. If boring is proposed, provide justification for the requested modification for a greater than 75-foot-wide right-of-way at this wetland location.	See Table 2G-1, ATWS Wetland Variances for the AIM Project Pipeline Segments, provided in Appendix 2G.
e. It appears on the alignment sheets that the pipeline does not cross wetland B13-	See Table 2G-1, ATWS Wetland Variances for the AIM Project

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
RLR-W10; according to Table 2C-1 the crossing length is 0 feet. Provide additional justification for the requested modification for a greater than 75-foot-wide right-of-way width in this wetland.	Pipeline Segments, provided in Appendix 2G.
f. The mileposts provided for wetland B13-SPLR-W7 and wetland A13-SELR-W4 listed in Table 2E-1 do not match their milepost locations on the alignment sheets. Clarify the correct milepost locations for these wetlands and revise Table 2E-1 accordingly.	See Table 2G-1, ATWS Wetland Variances for the AIM Project Pipeline Segments, provided in Appendix 2G.
g. The additional temporary workspace justifications listed for the Line 36A Loop Extension state that the extra workspace is required for “the equipment associated with constructing 42 inch pipeline in wetlands”, when a 36-inch-diameter pipeline is being proposed for this loop. Provide additional justification as to why additional construction right-of-way is being requested for the installation of a 36-inch-diameter pipeline (particularly for B13-CLR-W4 where a 100-foot workspace is being requested).	See Table 2G-1, ATWS Wetland Variances for the AIM Project Pipeline Segments, provided in Appendix 2G.
<b><u>Resource Report 3 – Fish, Wildlife, and Vegetation</u></b>	
1. The portion of the project crossing the Hudson River is within the Hudson River Estuary and within the extent of tidal influence and salt water intrusion. This means there is the potential for protected marine species to occur as transients in the project area, although relatively infrequent or unlikely. Provide a discussion of all marine species (i.e., harbor seals, dolphin/porpoise) with the potential to occur within the project portion of the Hudson River Estuary and a statement regarding how the project would ensure compliance with the Marine Mammal Protection Act.	See Sections 3.3.5 and Section 3.4.1.
2. Provide an update on consultations with the New York State Office of Parks, Recreation & Historic Preservation; the Town of Haverstraw; the Westchester County Department of Parks, Recreation and Conservation; and any other appropriate agencies regarding any specific plans required for construction through the sensitive habitats identified in Section 3.4.3.	See Section 3.3.7.3.
3. Identify any fisheries time-of-year restrictions on construction for stream crossings identified in Table 2B-1 of Resource Report 2 and discuss Algonquin’s plans for addressing these restrictions.	See Section 3.2.7 for a discussion on fisheries time-of-year restrictions on construction for stream crossings.

RESPONSE TO DECEMBER 17 AND 30, 2013 COMMENTS  
ON DRAFT RESOURCE REPORTS 1 THROUGH 12**

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
4. Section 3.4.3.2 states that “a variety of marine species such as bluefish, anchovy, silversides, and blue claw crab may enter the area”. Additionally, marine species are included in Section 3.2.5. Therefore, Table 3.2-1 should identify marine species, not just estuarine and diadromous species. Revise accordingly.	Table 3.2-1 has been updated.
5. Include an Invasive Species Management Plan and indicate Algonquin’s willingness to implement the invasive species permit conditions contained in the Connecticut Department of Energy and Environmental Protection’s (CTDEEP) October 11, 2013 comment letter.	Section 3.3.3 and Appendix 3F: Invasive Plant Species Control Plan
6. Identify proposed pipe yards and contractor storage yards including acreage by vegetation type and any disturbance to sensitive resources.	Pipe yards and contractor storage yards are discussed in 3.3.1.3.
7. Clarify/provide acres and types of vegetation affected by the project (additional temporary workspace, aboveground facilities, staging areas, and access roads). Update Table 3C-1 for aboveground facility impacts.	Vegetation affected by the Project is discussed in 3.3.4 and in Table 3C-1 in Appendix 3C.
8. Section 3.3.1.4 states that two new permanent access roads for the West Roxbury and Oakland Heights M&R Stations would be constructed in wooded areas. Clarify the vegetative communities of the wooded areas that would be impacted by new road construction.	Vegetative communities of the wooded areas that would be impacted by new road construction are discussed in 3.3.1.4.
9. Clarify whether rare plant surveys were conducted for the project area and if so, provide the results of the surveys.	The status of rare plant surveys are discussed in Section 3.3, Section 3.4.1.1 and Section 3.4.1.4.
10. Provide the results of consultation with the CTDEEP regarding the potential for twinflower and yellow fringed orchid to occur within the project area.	The results of consultation with the CTDEEP are discussed in Section 3.4.1.4.
11. File any correspondence or documentation of consultation with federal, state, or local agencies not previously filed with the Commission regarding concerns, recommendations, or the need to conduct surveys for sensitive species. This includes additional correspondence or other documentation related to consultation with the USFWS for the bald eagle, Indiana bat, northern long-eared bat, New England	Section 3.5.1.2 provides additional documentation of consultation with federal, state, or local agencies. Also see Appendix 1E in Resource Report 1.

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
cottontail, bog turtle, and small-whorled pogonia.	
12. In its response to comments, Algonquin states that it is committed to conducting any surveys deemed necessary by agencies to confirm the presence/absence of protected species. Address the November 7, 2013 letter from the USFWS with respect to surveys and provide updates on the status of ongoing consultations with the USFWS regarding the need for surveys or other measures to minimize impacts.	Sections 3.4.1 and 3.5.1.2 addresses the November 7, 2013 letter from the USFWS with respect to surveys.
13. Per the November 7, 2013 letter from the USFWS, the northern red-bellied cooter ( <i>Pseudemys rubriventris</i> ) has the potential to occur within the Town of Middleborough, and the initial project determination of <i>no effect</i> was based on outdated distribution information. Therefore, address the Northern red-bellied cooter in Section 3.5 and update Table 3.5-1 to include the northern red-bellied cooter.	Section 3.4.1 addresses the November 7, 2013 letter from the USFWS with respect to surveys.
14. The northern long-eared bat ( <i>Myotis septentrionalis</i> ) was proposed for federal listing as endangered on October 2, 2013 and is identified by the USFWS (IPaC and November 7, 2013 letter) as having the potential to occur within project counties. Address this species in Section 3.5 and update Table 3.5-1 to include the northern long-eared bat.	Section 3.4.1 addresses the November 7, 2013 letter from the USFWS with respect to surveys.
15. Provide the results of the Indiana bat habitat assessment. Also, update the state/county locations of Indiana bat occurrence in Table 3.5-1 to match the text in Section 3.5.1.1.	Section 3.4.1 addresses the November 7, 2013 letter from the USFWS with respect to surveys.
16. Table 3B-1 in Appendix 3B provides a comprehensive list of wildlife species by habitat type, including Estuary. Include a discussion of this habitat type in Section 3.4.1.	A discussion on the Estuary habitat type is provided in Section 3.3.5.
17. Indicate which best management practices Algonquin is proposing to use to protect the timber rattlesnake and provide the timber rattlesnake conservation plan and any comments from the NYSDEC on this plan.	Section 3.4.1.3 provides additional information about timber rattlesnake BMPs.
18. Indicate which conservation measures would be implemented for the protection of the eastern box turtle in Connecticut and any comments from the CTDEEP on these	Section 3.4.1.4 provides additional information regarding conservation measures that will be implemented for the protection of the eastern box turtle.

measures.	
19. Provide all new information developed during the preparation of the Connecticut comprehensive conservation plan for Connecticut state-listed species identified in CTDEEP's October 11, 2013 comment letter.	Section 3.4.1.4 provides all new information developed during the preparation of the Connecticut comprehensive conservation plan for Connecticut state-listed species.
20. Provide the results of the USFWS determination of presence of federally-listed species within the vicinity of the Burrillville Compressor Station site in Rhode Island and M&R stations added after the initial consultation was conducted.	Section 3.4.1.5 provides the results of the USFWS determination of the presence of federally-listed species within the vicinity of the Burrillville Compressor Station site in Rhode Island and M&R stations.
21. Provide a table listing migratory bird species and their associated habitats for the Atlantic Northern Forest Bird Conservation Region (BCR 14). This table may be limited to those species associated with habitats that would be impacted by the project.	Section 3.5 discusses migratory birds. Table 3E-1 in Appendix 3E lists migratory bird species and their associated habitats for the Atlantic Northern Forest Bird Conservation Region.
22. Provide correspondence or other documentation of follow-up consultation with the USFWS regarding the recommendation contained in their November 7, 2013 comment letter requesting that vegetation removal not occur during the migratory bird nesting season.	Section 3.5 addresses the November 7, 2013 letter from the USFWS with respect to surveys.
23. Update the Atlantic Sturgeon discussion in Section 3.5.1.1 to include the potential occurrence of all distinct population segments with the potential to occur in the project area, as referenced in the National Marine Fisheries Service (NMFS) letter dated May 30, 2013.	Section 3.4.1.2 provides an updated discussion on the Atlantic Sturgeon.
24. Update the discussion and potential occurrence for both the Atlantic and Shortnose sturgeon based on the information provided in the NMFS letter dated May 30, 2013.	Section 3.4.1.2 provides an updated discussion on the sturgeon.
<b><u>Resource Report 4 – Cultural Resources</u></b>	
1. Provide copies of all correspondence with the Connecticut State Historic Preservation Office (SHPO), Massachusetts SHPO, New York SHPO, and Rhode Island SHPO regarding the need for cultural resources surveys and level of intensity of those surveys.	See Appendix 4A.  ♦ New York SHPO concurred with PAL’s proposal to perform an archaeological identification survey for proposed AIM Project facilities in New York on July 19, 2013;

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
	February 24, 2014.
a. a discussion of the project’s area of potential effects;	See Section 4.4; Appendix 4C – Chapter 1 of each technical report.
b. accurate map legends to depict surface finds and test pits;	See Appendix 4C – Results chapters of each technical report.
c. ethnographic analysis of Native American groups or other groups with ties to the project area;	N/A; Algonquin anticipates that the FERC will consult directly with Native American groups who have an interest in AIM Project facilities. Native American groups have informed Algonquin that they will be working with FERC in a government-to-government fashion.
d. for each cultural resource identified, provide a large-scale individual resource map (such as 1 inch = 200 feet) showing topography, areas surveyed or tested, artifact concentrations, cultural features, structures, resource boundaries, pipeline centerline, construction right-of-way, and other project features;	See Appendix 4C – Results chapters of each technical report.
e. photographs and/or illustrations of visible cultural features and diagnostic/important artifacts; and	See Appendix 4C – Results chapters of each technical report.
f. for each resource identified, provide an analysis of the data collected and further discussion/basis for recommendations on eligibility for listing on the National Register of Historic Place.	See Appendix 4C – Results and Recommendations chapters for each technical report.
4. Provide information regarding the stone walls that have been identified during the cultural resources survey and how they would be treated.	See Appendix 4C – Results and Recommendations chapters for each archaeological survey technical report; Appendix E for New York and Connecticut pipeline survey reports; Appendix F for New York and Connecticut M&R/Compressor Station survey reports. No stone walls were identified within the Rhode Island or Massachusetts AIM Project facility study areas.
5. Under Section 4.3.1, 2 <sup>nd</sup> paragraph, clarify if the New York SHPO concurred with the archaeological testing in a letter dated June 19, 2013 or July 19, 2013.	July 19, 2013: see Appendix 4A.
6. Provide a summary of the areas of concern by the Mohegan Tribe and how those areas	N/A; Mohegan Tribal representatives accompanied Algonquin archaeologists during fieldwork along the E-1 System Loop. Tribal

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
would be investigated or treated.	representatives expressed an interest in monitoring archaeological fieldwork for other AIM Project facilities as well. No specific information was conveyed by Mohegan Tribal representatives to the archaeologists during fieldwork concerning areas of Native American interest, aside from general locational areas within the study area. Algonquin assumes that FERC will consult directly with Native American tribes who have an interest in AIM Project facilities. Native American groups have informed Algonquin that they will be working with FERC in a government-to-government fashion.
7. Clarify if the project crosses Palisades Interstate Park, which is a National Historic Landmark.	The AIM Project does not cross the Palisades Interstate Park; the Project only crosses the Palisades Interstate Parkway; see Appendix 4C (NY Historic Architectural Properties Overview/Identification Survey Report, Appendix C [Palisades Interstate Park National Register of Historic Places Documentation]).
8. Provide resumes of key cultural resources personnel and their roles in collecting, analyzing, and reporting information in the reports.	See Appendix 4D.
9. Revise the Unanticipated Discovery Plan included as Appendix 4-C in the Environmental Report filed as part of Algonquin’s application to the FERC, as follows:	See Appendix 4E.
a. Page 4, ninth bullet – replace “FERC” with “CRM”;	See Appendix 4E.
b. Page 5, second bullet – replace “will” with “may”;	See Appendix 4E.
c. Page 5, Principle 7– replace “inadvertently discovered” with “encountered”;	See Appendix 4E.
d. Page 6, Principle 8, eighth bullet, first sub bullet, second sentence – replace “FERC will consult” with “CRM will contact”;	See Appendix 4E.
e. Page 12 and 13, delete Non-Federally Recognized Tribal Contacts (Consulting Parties).	See Appendix 4E.

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
10. Document that the revised Unanticipated Discovery Plan was submitted to the appropriate SHPOs and file their comments on the plan with the FERC.	See Appendix 4A: the revised Unanticipated Discovery Plan was submitted to the appropriate SHPOs on February 24, 2014.
<b><u>Resource Report 5 – Socioeconomics</u></b>	
1. Table 5.1-1 indicates that there are 3.3 miles in Rockland County, New York and 11.7 miles in Westchester County, New York. However, Table 1.3-1 in Resource Report 1 indicates 6.8 miles in Rockland County and 8.2 miles in Westchester County. Revise this apparent discrepancy. Also, include a MP column in Table 5.1-1, similar to Table 1.3-2 in Resource Report 1.	See Section 5.2, Table 5.1-1.
2. For comparison purposes, include a column in Table 5.2-1 for the 2012 estimated U.S. Census Bureau population data referenced in the paragraphs following the table.	See Section 5.2.1, Table 5.2-1.
3. Include a totals row by state in Table 5.2-3 as reference is made to those totals in Section 5.3.3.	See Section 5.2.3, Table 5.2-3.
4. Section 5.2.6 states that, in addition to the pipeline, the analysis focused on the counties and municipalities where aboveground facilities could result in socioeconomic impacts. Clarify in this section whether those are just the counties and municipalities where the new metering and regulating (M&R) stations are proposed or if it includes other facilities as well. Specifically identify the applicable aboveground facilities included in this particular analysis.	See Section 5.2.6.
5. In Section 5.2.6, provide tables comparing the racial/ethnic and economic statistics of the counties, census tracts, and block groups crossed by the proposed project in New York and Connecticut. Also, revise Tables 5.2-5 and 5.2-6 for Massachusetts to include the statistics for all the census tracts and block groups crossed, not just those that meet the environmental justice criteria.	See Section 5.2.6. Tables 5.2-6 and 5.2-7 have been added for New York and include all the census tract and block groups crossed. Tables 5.2-8 and 5.2-9 have been added for Connecticut and include all the census tract and block groups crossed. Previous Tables 5.2-5 and 5.2-6 for Massachusetts are now Tables 5.2-10 and 5.2-11 and include all the census tract and block groups crossed.
6. Provide the number of permanent employees that would be hired to operate the proposed facilities.	See Section 5.3.1 for a discussion on the number of permanent employees that would be hired to operate the proposed facilities.
7. Clarify the apparent discrepancies between workforce numbers identified in Section	See Section 5.2.3. Table 5.3-1 has also been revised to be consistent

RESPONSE TO DECEMBER 17 AND 30, 2013 COMMENTS  
ON DRAFT RESOURCE REPORTS 1 THROUGH 12**

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
5.3.2 (1 <sup>st</sup> paragraph and Table 5.3-1) and construction personnel numbers provided in Table 1.7-1 of Resource Report 1.	with Table 1.71- of Resource Report 1.
8. Section 5.3.2 indicates that approximately 10 to 78 percent of the construction workers are expected to be local hires, and that this is "substantial." Explain the reason for the wide range in numbers, and justify how 10 percent is considered substantial.	See Section 5.3.2.
9. In Section 5.3.5, include a table on the ad valorem taxes to be paid over the life of the project and provide an estimate in dollars of the anticipated purchases of materials from local (New York, Connecticut, and Massachusetts-based) vendors during construction and operation of the project.	See Section 5.3.5. Table 5.3-5 has been added with an estimate of the ad valorem taxes to be paid over the life of the AIM Project and provides an estimate in dollars of the anticipated purchases of materials from local (New York, Connecticut, and Massachusetts-based) vendors during construction and operation on each County and municipality affected by the AIM Project.
10. Provide information on the location (e.g., milepost (MP), distance from the proposed construction right-of-way) and orientation (north, south, east, or west) of schools and hospitals within 0.5 mile of the proposed facilities and provide additional details about the existing capacity of these facilities (e.g., number of hospital beds, number of students).	Table 5.2-5 in Section 5.2.4 has been developed to provide this additional information. Table 5.2.4 has information already regarding the number of hospital beds on a county level. However, Algonquin did not find any hospitals located within 0.5 mile of the pipeline facilities, and as a result did not provide that information in Table 5.2.5. Therefore, Table 5.2.5 only concentrates on new information related to schools.
11. Provide data and analysis of the existing traffic levels for the roads along the West Roxbury Lateral and how the project would affect those levels during construction and operation. At a minimum, the analysis should include the current level of service (LOS) for the applicable roads and whether the project would change the LOS during construction and operation. Other information that would be helpful includes a sampling of the average daily traffic counts of the major roads affected.	See Section 5.3.7. Algonquin provided a draft of the Traffic Management Plan prepared for the West Roxbury Lateral with the Secretary on January 31, 2014 for review and comment. Algonquin anticipates filing updated plans for the West Roxbury Lateral and the New York segments of the Project with the Secretary on or before May 30, 2014.
12. Section 5.3.7.1 states that Algonquin would schedule work within roadways to avoid commuter traffic and school buses. However, construction work is identified to occur between the hours of 7 am and 6 pm. Clarify the construction work hours within roadways that would be implemented to avoid commuter traffic and school bus	See Section 5.3.7 and the interim Traffic Management Plan provided in Appendix 5B.

**ALGONQUIN GAS TRANSMISSION, LLC  
Algonquin Incremental Market (“AIM”) Project

RESPONSE TO DECEMBER 17 AND 30, 2013 COMMENTS  
ON DRAFT RESOURCE REPORTS 1 THROUGH 12**

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
schedules.	
13. To assist in addressing scoping comments regarding potential impacts on traffic, particularly in the New York and Massachusetts portions of the project, and access during construction, the site-specific traffic and access management plans to be prepared by Algonquin as indicated in Resource Report 1 should include, at a minimum, the following appropriate details:	See Section 5.3.7 and the interim Traffic Management Plan provided in Appendix 5B.
a. width of the street to be closed and the width of the street to remain open to through traffic;	See Section 5.3.7 and the interim Traffic Management Plan provided in Appendix 5B.
b. temporary traffic controls (e.g., detours, durations, etc.) and type of control devices and temporary control zone activities;	See Section 5.3.7 and the interim Traffic Management Plan provided in Appendix 5B.
c. pedestrian, bicycle, and worker considerations;	See Section 5.3.7 and the interim Traffic Management Plan provided in Appendix 5B.
d. hand signaling control including how many controllers would likely be required at each site, whether and how local police or other public service employee support would be needed in each area, and who would be responsible for compensation of any traffic controllers, police, or other public employees; and	See Section 5.3.7 and the interim Traffic Management Plan provided in Appendix 5B.
e. season, timing, and duration of construction (e.g., estimated months, when construction would occur (e.g., day, night, weekdays, weekends), and length of time required to complete construction along each particular street).  A preliminary draft of the site-specific traffic and access management plan for at least the West Roxbury Lateral should be provided for review and comment prior to the filing of Algonquin’s formal application with the FERC.	See Section 5.3.7 and the interim Traffic Management Plan provided in Appendix 5B.
14. Assess the potential economic impacts of construction on local communities and businesses associated with temporary traffic delays and impeded access.	See in Section 5.3.7.1.
<b><u>Resource Report 6 – Geology</u></b>	
1. Provide a table by MP of areas that may require blasting along the pipeline segments. Also indicate whether blasting is anticipated at any of the new or expanded	Refer to the AIM Project Rock Removal Plan Provided in Appendix 6C.

**ON DRAFT RESOURCE REPORTS 1 THROUGH 12**

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
aboveground facilities.	
2. Provide a detailed blasting plan specific to the proposed project.	Refer to the AIM Project Rock Removal Plan Provided in Appendix 6C.
3. Section 6.4 identifies the West Roxbury Crushed Stone Quarry as a commercial quarry located in close proximity to the project. Provide a description of current quarry operations and any planned expansions. Also include a detailed evaluation of potential impacts on the quarry associated with the proposed project and similarly, impacts of quarry operations on construction and operation of the West Roxbury Lateral and M&R station. The evaluation should include all aspects of construction and operation (e.g., traffic, blasting, safety, etc.).	See Section 6.4. An analysis of the effects of the quarry blasting is being prepared. Algonquin expects to file the analysis on or before March 31, 2014.
4. Identify any sensitive paleontological resources either along the pipeline segments or at any of the aboveground facilities.	Section 6.5 “Paleontological Resources” has been added.
5. Revise Section 6.5.2 to include a description of the earthquakes in the area that have been related to the Ramapo Fault. Also, provide a more detailed evaluation of how earthquakes related to this fault could impact the proposed project facilities.	Sections 6.6.1 and 6.6.2 have been updated to provide a greater explanation of current understanding of the relationship between seismicity, the Ramapo fault, and crustal stresses.
<b><u>Resource Report 7 – Soils</u></b>	
1. Identify what soil characteristics were used to determine water erosion potential for those soils where K factors were not available.	This is addressed throughout Resource Report 7.
2. Table 7E-1 lists the MP associated with the NY LTANKS site <i>Benjamin Residence 1326 Lower Washington Street</i> along the Stony Point to Yorktown Take-up & Relay segment as MP 30. This pipeline segment is only 11.7 miles long. Rectify this apparent discrepancy.	See Appendix 7F, Table 7F-1. This apparent discrepancy has been resolved.
3. Section 7.3.6 states that the EDR report provides a detailed list of potentially contaminated sites within 1 mile of the pipeline centerline, but, only sites within 500 feet of the pipeline were reviewed for their potential to impact pipeline construction. However, in some cases, the set of tables provided in Appendix 7E list sites greater than 500 feet away. Use a consistent 500-foot impact assessment radius or explain	See Appendix 7F. EDR reports will be narrowed down to contain only sites within 500’.

**RESPONSE TO DECEMBER 17 AND 30, 2013 COMMENTS**  
**ON DRAFT RESOURCE REPORTS 1 THROUGH 12**

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
why sites greater than 500 feet from the pipeline centerline were included.	
<b>Resource Report 8 –Land Use, Recreation, and Aesthetics</b>	
1. The number of miles and percentages of land uses crossed in the text of Section 8.2.1 do not match those in Table 8.2-1. For example, the text indicates that 25.3 miles (46 percent) of open land would be crossed while Table 8.2-1 indicates 20.7 miles (41 percent) would be crossed. Also, it appears that the 2.3 miles associated with the Hudson River crossing are included in the numbers in the text because the total adds up to 36.7, but it is not included in Table 8.2-1. Clarify or explain these apparent discrepancies.	Section 8.2-1 and Table 8.2-1 have been updated to correct this discrepancy. The discrepancy was due to the omission of the Hudson River crossing numbers in the table.
2. Revise Table 8.2-2 to complete the leased or owned column for all the compressor stations currently left blank.	Table 8.2-2 in Section 8.2-2 has been completed.
3. Table 8.2-2 indicates that the workspace for the Cromwell Compressor Station is confined to Middlesex County. However, Table 8A-2 in Appendix 8A indicates the workspace is in both Hartford and Middlesex Counties. The site plan for this compressor station does not show the workspace extending past the county line. Clarify or explain this apparent discrepancy.	Cromwell Compressor Station is located only in Middlesex County. The site plan is correct. Workspace is confined only in Middlesex County. Table 8A-2 in Appendix 8A has been corrected.
4. Section 8.3.1.1 indicates that pipeline construction in New York would result in temporary impacts on approximately 166.3 acres of open land and of this total, approximately 87 acres of open land consists of the existing permanent easement. However, Table 8A-1 in Appendix 8A indicates that these are the total acres for New York, not those just associated with open land. Clarify or explain this apparent discrepancy.	Table 8A-1 in Appendix 8A was correct. Section 8.3.1.1 has been updated to be consistent with Table 8A-1.
5. Provide the acreage by land use associated with operation of the project.	Operation land use acreages are included in Table 8A-1 under the “new perm” and “existing perm” columns and are described in the text within Section 8.3.1.1.
6. Describe the crops grown on the agricultural land affected by the project and whether any are considered specialty crops.	See Section 8.3.1.1 – Agricultural Land.

**ALGONQUIN GAS TRANSMISSION, LLC  
Algonquin Incremental Market (“AIM”) Project  
DOCKET NOS. PF13-16-000 AND CP14-\_\_-000**

**EXHIBIT Z-4  
RESPONSE TO DECEMBER 17 AND 30, 2013 COMMENTS  
ON DRAFT RESOURCE REPORTS 1 THROUGH 12**

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
7. Section 8.3.1.1 indicates that an additional 6.6 acres of agricultural land would be acquired as new permanent right-of-way. However, Table 8A-1 in Appendix 8A indicates it would be 3.0 acres. Clarify or explain this apparent discrepancy.	Table 8A-1 in Appendix 8A was correct. Section 8.3.1.1 has been updated to be consistent with Table 8A-1.
8. Update the land use impacts for all the M&R stations based on the current design.	Land use impacts in Section 8.3.1.2 for all M&R stations have been updated based on the current design.
9. In Section 8.3.1.2, it indicates that 3.3 acres of land outside the existing fence line at the Cortlandt M&R Station would be required during construction, including 0.2 acre of industrial/commercial land, 1.44 acres of open land, and 1.3 acres of forest/woodland land. However, this only adds up to 2.9 acres. Provide the land use for the remaining 0.4 acre.	Section 8.3.1.2, Cortlandt M&R Station numbers have been corrected.
10. In Section 8.3.1.2, it indicates that 11.6 acres of industrial land would be affected at the Burrillville Compressor Station. However, Table 8A-2 in Appendix 8A indicates that 10.6 acres of industrial land would be affected. Revise this apparent discrepancy.	Table 8A-2 is correct. Section 8.3.1.2 has been updated to correct the apparent discrepancy.
11. For those access roads requiring upgrades or improvements, provide the associated acreage of disturbance by land use type.	See Section 8.3.1.3 and Tables 8A-1 and 8A-2.
12. Confirm that each affected landowner has been notified of proposed private access road improvements and modifications, and describe any concerns they have expressed.	See Section 8.3.1.3.
13. Revise Table 8A-1 to provide a breakdown of the acreage associated with the temporary construction right-of-way versus additional temporary workspace for the pipeline facilities. The total acreage shown for the additional temporary workspace should match the total acreage obtained from Table 8.3-1.	Table 8A-1 in Appendix 8A has been revised to include the breakdown. The total acreage shown for the ATWS in Table 8A-1 matches the total acreage obtained from Table 8.3-1.
14. Resolve the discrepancy between the text in Section 8.3.1.6 and Table 8.3-2. The text says that there are 107 public road crossings and 4 railroad crossings; however, the table shows a total of 107 crossings, 103 roads and 4 railroads.	Section 8.3.1.6 and Table 8.3-2 have been revised accordingly.
15. Section 8.3.1.6 and Table 8.3-1 discuss road crossings. Clarify by differentiating road-crossing activities (bore, HDD, or open-cut) from in-road construction (open-cut to bury	Table 8.3-2 lists all roads being impacted by pipeline construction and differentiates road-crossing activities (e.g., proposed construction

ON DRAFT RESOURCE REPORTS 1 THROUGH 12**

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
the pipeline longitudinally within the roadway), and list and discuss all roads being impacted by pipeline construction.	methods). As noted in Section 8.3.1.6, these construction methods are discussed in more detail in Section 1.5.1 of Resource Report 1.
16. Table 8D-1 lists a weigh station at MP 1.30 of the Southeast to MLV-19 Take-up & Relay segment as being in New York when it appears to be in Connecticut. In Section 8.3.2, that would then result in non-residential structure counts of 24 for NY and 8 for CT (rather than 25 and 7, respectively). Revise this apparent discrepancy.	Section 8.3.2 has been updated to correct the apparent discrepancy.
17. The count of structures within 50 feet on Table 8D-1 looks incomplete for the Southeast to MLV-19 Take-up & Relay segment. Specifically:	Table 8D-1 has been updated to reflect additional structures located within 50 feet.
a. No structures are identified between MPs 2.8 and 3.0 (alignment sheet SQ-A-1006), but it looks like there may be a structure within 50 feet on the south side of the right-of-way near approximately MP 2.9.	Table 8D-1 has been updated to reflect additional structures located within 50 feet.
b. The last structure identified for this segment is at MP 4.04. However, there appear to be more structures within 50 feet between MPs 4.04 and 4.4 (the end of the segment) (alignment sheet SQ-A-1009).	Table 8D-1 has been updated to reflect additional structures located within 50 feet between MP 4.04 to the end at MP 4.5.
18. Because of the high density of residences along the project area, site-specific plans will be required for all single or multifamily residential, condominium, or apartment building structures within 50 feet of the construction work area. Provide the plans to the owner of each residence and provide the owner a reasonable amount of time to review and comment on these plans. File these plans along with any comments from the property owner(s) and identify how Algonquin would keep residents informed of the progress of construction in the vicinity of their respective residences. Each site-specific residential plan needs to include:	For the residences within 50 feet of the construction workspace, Algonquin is developing individual Residential Construction Plans noting special construction techniques and mitigation measures. Algonquin will provide the plans to the owner of each residence at the end of March 2014 and will provide the owner a reasonable amount of time to review and comment on these plans. Algonquin intends to file the plans with the Secretary on or before April 30, 2014 along with any comments received from the property owner(s)
a. A dimensioned site plan at a legible scale that clearly shows:	See Response 18 above.
i. the location of the residence in relation to the new pipeline and any existing pipelines and/or other utilities;	See Response 18 above.
ii. the boundaries of all permanent and temporary construction work areas and distances from permanent structures;	See Response 18 above.
iii. other nearby structures, roads, waterbodies, and residential features (including decks, pools, swings, fences, driveways, etc.); indicating what would be removed and any areas with restrictions after construction;	See Response 18 above.

ON DRAFT RESOURCE REPORTS 1 THROUGH 12**

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
19. Revise Table 8D-2 to consistently provide the location of every identified planned development relative to the project.	Table 8D-2 in Appendix 8D has been updated and is consistent information presented with regards to the location of every identified planned development relative to the AIM Project.
a. For those areas crossed, provide the beginning and ending MP and total length crossed.	Table 8D-2 in Appendix 8D provides the beginning and ending MP and total length crossed.
b. For those areas not directly crossed, provide the distance and direction from the nearest point along the construction work area.	Table 8D-2 in Appendix 8D provide the distance and direction from the nearest point along the construction work area for those areas not directly crossed.
c. Provide the planned construction/development timeframes for each area.	Table 8D-2 in Appendix 8D provide the planned construction/development timeframes for each area
d. Provide documentation of correspondence with the owners/developers of the planned areas.	Table 8D-2 in Appendix 8D provides documentation of correspondence with the owners/developers of the planned areas.
e. Describe efforts to minimize any conflicts associated with the proposed Project.	Table 8D-2 in Appendix 8D describes efforts to minimize any conflicts associated with the proposed Project for any potentially affected planned construction/development areas.
20. Provide an update and documentation of correspondence regarding discussions with West Point Partners associated with its proposal to construct an AC/DC converter station on property currently owned by Con Edison in the Hamlet of Verplanck as part of a new electric transmission line project. Describe potential conflicts with Algonquin’s potential use of the site during construction across the Hudson River.	See Table 8D-2 in Appendix 8D and the footnote.
21. Revise Table 8.4-1 to include the New York Critical Environmental Areas crossed by the project and the recreational property in the Town of Lebanon crossed by the E-1 System at MP 2.79. In the text of Section 8.4.3, provide a description of the protected open space identified in Table 8.4-1 along the E-1 System Take-up & Relay segment and near the Farmington M&R Station. Also, for each of the areas identified in the table and text, consistently provide the following information.	Table 8.4-1 and Section 8.43 have been updated to consistently provide the requested information.
a. For those areas crossed, list the owner's name, beginning and ending MP, total length crossed, estimated area (acreage) to be affected, and any significant features or structures on the property that would be impacted.	Table 8.4-1 and Section 8.43 have been updated to consistently provide the requested information.

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
b. For those areas not directly crossed, provide the distance and direction from the nearest point along the construction work area.	Table 8.4-1 and Section 8.43 have been updated to consistently provide the requested information.
c. Summarize for each area any consultations that have occurred with, and any specific concerns that have been identified by, the owners or managers of these properties.	Table 8.4-1 and Section 8.43 have been updated to consistently provide the requested information.
d. Summarize for each area any deed restrictions that limit certain types of activities on these properties, the nature of each restriction, and the process required to obtain a pipeline easement through these areas.	See Section 8.4.
e. Describe the specific mitigation measures that would be implemented to minimize impacts on these areas.	See Mitigations Measures in Section 8.3.1.1.
22. Provide a map showing the coastal zone area crossed in New York and per minimum filing requirements, provide a coastal zone consistency determination or evidence that a request for a consistency determination has been filed with the New York State Coastal Management Program ((§380.12(j)(4 & 7)).	See Section 8.4.6. A New York coastal zone boundary map is provided in Appendix 8F of Resource Report 8. Algonquin has filed its consistency statement with the NYSDOS concurrently with this Application. A copy is being filed with the Secretary contemporaneously with the application filing.
23. Indicate whether Algonquin plans to develop and implement an environmental complaint resolution procedure and if so, describe what the procedures would include and how they would be implemented.	Algonquin has developed an environmental complaint resolution procedure plan procedure to address landowner calls and letters during construction. This plan addresses the procedures Algonquin would take and how they would be implemented ( <i>see</i> Appendix 8E in Resource Report 8).
24. Section 8.6 indicates that Algonquin would attempt to leave trees in place along Oakland Heights Road as screening between the new Oakland Heights M&R Station and the residences. If the trees need to be removed, describe alternative measures (e.g., replanting new trees) that Algonquin would implement to minimize visual impacts on the nearby residences.	See Section 8.6.
25. Section 8.6 states that there would be no visual impacts at the site of the Assonet M&R Station because the new building would be consistent with the existing land uses of and at this site. Provide additional details on how the new building would be consistent with the existing land uses.	See Section 8.6.

RESPONSE TO DECEMBER 17 AND 30, 2013 COMMENTS  
ON DRAFT RESOURCE REPORTS 1 THROUGH 12**

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
<b><u>Resource Report 9 – Air Quality and Noise</u></b>	
1. Existing conditions in Section 9.2.4 should be considered and revised to reflect all facilities of the project (particularly Section 9.2.4.4), not just the compressor station facilities.	Section 9.2.4 has been revised to reflect all proposed facilities.
2. Provide copies of all federal, state, and local air permit applications (construction and/or operation) applicable to the project, including, if necessary, applications for emission-generating sources at M&R stations. Include detailed emission calculations (pounds per hour and tons per year) for all criteria pollutants, greenhouse gas (GHG) emissions, and hazardous air pollutants (HAPs). If applicable, also provide any air quality modeling reports.	Copies of the air permit applications and any associated modeling reports for the compressor stations are provided in Appendix 9A.  Detailed emissions calculations are included in the permit applications and are summarized in Section 9.2.6.2, Tables 9.2-8 through 9.2-12.  The need for air permit applications for Project M&R stations is addressed in Section 9.2.5.1 and 9.2.5.2.
3. If air quality modeling is not required by federal, state, or local air permitting, provide a screening-level modeling analysis (e.g., AERSCREEN) to demonstrate compliance with National Ambient Air Quality Standards or State Ambient Air Quality Standards at all stations where additional compression is proposed.	The requested supplemental air quality analyses are provided in Appendix 9C.
4. Provide an estimate of construction emissions (criteria pollutants, GHG emission, and HAPs) and comparison to General Conformity thresholds, broken down per air quality control region. If project construction emissions exceed General Conformity de minimis thresholds, describe how the project would demonstrate conformity in accord with General Conformity regulations.	Detailed construction emissions are provided in Appendix 9D and summarized in Section 9.2.6.5, Tables 9.2-15 through 9.2-19.  A General Conformity Analysis with comparisons of relevant Project emissions with General Conformity de minimis thresholds is provided in Appendix 9B. The Project does not exceed the thresholds.
5. Provide estimated annual emissions from vented gases.	Estimated emissions of vented gases at compressor stations (i.e., gas releases) are provided in Tables 9.2-8 through 9.2-12 and in the air permit applications in Appendix 9A.  Estimated emissions of vented gases at from Project M&R stations and the new/replacement pipeline are provided in Table 9.2-13 and 9.2-14, respectively.
6. Provide noise survey reports for all compressor station sites, M&R stations, and HDD entrance and exit points. Include existing noise data (station operating at full load if an existing station), a plot plan, maps identifying the closest NSAs, detailed noise	The requested noise survey reports, acoustical analyses and comparison with applicable noise standards are provided in Appendices 9F, 9G and

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
calculations estimating the future noise at the new or expanded station, and proposed noise control equipment. Include a comparison to the FERC’s noise standard and any applicable local noise ordinances.	9H, and are summarized in Section 9.3.3.  Applicable noise standards are discussed in Section 9.3.2.
7. Provide construction equipment noise estimates including duration of noise generating activities and a comparison to any noise standards applicable to construction noise.	Construction equipment noise estimates are provided in Section 9.3.4.2 and Table 9.3-12.  Applicable noise standards identified to date are discussed in Section 9.3.2.
8. Consult with municipalities in Rhode Island to identify any local noise ordinances applicable to the project. Include a summary of these ordinances and comparison of project noise emissions to the applicable standards.	See Section 9.3.2.2.
<b><u>Resource Report 10 - Alternatives</u></b>	
1. Provide additional details and discussion to explain how the locations of the proposed lift and relay and loop segments were identified and any alternative locations that were considered. Explain why the current locations are more feasible and operationally preferable.	Section 10.4.
2. Provide a table that compares the West Roxbury Lateral Alternative route to the corresponding segment of the currently proposed alignment. The table should include the following:	See Section 10.5.1 for a discussion on the comparison of the West Roxbury Lateral Alternative route to the corresponding segment of the proposed alignment.
a. total length (miles);	
b. number of residences within both 50 and 100 feet of pipeline route;	
c. impacts on wetlands (feet);	
d. number of waterbodies crossed;

**ON DRAFT RESOURCE REPORTS 1 THROUGH 12**

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
e. number of road crossings;	
f. number of railroad crossings; and	
g. length of in-street construction (miles).	
3. Provide a similar analysis for an alternative route to the southern portion of West Roxbury Lateral that would be collocated with Route 1 and the Boston Providence Highway rather than following Rustcraft Road and Elm Street.	See Section 10.5.2 for a discussion on the comparison of the West Roxbury Lateral South End Alternative route to the corresponding segment of the proposed alignment.
4. In its October 29, 2013 Response to Scoping Comments, Algonquin indicates that it is continuing to investigate and evaluate viable route variations for the West Roxbury Lateral. Provide an update on these evaluations and an analysis of identified variations that would reduce impacts along various portions of the route (e.g., around the Legacy Place Shopping Center).	See Section 10.6.
5. Provide a feasibility assessment for the proposed and alternative alignments for the HDD of the Hudson River when the geotechnical investigations in the Hudson River Study Area are completed. Provide a comparison table for all of the alternative routes considered that includes the criteria listed in question 10-1. In addition, provide a discussion regarding potential impacts each alternative route would have on the Indian Point Energy Center.	See Section 10.5.3 for a discussion on the Hudson River Alternative alignments.
6. Provide a detailed discussion and mapping of the alternative sites that were examined for each of the new M&R stations (i.e., Oakland Heights, Assonet, and West Roxbury). The discussion should identify specific engineering or environmental reasons why each alternative was not chosen.	See Section 10.7.
7. Discuss the feasibility of installing electric driven compressor units instead of natural gas driven units at each of the modified compressor stations.	See Section 10.4.
<b><u>Resource Report 11 – Reliability and Safety</u></b>	
1. Describe any additional safety measures that would be implemented near high-voltage	See Section 11.4.2

ON DRAFT RESOURCE REPORTS 1 THROUGH 12**

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
transmission lines. Indicate if an additional grounding system would be installed for this project.	
2. In its October 29, 2013 Response to Scoping Comments, Algonquin indicates that either remote shutoff or auto shutoff equipment would be installed at newly installed valve sites. Resource Report 11 appears to only discuss remote shutoff valves. Explain whether or not auto shutoff valves would be installed and if so, where.	See Section 11.4.3.2
3. Provide the class locations and high consequence areas (HCAs), by milepost, associated with the West Roxbury Lateral.	See Section 11.2.1.3, Table 11-2.
4. The note in Table 11.2 states that the HCA designations are based on the existing Algonquin pipeline facilities. Verify that the HCA designations for the project facilities are current based on the most recent annual review of HCA's as defined in Spectra's Integrity Management System.	See Section 11.2.1.3, Table 11-2.
5. Section 11.2.1.2 states that the proposed project facilities would be designed, constructed, operated, and maintained to meet or exceed U.S. Department of Transportation Minimum Federal Safety Standards set forth in Part 192. Provide an explanation of the additional measures that would be implemented to exceed the requirements of 49 Code of Federal Regulations Part 192. Also identify the specific areas or locations where the exceeded measures would apply.	See Section 11.2.1.2
6. Section 11.2.1.3 states that Algonquin would treat the entire pipeline route as if it was an HCA. Further clarify what Class design specifications Algonquin intends to construct to for all areas of the Project.	See Section 11.2.1.3
7. Address the concerns identified in Entergy's October 14, 2013 letter to the FERC regarding the Indian Point Energy Center. Include a discussion of the specific regulations applicable at the site.	See Section 10.5.3 of Resource Report 10
<b><u>Resource Report 12 – PCB Contamination</u></b>	
1. Describe the historical concentrations of polychlorinated biphenyls (PCBs) detected in the existing facilities that would be impacted by the Project. If no PCB sampling has	See Section 12.0.

historically been completed at these existing facilities, use the closest sampling points to estimate the concentrations of PCB’s that may be encountered.	
<b><u>Other Agency Comments</u></b>	
1. Address the comments provided by the Connecticut Siting Council in the attached letter dated December 3, 2013.	See below.
<b><u>Connecticut Siting Council Comments:</u></b>	
1. Restrict vegetative clearing along the right-of-way to the months of November 1 to April 1 to reduce the impact to wildlife as much as possible;	<p>Algonquin’s policies concerning the re-growth of woody species are first and foremost designed to protect the safe operation of the pipeline. As part of its efforts to do so, Algonquin must facilitate access for maintenance and operations of the pipeline, including a mandatory patrol (aerial and foot) program to observe surface conditions on and adjacent to the right-of-way (“ROW”) for indications of leaks, construction activity, and other factors affecting safety and operation. In addition, Algonquin must maintain an adequate line of sight between pipeline markers.</p> <p>Consequently, in upland portions of the ROW, Algonquin maintains the permanent easement by conducting periodic clearing of woody vegetation along the entire width of the permanent easement on a cycle no less frequently than every 3 years. Routine vegetation maintenance clearing does not occur between April 15<sup>th</sup> and August 1<sup>st</sup> of any year to avoid impacting ground-nesting birds and other wildlife. This mowing timing restriction is consistent with the <i>FERC Upland Erosion Control, Revegetation and Maintenance Plan</i>. Because of the reasons noted above, Algonquin is not willing to extend the mowing restriction.</p>
2. Use of wood chips to serve as an erosion control measure along cleared portions of the temporary workspace locations and right-of-way after clearing is completed. No details were provided as to how erosion would be controlled between the initial clearing phase and pipe installation phase;	Algonquin has developed a detailed Erosion & Sedimentation Control Plan (“E&SCP”) that will be implemented for the AIM Project. The E&SCP details the erosion control methods that will be used.
3. Adoption of a five year cutting cycle for right-of-way maintenance after completion of the project to enhance production and the use of brushy habitats within the permanent	In Algonquin’s experience, it can become quite difficult to see the limits of the permanent ROW areas from both the air and the ground after a 3

ON DRAFT RESOURCE REPORTS 1 THROUGH 12**

FERC DATA REQUEST	RESPONSE/LOCATION IN RESOURCE REPORTS
right-of-way;	year period. Moreover, the cleared area of the ROW provides a crucial visual cue to third parties, especially landowners, who may not otherwise realize that there is a natural gas pipeline or pipelines underground, on or in the vicinity of their property. In the absence of such visual cues, landowners are more likely to treat such areas as wooded areas and not recognize the need for caution. Finally, a 3 year maintenance cycle where mowing avoids the primary nesting periods for ground-nesting birds and other wildlife, provides an opportunity for sufficient cover for wildlife without jeopardizing the ability to observe and monitor the ROW. Algonquin does not see the need to modify its current mowing cycle.
4. Increase the blade height of right-of-way maintenance mowers to a minimum of six inches above grade to increase survival rates of wildlife utilizing the right-of way; and	Algonquin agrees to modify the blade height of the mowers in areas that support suitable habitat for wildlife.
5. Consideration of installing larger diameter piping to accommodate future regional growth and reasonable predicted future needs. Such installation would create longer term economic and environmental benefits, serving to benefit Connecticut’s current policy of substantially increasing the penetration of natural gas into local markets.	As reflected in the FERC certificate application, Algonquin is proposing to construct the AIM Project to increase its mainline pipeline capacity by 342,000 Dth/d to satisfy the transportation needs of the Project Shippers that sought Project capacity in the two open seasons held by Algonquin. Consistent with Commission policy, the AIM Project is appropriately designed based on the firm commitments Algonquin has received from these shippers. In response to the changing natural gas markets in the Northeast, Algonquin is frequently in contact with existing and potential shippers regarding various proposals to expand its pipeline facilities. Currently, however, Algonquin does not have any developed plans to expand its facilities along the Project route.

Docket No. CP14-\_\_\_\_-000

**ABBREVIATED APPLICATION OF  
ALGONQUIN GAS TRANSMISSION, LLC  
FOR A CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY  
AND FOR RELATED AUTHORIZATIONS**

( )

Take notice that on February 28, 2014, Algonquin Gas Transmission, LLC (~~Algonquin~~), 5400 Westheimer Court, Houston, Texas 77056, filed with the Federal Energy Regulatory Commission an application under Section 7(c) of the Natural Gas Act (~~NGA~~) for its proposed Algonquin Incremental Market (~~AIM~~) Project. Specifically, Algonquin requests: (i) authorization under NGA Sections 7(b) and 7(c) to construct, own, operate, and maintain 37.6 miles of take-up and relay, loop and lateral pipeline facilities and related facilities in New York, Connecticut, and Massachusetts, modify six existing compressor stations in New York, Connecticut and Rhode Island resulting in the addition of 81,620 horsepower of compression, modify 24 existing metering and regulating (~~M&R~~) Stations and construct three new M&R Stations, and abandon certain existing facilities; (ii) authorization for an initial incremental AIM Project recourse rate and related incremental fuel, and initial firm and interruptible recourse rates for service on the West Roxbury Lateral; and (iii) any waivers, authority, and further relief as may be necessary to implement the proposal contained in its application.

Algonquin requests that the Commission grant the requested authorizations and related approvals on or before January 31, 2015. Algonquin states that issuing an order by this date will help to ensure that the AIM Project is in service by November 1, 2016, in time to meet the transportation needs of the AIM Project shippers for the 2016-17 winter heating season.

The name, address, and telephone number of the person to whom correspondence and communications concerning this Application should be addressed is:

Berk Donaldson  
Director, Rates and Certificates  
Algonquin Gas Transmission, LLC  
P.O. Box 1642  
Houston, Texas 77251-1642  
Phone: (713) 627-4488  
Fax: (713) 627-5947

Any person desiring to intervene or to protest this filing must file in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 C.F.R. §§ 385.211 and 385.214). Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a notice of intervention or motion to intervene, as appropriate. Such notices, motions, or protests must be filed on or before the comment date. Anyone filing a motion to intervene or protest must serve a copy of that document on the Applicant. On or before the comment date, it is not necessary to serve motions to intervene or protests on persons other than the Applicant.

The Commission encourages electronic submission of protests and interventions in lieu of paper using the "eFiling" link at <http://www.ferc.gov>. Persons unable to file electronically should submit an original and 14 copies of the protest or intervention to the Federal Energy Regulatory Commission, 888 First Street, N.E., Washington, D.C. 20426.

This filing is accessible on-line at <http://www.ferc.gov>, using the "eLibrary" link and is available for review in the Commission's Public Reference Room in Washington, D.C. There is an "eSubscription" link on the web site that enables subscribers to receive email notification when a document is added to a subscribed docket(s). For assistance with any FERC Online service, please email [FERCOnlineSupport@ferc.gov](mailto:FERCOnlineSupport@ferc.gov), or call (866) 208-3676 (toll free). For TTY, call (202) 502-8659.

FEDERAL ENERGY REGULATORY COMMISSION

Algonquin Gas Transmission, LLC

Docket Nos. CP14-96-000  
PF13-16-000

NOTICE OF APPLICATION

(March 18, 2014)

Take notice that on February 28, 2014, Algonquin Gas Transmission, LLC (Algonquin), 5400 Westheimer Court, Houston, Texas 77056, filed in the above referenced docket an application pursuant to sections 7(b) and 7(c) of the Natural Gas Act (NGA) for the proposed Algonquin Incremental Market Project (AIM Project). Specifically, Algonquin requests authorization to: (i) construct, install, operate, and maintain approximately 37.6 miles of take-up and relay, loop, and lateral pipeline facilities, and appurtenances in New York, Connecticut, and Massachusetts; (ii) modify six existing compressor stations in New York, Connecticut, and Rhode Island, resulting in the addition of 81,620 horsepower (HP) of compression; (iii) modify 24 existing metering and regulating (M&R) stations and construct three new M&R stations; (iv) abandon certain existing facilities; and (v) approval of the pro forma tariff records to establish the incremental AIM Project firm transportation rate, an incremental fuel percentage applicable to service on the AIM Project, and the initial recourse rates for service on the West Roxbury Lateral (which is part of the proposed AIM Project, but has separate rate schedules). Algonquin states that the AIM Project will provide a total of 342,000 dekatherms per day of firm transportation service. Algonquin estimates the cost of the AIM Project to be approximately \$971,551,683, all as more fully set forth in the application which is on file with the Commission and open to public inspection. The filing is available for review at the Commission in the Public Reference Room or may be viewed on the Commission's website web at <http://www.ferc.gov> using the "eLibrary" link. Enter the docket number excluding the last three digits in the docket number field to access the document. For assistance, contact FERC at [FERCOnlineSupport@ferc.gov](mailto:FERCOnlineSupport@ferc.gov) or call toll-free, (886) 208-3676 or TYY, (202) 502-8659.

Any questions concerning this application may be directed to Berk Donaldson, Director, Rates and Certificates, Algonquin Gas Transmission, LLC, PO Box 1642, Houston, Texas 77251-1642, by telephone at (713) 627-4488 or by facsimile at (713) 627-5947.

On June 28, 2013, the Commission staff granted Algonquin's request to utilize the Pre-Filing Process and assigned Docket No. PF13-16-000 to staff activities involved in the AIM Project. Now, as of the filing of the February 28, 2014 application, the Pre-

Docket Nos. CP14-96-000  
PF13-16-000

- 2 -

Filing Process for this project has ended. From this time forward, this proceeding will be conducted in Docket No. CP14-96-000, as noted in the caption of this Notice.

Pursuant to section 157.9 of the Commission's rules (18 CFR 157.9), within 90 days of this Notice, the Commission staff will either: complete its environmental assessment (EA) and place it into the Commission's public record (eLibrary) for this proceeding; or issue a Notice of Schedule for Environmental Review. If a Notice of Schedule for Environmental Review is issued, it will indicate, among other milestones, the anticipated date for the Commission staff's issuance of the final environmental impact statement (FEIS) or EA for this proposal. The filing of the EA in the Commission's public record for this proceeding or the issuance of a Notice of Schedule for Environmental Review will serve to notify federal and state agencies of the timing for the completion of all necessary reviews, and the subsequent need to complete all federal authorizations within 90 days of the date of issuance of the Commission staff's FEIS or EA.

There are two ways to become involved in the Commission's review of this project. First, any person wishing to obtain legal status by becoming a party to the proceedings for this project should, on or before the comment date stated below file with the Federal Energy Regulatory Commission, 888 First Street, NE, Washington, DC 20426, a motion to intervene in accordance with the requirements of the Commission's Rules of Practice and Procedure (18 CFR 385.214 or 385.211) and the Regulations under the NGA (18 CFR 157.10). A person obtaining party status will be placed on the service list maintained by the Secretary of the Commission and will receive copies of all documents filed by the applicant and by all other parties. A party must submit seven copies of filings made in the proceeding with the Commission and must mail a copy to the applicant and to every other party. Only parties to the proceeding can ask for court review of Commission orders in the proceeding.

However, a person does not have to intervene in order to have comments considered. The second way to participate is by filing with the Secretary of the Commission, as soon as possible, an original and two copies of comments in support of or in opposition to this project. The Commission will consider these comments in determining the appropriate action to be taken, but the filing of a comment alone will not serve to make the filer a party to the proceeding. The Commission's rules require that persons filing comments in opposition to the project provide copies of their protests only to the party or parties directly involved in the protest.

Persons who wish to comment only on the environmental review of this project should submit an original and two copies of their comments to the Secretary of the Commission. Environmental commentators will be placed on the Commission's environmental mailing list, will receive copies of the environmental documents, and will be notified of meetings associated with the Commission's environmental review process.

Docket Nos. CP14-96-000  
PF13-16-000

- 3 -

Environmental commentors will not be required to serve copies of filed documents on all other parties. However, the non-party commentors will not receive copies of all documents filed by other parties or issued by the Commission (except for the mailing of environmental documents issued by the Commission) and will not have the right to seek court review of the Commission's final order.

The Commission strongly encourages electronic filings of comments, protests and interventions in lieu of paper using the “eFiling” link at <http://www.ferc.gov>. Persons unable to file electronically should submit an original and 7 copies of the protest or intervention to the Federal Energy regulatory Commission, 888 First Street, NE, Washington, DC 20426.

Comment Date: April 8, 2014.

Kimberly D. Bose  
Secretary

Re: *Algonquin Gas Transmission, LLC*, Docket No. CP14-96-000  
Supplemental Information – Site Specific Crossing Plans for HDDs &  
West Roxbury Crushed Stone Blasting Assessment

Dear Ms. Bose:

On February 28, 2014, Algonquin Gas Transmission, LLC (“Algonquin”) filed its Abbreviated Application for a Certificate of Public Convenience and Necessity and for Related Authorizations (“Application”) with the Federal Energy Regulatory Commission (“Commission”) for its Algonquin Incremental Market Project. Algonquin hereby submits the site specific crossing plans for the Hudson River and the I-84/Still River horizontal directional drills referenced on page 2-33 of Resource Report 2 included in Exhibit F-I of the Application. Additionally, Algonquin hereby submits the West Roxbury Crushed Stone Quarry blasting impact assessment referenced on page 6-19 of Resource Report 6 included in Exhibit F-I of the Application. Algonquin also is attaching a table with estimated dates for the submission of the remaining updates and supplemental information to Exhibit F-1. Finally, Algonquin has attached an updated Exhibit J table which contains the status of other federal and state permits and consultations.

If you have any questions regarding this filing, please contact me at (713) 627-4488 or Chris Harvey, Manager, Rates and Certificates at (713) 627-5113.

Sincerely,

/s/ Berk Donaldson

# **ALGONQUIN INCREMENTAL MARKET PROJECT**

## **Analysis of the West Roxbury Crushed Stone Operations on Construction and Operation of the West Roxbury Lateral**

**March 31, 2014**

**TABLE OF CONTENTS**

---

**1.0 EXECUTIVE SUMMARY..... 1**

## 1.0 EXECUTIVE SUMMARY

---

Algonquin Gas Transmission, LLC (“Algonquin”) has completed a comprehensive evaluation of: (1) the potential impacts on the West Roxbury Crushed Stone Quarry (“Quarry”) associated with the proposed AIM Project West Roxbury Lateral and meter and regulating (“M&R”) station; and (2) the potential impacts of Quarry operations on the construction and operation of the West Roxbury Lateral and M&R station.

With regard to the potential impact on the Quarry’s operations, Algonquin has discussed the anticipated schedule and logistics associated with constructing the West Roxbury Lateral and M&R station with the owners of the Quarry. No direct conflicts were identified that would inhibit the construction of the West Roxbury Lateral and M&R station or the continued day-to-day operation of the Quarry. Algonquin has committed to continue to consult with the Quarry owners to establish traffic management measures that will be implemented during construction. As was outlined in Resource Report 5 of Algonquin’s formal certificate application filed with the FERC on February 28, 2014, a detailed Traffic Management Plan is in development for the West Roxbury Lateral. Algonquin expects to file the Traffic Management Plan with the FERC on or before May 30, 2014. Once construction is complete, Algonquin does not anticipate any further impact on the Quarry from the operation and maintenance of the West Roxbury Lateral and M&R station.

In order to evaluate the potential impacts to the proposed pipeline and M&R station from the blasting operations at the Quarry, Algonquin retained the services of a local third-party geotechnical firm, GZA GeoEnvironmental, Inc. (“GZA”). Algonquin tasked GZA with analyzing the effects of current and potential future Quarry blasting operations. GZA’s report is provided in Attachment A. A description of the current operation as well as the limits of future Quarry expansion is included in the GZA report. In order to ensure that the report reflected a conservative approach in estimating possible impacts on Algonquin’s facilities, GZA assumed, hypothetically, that such future blasting within the Quarry would occur up to five feet from the Quarry property line along Grove Street, thereby minimizing the setback distance between Algonquin’s facilities and the Quarry’s blasting. The GZA report determined that the current or future blasting operations at the Quarry will not affect the safe operation and integrity of the pipeline or M&R station.

As described in detail in the report in Attachment A, studies have been performed and published discussing the resistance of buried pipelines to blast-induced vibrations. Calculations to evaluate the reserve strength within pipelines to resist the applied energy from blasts allow designers to analyze the site-specific and project-specific tolerance of a pipeline to stresses caused by vibrations. Assuming that hypothetical aggressive set of circumstances where the Quarry might extend its operation to within 5 feet of Grove Street, the GZA report determined that the proposed West Roxbury Lateral pipeline will be subject to vibrations well within pipeline design, with a minimum factor of safety of 10 to 20 times for the proposed gas pipeline. Thus, the GZA report concluded that ground vibrations from future blasting at the Quarry will not damage the proposed pipeline.

The proposed West Roxbury Lateral pipeline will be installed by specialized pipeline construction contractors using proven industry practices. The pipeline will be buried to a depth from the top of the pipe of at least 3 to 5 feet below existing ground surface and will consist of externally coated high strength steel with welded connections. The pipe will be installed within an excavation and enveloped in an engineered backfill consisting of either compacted sand or flowable fill (a low density concrete sand mixture) extending a minimum of 8 inches below the pipe, a minimum of 6 inches on both sides of the pipe and a minimum of 6 inches over the pipeline. This engineered backfill is designed to support the pipe evenly while maintaining the integrity of the pipe’s protective coating. The flowable fill layer will also provide a warning barrier to protect the pipe from third-party contractors.

The M&R station buildings will be engineered pre-fabricated pre-cast concrete structures designed for industrial use and will not contain large exterior glass windows, or finishes susceptible to cracking. The in-line tool receivers/launchers and the heaters will be above-grade, steel construction, and are not considered especially sensitive to vibrations. The M&R station facilities are all bolted onto foundations and well supported. The GZA report concluded that the components of the M&R station, which will be located further away from the Quarry than the pipeline in Grove Street, are not considered to be any more sensitive to vibration disturbance or damage than the below-grade pipeline and that ground vibrations from future blasting at the Quarry will not be disruptive or damaging to the M&R station.

After review, the GZA report states that based on the location of the proposed M&R station relative to the Quarry, the probability of a projectile stemming from a blast operation at the Quarry (*i.e.*, fly-rock) landing on the M&R station site is highly unlikely, potentially in the range of 10,000,000 to 1, with the probability of such a rock inflicting a direct strike on a segment of the limited amount of exposed pipe much lower still. Based on its analysis, the GZA report concludes that fly rock does not pose a concern for interruption of service or the release of natural gas at the M&R station.

Algonquin would also note that blasting in proximity to a natural gas pipeline is not an unusual occurrence along its pipeline system. Algonquin utilizes industry-wide recognized procedures for ensuring the safety and integrity of steel pipelines adjacent to blasting activity. The integrity of Algonquin's pipelines are therefore protected by well-established criteria on blasting vibrations, based upon extensive research by the Pipeline Research Committee International, blasting consultants, the United States Bureau of Mines, and through Algonquin's own direct observation of existing blasting operations near its existing in-service pipelines. Furthermore, Algonquin currently owns and operates a pipeline that runs through the active Riverdale Quarry near Pompton Lakes, New Jersey. In that location, Algonquin is notified prior to each blast and its facilities are then monitored during blasting operations to ensure that no harm is done to the safety and integrity of the pipeline. The same monitoring by Algonquin personnel will occur as necessary during blasting operations conducted by the West Roxbury Crushed Stone Quarry.

FAX 781-278-5701  
<http://www.gza.net>

GZA GeoEnvironmental, Inc. (GZA) is pleased to submit this memorandum summarizing our review of the potential impacts of nearby blasting from an active quarry on the operation of the proposed West Roxbury Lateral metering and regulating (M&R) station and pipeline. This service was performed at the request of Spectra Energy Transmission, LLC on behalf of Algonquin Gas Transmission, LLC (Algonquin). References and sources used in preparation of this review are listed at the end of this memorandum. This memorandum was prepared with the assistance of Mr. James Cleveland, P.E., Mr. Bradford Roberts, P.E., and Mr. Andrew Blaisdell, and is subject to the Limitations in **Appendix A**.

To complete this scope of work, GZA completed the following steps:

- Background information describing the Quarry and the proposed M&R station and pipeline project was compiled. The results of the potential effects of the West Roxbury Crushed Stone Company (Quarry) and its operations on the M&R station and pipeline are summarized herein.
- Industry reference documents regarding quarry blasting and vibrations were researched. This is summarized and presented in **Appendix B**.
- Industry reference documents specific to protection of pipelines from blasting vibrations were researched. This is summarized and presented in **Appendix C**.
- The Quarry blast records over the last four years were reviewed. This is summarized and presented in **Appendix D**.
- The potential effects of blasting ground vibrations, if blasting is performed proximate to the proposed pipeline, were evaluated. This is summarized and presented in **Appendix E**.
- The potential effect of airborne rock (a.k.a., fly rock), if created from the blasting operations, on the above-ground portion of the M&R station were evaluated. This is summarized and presented in **Appendix F**.
- Based on the research, evaluations and review performed above, conclusions regarding the potential impacts of nearby blasting from the active Quarry on the operation of the proposed West Roxbury Lateral metering and regulating (M&R) station and pipeline were developed and summarized herein.

## BACKGROUND

Algonquin is proposing the construction and operation of a new natural gas pipeline and M&R station on Grove Street in West Roxbury, Massachusetts. A quarry that actively performs rock blasting is also located on Grove Street. The blasting operations occur at the Quarry located at 10 Grove Street, West Roxbury, Massachusetts. The location of the Quarry and the proposed locations of the M&R station and pipeline are illustrated on **Figure 1**.

## QUARRY

The approximate area of the Quarry, as measured along the crest (top) of the Quarry excavation, is approximately 33 acres. According to the Quarry General Manager, the base of the Quarry is currently approximately 420 feet below the elevation of the Quarry entrance on Grove Street. Based on MassGIS elevation data (referencing North American Vertical Datum 1988), the base of the Quarry excavation would therefore be at approximately elevation -300 feet below mean sea level. The topography surrounding the Quarry to the east is approximately 40 feet higher than the Quarry entrance, resulting in a Quarry side slope as high as 460 feet on its east side. Aerial photography indicates that the Quarry side slopes are configured of varying slope angles with benches (plateaus) to facilitate working areas and to carry the vehicular access road to the base of the excavation.

The geologic setting in the area of the Quarry and proposed M&R station and pipeline is characterized by relatively shallow bedrock, which can be observed at the ground surface along the sides of Grove Street. The bedrock lithology is mapped as Dedham Granite within the Avalon terrain, a series of related rock formations (Mass GIS). Dedham Granite is a fine-grained to very coarse-grained, alkali-feldspar granite, granite, quartz-monzonite, and granodiorite which is pink, pink and light-green, and light gray in color (Kaye, 1980).

Since 2010, the Quarry blasting has been performed by A-1 Drilling & Blasting Company (A-1). According to A-1, blasting at the Quarry is performed under a permit issued by the City of Boston Fire Department, which specifies a limit on the allowable blast-induced vibration magnitude (e.g., amplitude or peak particle velocity, PPV) at any abutting property of 1.0 inch per second (ips).

## M&R STATION AND PIPELINE

Based on GZA's review of the project plans, and Spectra's standard construction specifications, the project is planned to consist of a 16-inch-diameter natural gas pipeline entering the south side of the M&R station, and a 24-inch-diameter natural gas pipeline exiting the north side of the M&R station. Both sections of the pipe are planned to be constructed within Grove Street, at a depth of approximately 5 feet below pavement grade. The pipeline will consist of high strength Grade X-52 steel with welded connections. The pipe will be installed within an excavation and be enveloped in an engineered backfill (e.g., compacted sand or cementitious fill (a.k.a., flowable fill)) extending a minimum of 8 inches below the pipe and minimum of 6 inches on both sides of the pipe. The engineered backfill is designed to support the pipe evenly, and protect the pipe's corrosion-protection coating.

The M&R station is planned to consist of two (2) internal inspection tool (pig) barrels (one launcher, one receiver), a metering building, two exterior gas heaters, a regulating building, and above-ground and underground gas pipelines. All above-ground components will be enclosed in a security fence. The two buildings will be engineered, single-level structures with minimum 4-inch thick reinforced concrete walls and 4- to 6-inch thick reinforced concrete roof. The exterior

above-ground structures, pipes, and supports will be steel construction. The buildings, pig barrels and heaters will be supported on concrete foundations.

The piping and associated facilities are required to undergo quality control and testing during manufacturing and construction. Algonquin's quality assurance / quality control includes having its inspectors at the manufacturing facilities and on-site during all welding, coating, and backfill operations. All welds for the pipeline are required to be tested (non-destructively) by a third-party radiographic inspection company. After construction is complete, and prior to being commissioned for service, the pipeline and its associated facilities are then hydrostatically tested to pressures at least 1.5 times the planned operating pressure for eight (8) hours.

#### RELATIVE PROXIMITY OF EXISTING AND PROPOSED STRUCTURES TO QUARRY

The proposed M&R station will be located on the opposite (west) side of Grove Street approximately across from the main entrance to the Quarry, as shown on **Figure 1**. The proposed M&R station property is approximately 2.5 acres in area, and situated at approximately elevation 120 feet. The proposed pipeline will be located beneath Grove Street, which ranges between approximately elevation 120 feet and 150 feet in the general area of the Quarry.

The future extent of the Quarry excavation is not known at this time. However, for the purpose of evaluating the potential effect on the proposed facilities, a scenario was developed and evaluated, which conservatively assumes that future rock blasting could theoretically occur adjacent to Grove Street, at the nearest location on the Quarry property to the proposed pipeline.

Other existing features considered in this evaluation included the existing underground utilities located within the Grove Street right-of-way. As shown of **Figure 2**, multiple underground utilities are currently located within the Grove Street right-of-way between the Quarry and the M&R Station. Two existing water lines and one existing gas line are located between the proposed natural gas pipeline and the Quarry. The closest of these three existing utilities to the Quarry is a 12-inch-diameter water line, which ranges in distance between approximately 10 and 20 feet from the Quarry property line.

#### POTENTIAL EFFECTS OF QUARRY BLASTING ON THE M&R STATION AND PIPELINE

In general, the potentially negative effects of Quarry blasting to surrounding receptors (i.e., structures, humans, natural resources, etc.) include ground vibrations, air vibrations, hydro-geologic disturbance, and projectiles (e.g., fly rock). Air vibrations (i.e., noise or overpressure) at higher frequencies can be audibly disturbing to humans and animals, and at lower frequencies can cause rattling of walls and windows. These conditions can be a nuisance to the building occupants; however, audible disturbance is not anticipated to pose an operational concern to the proposed M&R station or pipeline. Hydro-geologic disturbance (i.e., changes in rock fracture and joint opening size and chemical/sediment content) can change water supply well yield and quality; however, the M&R station will not have an on-site water supply well.

The various structural components of the proposed M&R Station will be constructed of reinforced concrete and steel. These components are not considered more sensitive to blast-related ground vibrations than the underground piping. The proposed pipeline is closer to the Quarry than the M&R Station. Therefore, the focus of this analysis is toward the potential for ground vibrations to impact the proposed underground natural gas pipeline. The underground natural gas pipeline will be constructed approximately 5 feet below grade, and as such the discussion of fly rock is limited to the potential effects on the above-ground components of the

project. The subject of ground vibrations is discussed and presented in **Appendices B through E**. The subject of fly rock is presented in **Appendix F**.

## CONCLUSIONS

Based on our evaluations, which are presented in **Appendices B through F**, we have concluded the following:

- The vibration peak particle velocity (PPV) limit promulgated by the City of Boston under the current blasting permit at the Quarry is 1.0 ips, and is considered conservative in the protection of residential buildings.
- Underground pipelines are significantly more tolerable to vibrations than residential buildings, and at a minimum, the proposed gas pipeline can tolerate a vibration PPV of 12 ips.
- Vibrations recorded during the last four years of Quarry blasting were observed to correlate well with calculated vibration levels.
- From the blast data, we have derived site-specific scaling relations with statistical basis to obtain the relationship between PPV and blast energy.
- Quarry blasting is required by regulation to consider the protection of residences, as well as all utilities. Several utilities currently exist beneath Grove Street including a water line, which is located closer to the Quarry property than the proposed gas pipeline.
- The existing water line is closer in proximity to the Quarry than the proposed natural gas pipeline, and represents the nearest receptor to the blast for vibrations. A theoretical scenario of blasting within 5 feet of the Grove Street right-of-way would result in PPV levels 33% to 67% higher at the existing water line than at the proposed gas pipeline.
- Under this theoretical scenario and assuming a conservative set of circumstances, the vibrations at the proposed natural gas pipeline would be 1.2 ips. The resulting PPV of 1.2 ips is equal to 1/10<sup>th</sup> of the proposed gas pipeline's tolerable PPV of 12 ips, resulting in a factor of safety of 10. Other potential scenarios were considered, and would result in factors of safety of greater than 10. Ground vibrations from future blasting at the Quarry are therefore not anticipated to be disruptive or damaging to the proposed pipeline and M&R station.
- Fly rock was reported to have landed on property located on Centre Lane to the north of the Quarry in 2009. Due to the location of the proposed M&R station relative to the Quarry, and changes to the blasting operations as a result of the 2009 incident, fly-rock is not anticipated to land on the M&R station parcel. However, an analysis was made to evaluate the potential effects of a similar rock fragment striking the proposed above-ground portions of the M&R Station. Based on this analysis, a fly rock scenario similar to that reported in 2009 would potentially result in minor chipping of the concrete building exterior and minor denting of the exposed pipe resulting in some repair. However the fly rock does not pose a concern for interruption to service or release of natural gas.
- Based on our evaluation, the nearby Quarry blasting is not anticipated to have a significant negative impact on the operation of the proposed West Roxbury Lateral metering and regulating (M&R) station and pipeline.

**APPENDIX A – LIMITATIONS**Use of Report

1. GZA GeoEnvironmental, Inc. (GZA) prepared this report on behalf of, and for the exclusive use of our Client for the stated purpose(s) and location(s) identified in the Proposal for Services and/or Report. Use of this report, in whole or in part, at other locations, or for other purposes, may lead to inappropriate conclusions; and we do not accept any responsibility for the consequences of such use(s). Further, reliance by any party not expressly identified in the agreement, for any use, without our prior written permission, shall be at that party's sole risk, and without any liability to GZA.

Standard of Care

2. GZA's findings and conclusions are based on the work conducted as part of the Scope of Services set forth in GZA's Proposal for Services and/or Report, and reflect our professional judgment. These findings and conclusions must be considered not as scientific or engineering certainties, but rather as our professional opinions concerning the limited data gathered during the course of our work. If conditions other than those described in this report are found at the subject location(s), or the design has been altered in any way, GZA shall be so notified and afforded the opportunity to revise the report, as appropriate, to reflect the unanticipated changed conditions.
3. GZA's services were performed using the degree of skill and care ordinarily exercised by qualified professionals performing the same type of services, at the same time, under similar conditions, at the same or a similar property. No warranty, expressed or implied, is made.

Subsurface Conditions

4. The generalized soil profile(s) provided in our Report are based on widely-spaced subsurface explorations and are intended only to convey trends in subsurface conditions. The boundaries between strata are approximate and idealized, and were based on our assessment of subsurface conditions. The composition of strata, and the transitions between strata, may be more variable and more complex than indicated. For more specific information on soil conditions at a specific location refer to the exploration logs.
5. In preparing this report, GZA relied on certain information provided by the Client, state and local officials, and other parties referenced therein which were made available to GZA at the time of our evaluation. GZA did not attempt to independently verify the accuracy or completeness of all information reviewed or received during the course of this evaluation.
6. Water level readings have been made in test holes (as described in the Report) at the specified times and under the stated conditions. These data have been reviewed and interpretations have been made in this Report. Fluctuations in the level of the groundwater however occur due to temporal or spatial variations in areal recharge rates, soil heterogeneities, the presence of subsurface utilities, and/or natural or artificially induced perturbations. The water table encountered in the course of the work may differ from that indicated in the Report.
7. GZA's services did not include an assessment of the presence of oil or hazardous materials at the property. Consequently, we did not consider the potential impacts (if any) that contaminants in soil or groundwater may have on construction activities, or the use of structures on the property.
8. Recommendations for foundation drainage, waterproofing, and moisture control address the conventional geotechnical engineering aspects of seepage control. These recommendations may not preclude an environment that allows the infestation of mold or other biological pollutants.

Compliance with Codes and Regulations

9. We used reasonable care in identifying and interpreting applicable codes and regulations. These codes and regulations are subject to various, and possibly contradictory, interpretations. Compliance with codes and regulations by other parties is beyond our control.

Cost Estimates

10. Unless otherwise stated, our cost estimates are only for comparative and general planning purposes. These estimates may involve approximate quantity evaluations. Note that these quantity estimates are not intended to be sufficiently accurate to develop construction bids, or to predict the actual cost of work addressed in this Report. Further, since we have no control over either when the work will take place or the labor and material costs required to plan and execute the anticipated work, our cost estimates were made by relying on our experience, the experience of others, and other sources of readily available information. Actual costs may vary over time and could be significantly more, or less, than stated in the Report.

Additional Services

11. GZA recommends that we be retained to provide services during any future: site observations, design, implementation activities, construction and/or property development/redevelopment. This will allow us the opportunity to: i) observe conditions and compliance with our design concepts and opinions; ii) allow for changes in the event that conditions are other than anticipated; iii) provide modifications to our design; and iv) assess the consequences of changes in technologies and/or regulations.

## APPENDIX B – QUARRY BLASTING AND VIBRATIONS

### DISCUSSION – BLAST-INDUCED VIBRATIONS

Ground vibrations and the effects on structures are well studied and documented based on extensive research of nuclear explosions and seismic events. These studies have identified the major types of ground vibrations, and their respective propagation and attenuation rates through and along the surfaces of soil and rock, and the effects of these vibrations at various magnitudes and frequencies on structures over long distances from the energy source. Rock blasting is typically comprised of a series of blasts separated by delays to split and pulverize the rock in a controlled manner. The resulting vibration from rock blasting and the distances the vibrations travel are a function of the individual blast energies per delay rather than the total blast energy. The resulting shear and compressive body waves and Raleigh surface waves created by quarry blasting travel shorter distances, and are not as easily distinguished and evaluated to the same degree as nuclear or seismic events. However, extensive observational data has been compiled, which provides guidance in predicting rock-blasting-induced vibrations as a function of explosive charge and distance from the blast (Dowding, 1996).

The resulting vibration intensity at any distance from a blast is generally a function of the blast energy per delay, radial distance from the blast, and site-specific subsurface conditions in the area. These variables affect how vibrations transmit, attenuate, and reflect to various degrees before reaching the location of concern. Rock-blasting-induced vibrations are therefore practically and commonly measured and evaluated simply on the basis of vibration magnitude (e.g., amplitude or peak particle velocity or PPV) measured in inches per second (ips), and dominant frequency measured in cycles per second (Hertz, Hz.). The monitoring equipment commonly used to measure the vibrations is a seismograph. For rock blasting, the seismograph instrument is typically capable and set up to be triggered by the vibrations, to record the vibration time history, and to report the “peak component” PPV and associated dominant frequency in the three principal directions (X, Y, and Z, or longitudinal, transverse, and vertical components).

The empirical relationships of observed building damage were established on the “peak component” PPV (Dowding, 1996) and therefore the “peak component” PPV reported in the seismograph reports are referenced herein when describing PPV. The peak “true vector sum” of the three component PPV levels can also be used to quantify vibration intensity; however, deriving the “true vector sum” can be a time-intensive and iterative exercise. The “maximum vector sum” is sometimes used for quantifying vibrations for regulatory purposes. The “maximum vector sum” combines the peak component PPVs for ease of use; however neglects that the peak component PPVs typically occur at different times on the vibration time history, and are therefore inaccurate and not recommended for use in evaluating vibrations.

Blast-induced PPV is typically controlled by designing the blast based on scaling relations relative to the nearest sensitive receptor(s), (i.e., typically buildings and/or utilities), and/or monitoring the vibrations during the blast at the receptor location(s). Scaling relations take into account the charge per delay and distance from the blast and degree of confidence in estimating the maximum PPV. In addition to the charge per delay and distance from the blast, vibration PPV induced by rock blasting can also be a function of a number of other components of the blast design (i.e., total charge, blast pattern, stemming depth, hole spacing, etc.), overburden, bedrock geology, and topography, all of which are unique to each blast. Accordingly, the site-specific scaling relationship can be evaluated using blast vibration data specific to each site, and the site-specific relationship is well-suited to predict PPV from future blasts at the same general location. This evaluation was performed as part of this study and the findings are presented in **Appendix D**.

Publications and industry guidelines present scaling relations, which in conjunction with the blaster's experience, provide a predictive methodology for determining the maximum charge per delay based upon the allowable PPV and distance to the sensitive receptor at each blast location (Hopler, 1998). The published scaling relations are based upon statistical analysis of thousands of recorded quarry blast vibrations. The scaling relation takes the form:

$$PPV = A (R/\sqrt{W})^B$$

Where:

PPV = Allowable peak particle velocity at the sensitive receptor (inches per second)

A = Variable based upon scaling relation referenced.

R = Radial distance between blast and sensitive receptor (feet)

W = Charge weight per delay (pounds)

B = Variable based upon scaling relation referenced.

The term  $(R/\sqrt{W})$  is known as the "scaled distance".

The variable A is a function of the site specific conditions, as well as the desired degree of confidence that the resulting PPV is equal to or below the calculated PPV. The upper bound value of "A" based on the last year of blast reports, is presented in **Appendix D**. The variable B is taken as -1.6 based on a majority of publications on the subject (Siskind, et al., 1980; Konya, 1991).

#### DISCUSSION – IMPLICATIONS OF GROUND VIBRATIONS

The level of vibration a receptor (e.g., building, structure, utility, etc.) can tolerate is a function of the PPV, frequency, and duration of the vibrations, along with the definition of "tolerable" for that receptor. The total duration of rock-blast-induced vibrations is typically not longer than one second, and the maximum peak PPV is often not repeated, such that duration is typically not considered in rock-blast-induced vibrations.

The U.S. Bureau of Mines (USBOM 8507) proposed vibration PPV levels relative to the protection of residential dwellings from coal mine blasting as a function of vibration frequency (Siskind, et al., 1980). The term "protection" refers to controlling the racking or shifting of a timber-framed residential building, based on observed cracking of concrete and interior and exterior finishes. The USBOM 8507 criteria do not address other types of buildings or above- and below-ground infrastructure. However, USBOM 8507 is widely accepted by practitioners and regulatory authorities as guidance for evaluating the magnitude of blast-induced vibrations for buildings in general (527 CMR 13).

*"Allowable limits of airblast and ground vibrations [USBOM 8507] are based, with a conservative factor of safety, upon extensive government, university, and engineering research which has established the amount and character of vibration so as to prevent damage and to insure the safety of the public and protection of property adjacent to the blast area." (527 CMR 13.09(a))*

The Office of Surface Mining (OSM) limit for residences near long-term, large-scale surface mine operations at distances of 300 to 5,000 feet (Hopler, 1998) is 1.0 ips, for any frequency. According to A-1 Drilling and Blasting, the Quarry's blasting operations are permitted by the City of Boston, with a PPV limit of 1.0 ips for any frequency similar to the OSM limit. This PPV limit of 1.0 ips is more restrictive than the USBOM 8507 limits within the majority range of

blast-induced frequencies. The USBOM 8507 (527 CMR 13) limits and the OSM (Quarry permit) limits are illustrated on **Figure D1**.

**Table B1** provides a compilation of vibration limits obtained from a variety of references to help illustrate the range of tolerances to vibrations by structures, materials, and humans (Bender, 2007).

**Table B1**

In order to provide some idea of what various PPV intensities represent, their effect on various structures and materials is contained in the following listing. These have been documented by researchers and organizations as referenced. Because of the many variables that could be encountered in the field, this listing should not be used to establish limits or be considered as the absolute point where the effect will always occur. To do so would also require consideration of frequencies. PPV units are inches per second.

PPV	Application	Effect	Reference
600	Explosive inside concrete	Mass blowout of concrete	j
375	Explosive inside concrete	Radial cracks develop in concrete	j
200	Explosive inside concrete	Spalling of loose/weathered concrete skin	j
> 100	Rock	Complete breakup of rock masses	a
100	Explosive inside concrete	Spalling of fresh grout	j
100	Explosive near concrete	No damage	l
50 - 150	Explosive near buried pipe	No damage	n
25 - 100	Rock	Tensile and some radial cracking	a
40	Mechanical equipment	Shafts misaligned	d
25	Explosive near buried pipe	No damage	o
25	Rock	Damage can occur in rock masses	c
10 - 25	Rock	Minor tensile slabbing	a
24	Rock	Rock fracturing	b
15	Cased drill holes	Horizontal offset	d
> 12	Rock	Rockfalls in underground tunnels	b
12	Rock	Rockfalls in unlined tunnels	g
< 10	Rock	No fracturing of intact rock	a
9.1	Residential structure	Serious cracking	b
8.0	Concrete blocks	Cracking in blocks	d
8.0	Plaster	Major cracking	h
7.6	Plaster	50% probability of major damage	g
7.0 - 8.0	Cased water wells	No adverse effect on well	m
> 7.0	Residential structure	Major damage possible	e
4.0 - 7.0	Residential structure	Minor damage possible	e
6.3	Residential structure	Plaster and masonry walls crack	b
5.44	Water wells	No change in well performance	k
5.4	Plaster	50% probability of minor damage	g
4.5	Plaster	Minor cracking	h
4.3	Residential structure	Fine cracks in plaster	b
> 4.0	Residential structure	Probable damage	f
2.0 - 4.0	Residential structure	Plaster cracking (cosmetic)	e
2.8 - 3.3	Plaster	Threshold of damage (from close-in blasts)	g
3.0	Plaster	Threshold of cosmetic cracking	h
1.2 - 3.0	Residential structure	Equals stress from daily environmental changes	i
2.8	Residential structure	No damage	b
2.0	Residential structure	Plaster can start to crack	d
2.0	Plaster	Safe level of vibration	g
< 2.0	Residential structure	No damage	e
< 2.0	Residential structure	No damage	f
0.9	Residential structure	Equivalent to nail driving	i
0.5	Mercury switch	Trips switch	d
0.5	Residential structure	Equivalent to door slam	i
0.1 - 0.5	Residential structure	Equates to normal daily family activity	i
0.3	Residential structure	Equivalent to jumping on the floor	i
0.03	Residential structure	Equivalent to walking on the floor	i

**APPENDIX C – VIBRATIONS AND PIPELINES**

The various structural components of the proposed M&R Station will be constructed of reinforced concrete and steel, and not considered more sensitive to blast-related ground vibrations than the underground piping. The proposed pipeline is approximately 100 feet closer to the Quarry than the M&R Station. Therefore, the focus of this analysis is toward the potential for ground vibrations to impact the proposed underground natural gas pipeline.

**PROPOSED PIPELINE**

The proposed pipeline will be installed according to Spectra standard details. We understand this includes a minimum of 6 inches of bedding material laterally between the piping and trench sidewalls and a minimum of 8 inches of bedding material between the piping and base of the trench. Bedding material beneath and around the pipe will consist of either sand or controlled density fill.

**EXISTING UTILITIES**

The proposed gas pipeline will be installed along Grove Street. Within the length of Grove Street that abuts the Quarry, the proposed gas pipeline will be located approximately 30 feet from the Quarry property line. There are multiple existing utilities beneath Grove Street, including a water main line and a sanitary sewer line, both of which are closer to the Quarry property line than the proposed gas pipeline in this area. The existing water line is closest to the Quarry, ranging between 5 and 20 feet away from the Quarry property line. The age, condition, depth, and material of the existing utilities are not known.

**PEAK PARTICLE VELOCITY AND VIBRATION IN PIPELINES**

Historically, pre-blast prediction and subsequent measurement of PPV has been the primary tool to predict and measure vibrations from a blast. The PPV can be easily measured by portable seismographs. Several references have been reviewed that correlate PPV to buried pipelines. The available references and corresponding PPV values are presented in the table below.

**Table C1**  
**Pipeline PPV Limits**

PPV (ips)	Application / Effect	Reference
50-150	Explosive near a buried pipe with no damage	Siskind, D.E. & Stagg, 1993 (Compiled in Bender, 2007)
25	Explosive near a buried pipe with no damage	Oriard, 1980 (Compiled in Bender, 2007)
>12-15	Predicted PPV of an explosive near buried pipe that resulted in no damage	Bender, 1981
12	Vibration limit of pipeline trench parallel to existing high-pressure gas lines	ISEE Handbook
10	Blasting 50' from buried pipe with no loss of pipe integrity	US Bureau of Mines (Siskind, 1994)
5-10	Any steel buried pipe under any conditions or use the calculations for allowable PPV based on the allowable stress of pipe	Pipeline Engineering Journal, 2009 pg. 260-262

### PIPE STRESSES AND VIBRATIONS

Studies have been performed and published describing the resistance of buried pipelines to blast-induced vibrations. These studies provide correlations between scaled distance with pipe bending and hoop stresses. The studies have concluded that pipe stresses are more accurately predicted based upon scaled distance than indirectly through PPV (Esparza, 1991). A scaled distance of 10, which corresponds to a PPV of 12.5 to 15 ips, has been considered conservative for buried pipelines.

Calculations to evaluate the reserve strength within pipelines to resist the applied energy from blasts allow designers to analyze site-specific and project-specific tolerance of a pipeline to stresses caused by vibrations. The project-specific variables include pipe properties (diameter, wall thickness, and yield strength), operating pressure, blasting energy, and the blast distance from the pipe. Based on the equation proposed by Esparza, 1981, the reserve strength within the 16-inch-diameter transmission gas pipeline operating at full pressure is 35,000 psi. This amount of reserve strength within the pipe can resist the stresses induced by ground vibrations in excess of 100 ips.

Based on the above references, and understanding the details of the pipe construction, installation, and operating pressure, we consider 12 ips to be a conservative PPV limit for the protection of the proposed West Roxbury Lateral pipeline.

**APPENDIX D – REVIEW OF QUARRY BLAST REPORTS**

As part of this study, GZA evaluated the historical documented blast designs and levels of blast-induced vibrations at the Quarry. GZA obtained 139 blast reports from the Quarry spanning March 10, 2010 through December 12, 2013. The blast reports describe the blast design details and vibrations recorded at nearby residential areas. Due to the amount of blast data, GZA reviewed of the 139 blast vibration results and more closely evaluated the most recent 12 months of blast reports, comprising 26 blasts.

**LAST FOUR YEARS OF BLAST DATA**

GZA reviewed the maximum vibration monitoring results of the 139 blasts performed between 2010 and 2013. GZA compared the maximum recorded PPV for each blast to the Quarry's permitted allowable peak particle velocity (PPV) limit of 1.0 ips and the U.S. Bureau of Mines suggested vibration limits for buildings (USBOM 8507). The reported PPV levels represent the maximum recorded PPV and associated frequency per blast. A-1 monitored the blast vibrations using a seismograph that recorded the vibration time history, peak component PPV, and associated frequency for each of the X, Y, and Z directions. These 139 peak component PPVs are shown below.

**Figure D1**

The maximum PPV of each of the 139 blasts spanning 2010 to 2013 fell within the permitted PPV limit of 1.0 ips. All but one of the 139 recorded peak PPVs were also within the USBOM 8507 criteria. The blast in question, Blast # 08-1, occurred June 26, 2013 and is among the blasts more closely reviewed in the followed paragraphs. This review suggests that the Quarry blasting vibrations have been effectively maintained within the permitted and limit over the last four years.

LAST 12 MONTHS OF BLAST DATA

GZA evaluated the most recent 12 months of A-1's reports of the Quarry blasting and made the following observations:

- Blast 08-1 resulted in a recorded vibration of 0.86 ips at 16 Hz. This recorded vibration was within the permitted limit of 1.0 ips. Blast 08-1 was the only blast with a recorded maximum vibration level that exceeded the USBOM 8507 criteria of 0.84 ips for that frequency.
- A-1 calculated the scaled distance and maximum energy per delay for each blast based on the nearest residence to the blast. The scaled distances of the 26 blasts ranged between 32 and 70, averaging 49. It is our opinion that the scaling relations method in conjunction with vibration monitoring remains the generally accepted industry standard for predicting and controlling the magnitude of rock-blasting-induced vibrations.
- A site-specific scaled distance plot is presented below for all of the recorded PPV data in the last year. The red line represents the upper bound limit of PPV based on the measured data. The correlated A-value upper bound limit for the last 12 months of blast vibration results is 500.
- Review of the last 12 months of blast energies and respective measured PPVs and distances illustrate that the Quarry geology propagates and attenuates blast-induced vibrations consistent with the published "scaled distance" equations at other quarry operations.

Figure D2

**APPENDIX E – BLASTING PROXIMATE TO THE PROPOSED PIPELINE**

The portion of the proposed pipeline route closest to the Quarry is along a section of Grove Street shown on **Figure 2**. That portion of the Quarry is currently used as a haul road and stockpile area. For the purposes of this evaluation, we have considered a scenario that the Quarry will move the stockpile and haul road and blast along the property line abutting Grove Street. Under such a scenario, we further assumed that the blasting would take place as close as 5 feet from the property line in this area. This 5-foot setback is conservative in that it only leaves room to walk around the Quarry, and does not factor any regulatory setback requirements that may be imposed by the City of Boston, the Mine Safety and Health Administration, Occupational Safety and Health Administration, or other operational considerations by the Quarry operator (i.e., to maintain vehicular access to the rear of the Quarry property, etc.) any of which would likely require more than a 5-foot setback.

Assuming blasting did take place near Grove Street, the nearest sensitive receptor would be the existing water line. Massachusetts State Regulation 527 CMR 13.09(o) requires that prior to blasting in the vicinity of utility lines or rights-of-way, the blaster shall notify the appropriate utilities in advance of blasting, and obtain a Dig-Safe number. In doing so the blaster would find the water line markings in the road and be required under 527 CMR 13.09(k) to conduct a blast analysis. The blast analysis shall include all of the overall factors affecting the blasting operations, considering adjacent area structure(s), building(s), utilities, including gas and water supply lines within 250 feet of the center of the blast site and other underground objects that might be damaged by the effects of a blast.

Per 527 CMR 13, the blaster is required to maintain blast vibrations below the USBOM 8507 or 1.0 ips limits. This scenario assumes that the blaster based his blast design around a maximum allowable PPV of 2.0 ips (USBOM 8507 limits, above 40 Hz) at the water line:

**Location along Grove Street where the proposed gas pipeline would be closest to the Quarry (pipeline station 218+50).**

**Blast is designed using the scaled distance approach based on the nearest structure / utility (e.g., the existing water line)**

Distance from blast to water line: 25 feet

- Maximum allowable PPV at water line: 2.0 ips (assume using highest PPV limit on the USBOM 8507 curve, rather than the currently permitted PPV limit of 1.0 ips)
- Scaled distance for blast design: 31
- Maximum charge / delay: 0.66 Lb.

Resulting PPV at water line: 2.0 ips

Distance blast to the proposed gas pipeline: 35 feet

**Resulting upper bound PPV at the proposed gas pipeline: 1.2 ips**

Conservative upper bound PPV for the proposed West Roxbury gas pipeline = 12 ips (Refer to Appendix C).

**Minimum Factor of Safety for the proposed Gas Pipeline (12 / 1.2) = 10.**

If the water line is subject to the City of Boston permitted PPV limit of 1.0 ips, the resulting upper bound PPV at the proposed gas pipeline would be 0.6 ips, resulting in a minimum factor of safety of 20 for the proposed gas pipeline.

This scenario concludes that if future blasting occurs adjacent to Grove Street, the proposed gas pipeline will be subject to only nominal vibrations, with a conservative factor of safety of at least 10.

The water line is located approximately 20 feet from the Quarry property line along the stretch of Grove Street in the above scenario. The existing water line is closer to the Quarry property line and the proposed gas pipeline is further away from the property line at other locations along this stretch of Grove Street. Other theoretical blast scenarios at other locations near Grove Street would therefore conclude with lower ground vibrations being experienced at the proposed gas pipeline.

**APPENDIX F – POTENTIAL EFFECTS OF FLY ROCK TO THE PROPOSED M&R STATION**

The underground natural gas pipeline will be constructed approximately 5 feet below grade, and as such the discussion of fly rock is limited to the potential effects on the above-ground components of the project.

Blasting is fundamentally intended to split, pulverize and mobilize the rock mass in a controlled fashion. When performed properly, the resulting rock particles move horizontally, away from the rock face resulting in a stockpile at the base of the rock face. There is no benefit to the Quarry in spreading the blast rock over a large area, as this will result in a loss of rock and require greater effort collecting the blast rock for processing.

All of the rock faces of the Quarry point inward to the Quarry property. In the event that blast rock particles are projected beyond the intended collection area at the base of the rock face, the blast rock will still be contained within the Quarry. There are rare circumstances where blast rock will be projected in a steep angle. This is often caused by inadequate blast design and improper stemming. In such an instance, the resulting blast rock will still be primarily directed within the Quarry.

In the very rare event that blast rock is projected to the side or behind the rock face, the rock could theoretically leave the Quarry property. It is our understanding that such an event was reported in 2009 by the property owner of 19 Centre Lane (Ertischek, 2009). The property at 19 Centre Lane abuts the Quarry. Based on aerial photography and Mass GIS, the shared property line is located 200 feet from the nearest Quarry face. According to one news report, blasting was taking place in the northwest portion of the Quarry at the time. The article reported that the fly rock created imprints in the lawn and dislodged rocks from a landscape wall.

It is our understanding that immediately following this reported event, the Quarry implemented modifications in the blasting operations to reduce the potential for fly rock, and since incorporating these changes, fly rock has not been reported by abutters.

The M&R station is planned to consist of two (2) internal inspection tool (pig) barrels (one launcher, one receiver), a metering building, two exterior gas heaters, a regulating building, and above-ground and underground gas pipelines. All above-ground components will be enclosed in a security fence. The buildings will be engineered, single-level structures with minimum 4-inch thick reinforced concrete walls and 4- to 6-inch thick reinforced concrete roof. The exterior above-ground structures, pipes, and supports will be steel construction. The buildings, pig barrels and heaters will be supported on concrete foundations. All sensitive M&R Station piping, instruments and components will be located inside of the reinforced concrete buildings.

A fly rock scenario was evaluated at the proposed M&R station parcel with respect to the building and the exposed above-ground piping. Information produced by the U.S. Naval Ship Research and Development Center (CIRIA/UEG, 1989) provides the results of test missiles similar to the size, mass and velocity estimated from the 2009 reported fly rock event. The missiles were observed to cause chipping of less than 1 inch deep in the concrete face, with no damage to the back side of the concrete.

The same dynamic forces were used to evaluate the potential of above-ground piping to dent or puncture the exposed portions of the pipeline. Calculations based on the pipe diameter, thickness, and steel strength, indicate that a dent may be formed on the order of 2 inches in depth or less.

However, the pipe's resistance to puncture is over 10 times the applied force of the fly rock. (Fuglem, 2001).

Based on this analysis, a fly rock scenario similar to that reported in 2009, would potentially result in minor chipping of the concrete building exterior and minor denting of the exposed pipe resulting in some repair. However the fly rock does not pose a concern for interruption to service or release of natural gas.

UNITED STATES OF AMERICA  
BEFORE THE  
FEDERAL ENERGY REGULATORY COMMISSION

---

Algonquin Gas Transmission,  
LLC  
Algonquin Incremental Market Project

---

Docket No. CP14-96-000  
PF13-16-000

**MOTION TO INTERVENE OF FOOD & WATER WATCH, STOP THE  
ALGONQUIN PIPELINE EXPANSION, THE SIERRA CLUB, LOWER HUDSON  
GROUP, BETTER FUTURE PROJECT, CAPITALISM V. CLIMATE AND  
FOSSIL FREE RHODE ISLAND**

On March 18, 2014, the Federal Energy Regulatory Commission (“FERC”) issued a notice of application under § 7 of the Natural Gas Act, 15 U.S.C. § 717f, and § 157 of FERC’s regulations, 18 C.F.R. § 157.1 et seq., for the proposed Algonquin Incremental Market Project (“Project”), FERC Docket No. CP14-96-000. As stated in FERC’s notice of application, Algonquin Gas Transmission LLC (“Algonquin”) seeks, among other things, authorization to construct up to 42-inch diameter pipelines and all appurtenant facilities as well as stations in New York, Connecticut, Rhode Island and Massachusetts. In accordance with Rule 214 of FERC’s Rules of Practice and Procedure, 18 C.F.R. § 385.214, Food & Water Watch, Stop The Algonquin Pipeline Expansion, the Sierra Club, Lower Hudson Group, Better Future Project, Capitalism vs. Climate and Fossil Free Rhode Island (“Intervenors”) respectfully move for the Commission to grant intervention in the above-captioned matter. While Intervenors have included some substantive comments in this motion, Intervenors may also submit more substantive comments at a later date.

**I. COMMUNICATION AND CORRESPONDENCE**

Service in this proceeding should be made upon, and communications should be directed to the following persons:

Alex Beauchamp, Northeast Region Director  
Food & Water Watch  
68 Jay Street, Suite 713  
Brooklyn, New York 11201

## **II. INTERVENORS**

Food & Water Watch is an international non-profit organization that works to ensure that the food, water, and fish that humans consume is safe, accessible, and sustainable. To that end, Food & Water Watch promotes policies that will maintain the environmental integrity of our drinking water supplies, rather than put them at risk of degradation. Food & Water Watch has nearly 144,000 supporters in the four states where the Project is proposed, including in Fairfield, Hartford, Middlesex, New Haven and New London

counties, Connecticut: 12,000 supporters, in Putnam, Rockland and Westchester counties, New York: 7,300 supporters, in Suffolk and Bristol counties, Massachusetts: 4,400 supporters and in Providence County, Rhode Island: 1,900 supporters.

Sierra Club is a non-profit organization founded by legendary conservationist John Muir in 1892. It is now the nation's largest and most influential grassroots environmental organization with 64 chapters and approximately 2 million members and supporters nationwide. The Sierra Club's Lower Hudson Group has approximately 4,000 members in Rockland, Westchester, and Putnam counties.

Stop The Algonquin Pipeline Expansion is a grassroots group of approximately 30 members in Westchester, Putnam and Rockland counties, who also work in coalition with Connecticut, Rhode Island and Massachusetts groups to oppose the Project. An online petition initiated by SAPE opposing the Project has nearly 20,000 signatures.

Better Future Project is a Cambridge-based non-profit that seeks to build a grassroots movement to rapidly shift society beyond coal, oil and gas by coordinating programs like 350 Massachusetts, Climate Summer and Mothers Out Front. The group is composed of approximately 7,000 members.

Capitalism vs. the Climate organizes non-hierarchically and takes direct action in solidarity with communities most impacted by the climate crisis. We're members of Rising Tide North America. We started in 2012 in Connecticut, and our membership consists of 17 volunteers and supporters.

Fossil Free Rhode Island spurs real action on runaway climate change, which poses a mortal threat to the biosphere of which the human species is a part. We seek to redress inequitable distribution of environmental burdens of both local and global impact by opposing extreme energy projects such as the Keystone XL Pipeline, fracking, and mountaintop removal mining. We believe that all institutions that serve the public good should divest from fossil fuels. The group consists of about 30 members.

### **III. GROUNDS FOR INTERVENTION**

The Intervenor's oppose the Project and are extremely concerned about Algonquin's application. Members of these organizations and the constituents they serve live in the areas that will be directly impacted by the Project. The pipeline and its associated facilities will cut through four states, under the Hudson River, near an active quarry in the City of Boston, and through a number of sensitive watersheds and public lands. Intervenor's raise environmental, public health, and safety concerns on behalf of their members along the Project right of way, in the impacted communities, and across the proposed route.

#### **No Need For the Project**

As a threshold matter, Intervenor's question the necessity of the Project. We are

concerned that as domestic natural gas demand and prices remain low, the expanded capacity requested under this Project will be used to supply gas from the Marcellus Shale to proposed export facilities. The communities and our members impacted by this proposed pipeline infrastructure will not see environmental or economic benefits as a result of the Project. “Specifically, the Project will create additional pipeline capacity from the Ramapo, New York receipt point on Algonquin’s system to various Algonquin city gate delivery points in Connecticut, Rhode Island, and Massachusetts.”<sup>1</sup>

### **Environmental Impacts Resulting from Fracking**

This pipeline will carry gas from the Marcellus Shale, drilled using the technique known as hydraulic fracturing (“fracking”). The Project is designed to provide gas produced from the Marcellus Shale to New England markets. At a time when there is mounting evidence of the dangers inherent to fracking for natural gas, and given that the long-term productivities of Marcellus Shale gas wells are unknown, it is unwise to approve a proposal that will encourage such a practice in fragile ecosystems and populated areas. FERC must examine in its review of the proposed pipeline all secondary and cumulative impacts the Project will have, including encouraging the expansion of fracking in the region.

### **Connection to Existing or Potential LNG Ports**

Algonquin’s application states that the Project is being proposed to deliver gas to markets in New England; however, the proposed Project is both a product of development in the Marcellus Shale and a likely catalyst for further gas development by providing an avenue to export that gas to the international market. “The Algonquin natural gas transmission system connects with Texas Eastern’s facilities in New Jersey and extends approximately 250 miles through New Jersey, New York, Connecticut, Rhode Island and Massachusetts where it connects to Maritimes & Northeast (“M&N”) Pipeline.”<sup>2</sup> According to Spectra Energy Partners LP’s 10K report filed with the US Securities and Exchange Commission for 2013, “M&N US is connected to the Canadian portion of the Maritimes & Northeast Pipeline Limited Partnership, which is owned 78% by Spectra Energy.”<sup>3</sup> The AIM expansion project suggests that the gas may be exported to Canada and overseas.

The Project has the potential to make gas available for transport to LNG export facilities on the East Coast and in Canada. Three LNG facilities: the Northeast Gateway Deepwater Port and the Neptune Deepwater Port, both off of Gloucester, Massachusetts, and the Distrigas terminal in Boston Harbor are idle for lack of LNG import activity;

<sup>3</sup> Ibid., p.9.

these facilities could potentially be converted to export facilities.<sup>4</sup> The “Canaport” LNG facility in New Brunswick, Canada has been given permission to export gas via tanker as of November, 2013.<sup>5</sup> Pieridae Energy Canada is looking to site an LNG export facility in Nova Scotia.<sup>6</sup>

### **Exporting Gas Hurts National Economy, Not in Public Interest**

The Energy Information Administration (“EIA”) predicts the US will be a net exporter of Liquefied Natural Gas (“LNG”) by 2016. The U.S. Department of Energy (“DOE”) is currently reviewing applications for LNG export authorization. If all were approved this would lead to an export capacity of over 28 billion cubic feet (“Bcf”) per day, approximately 42 percent of what the U.S. produced daily in 2013.<sup>7</sup> The EIA predicts that an average of 63 percent of exported LNG will come from new gas drilling, but this could rise to 71 percent by 2035.<sup>8</sup>

An EIA study found considerable impacts from LNG exports, and researchers at Purdue University and other institutions have confirmed the EIA findings. Impacts that do not make this Project in the public convenience and necessity include:

- slightly depressed Gross Domestic Product (“GDP”): “Using the natural gas in the U.S. is more advantageous than exports, both economically and environmentally,”
- increased domestic price of natural gas—as much as 47%,
- higher electricity rates— as much as 7.2%
- increase in greenhouse gas emissions by as much as 12%,
- decreases in the manufacturing sector as much as 3.1%,
- fracking boom in shale formations,

<sup>8</sup> Mantius, Peter. “Obama Administration Said No to Full Environmental Study of LNG Exports”. *DC Bureau*. Apr 22 2013. <http://www.dcbureau.org/201304228396/natural-resources-news-service/obama-administration-says-no-to-full-environmental-study-of-lng-exports.html>

- major U.S. wealth transfer from consumers and energy-dependent industries to the natural gas industry and its investors<sup>9</sup>

Expanding the infrastructure to carry natural gas to export facilities is not in the best interest of the American people. As this Project will potentially allow Algonquin to transport more gas to proposed export facilities, the environmental, economic, and public health and safety impacts of exporting US natural gas must be included as a cumulative impact of this Project in the National Environmental Policy Act (“NEPA”) review.

### **Hudson Crossing Near Indian Point Nuclear Plant and Earthquake Fault Lines**

The Project includes the addition of a 42” diameter, high-pressure gas pipeline to the three already existing pipelines that cross under the Hudson River from Rockland County to Westchester County. The new pipeline may intersect underground with proposed high voltage power lines in close proximity to the Indian Point nuclear power plant’s 40 years of spent nuclear fuel rods and the Ramapo and Stamford earthquake fault lines.

Although Algonquin proposes “horizontal directional drills of 0.7 miles crossing the Hudson River,” should they encounter problems with that type of drilling, they may revert to more environmentally damaging dredging of the Hudson.<sup>10</sup>

### **Proximity to Active Quarry in Boston**

Residents of West Roxbury have raised concerns about the proximity of the Project to an active quarry, the West Roxbury Crushed Stone Company. Property owners adjacent to the quarry are already dealing with damage from routine blasting and facing potential soil contamination from proposed containment ponds. The West Roxbury Civic and Improvement Association also raised concerns about the lack of public hearings or permitting before the purchase of four acres for a new metering and regulating station.<sup>11</sup>

### **Methane Leakage and Impact on Climate Change**

Residents along the AIM project’s route are concerned about fugitive methane emissions from the pipeline, compressor stations, and metering and regulating stations. There are documented problems with valves that Spectra energy uses in gas infrastructure projects. The Pipeline Hazardous Materials Safety Administration (PHMSA) issued Spectra Energy CEO Greg Ebel a ‘final order’ and civil penalty of \$134,500 related to various

<sup>10</sup> Application, Vol. 1, p. 7, 2/28/14: 201402285269 (291651971).pdf

<sup>11</sup> Matt Robare, “Residents, Politicians Concerned Over Quarry Plans,” <http://www.wickedlocal.com/x1304804017/Residents-politicians-concerned-over-quarry-plans>, “Residents concerned over gas pipeline through West Roxbury, Westwood,” <http://www.wickedlocal.com/article/20131223/NEWS/312239658>

violations across several states.<sup>12</sup> Issued in this order, the company was cited for failure regarding valve inspection.

“Trillium Asset Management, with over \$1 billion in assets under management, has filed a shareholder resolution requesting a report from Spectra Energy’s Board of Directors on its fugitive methane emissions.<sup>13</sup>

Methane emissions from shale gas infrastructure projects are recognized as a significant contributor to climate change.<sup>14</sup> Methane 86 times more powerful than CO<sub>2</sub> as a greenhouse gas over 20 years.<sup>15</sup> Therefore, shale gas infrastructure with methane leakage of up to 9% is undermining efforts to slow climate change.<sup>16</sup>

### **Inadequate Oversight**

Regulation of pipeline safety is not only severely fragmented among dozens of federal, state, and local agencies, but is severely under-resourced in terms of personnel and funding. When regulators are incapable of coping with the existing hazards and damage to water safety and quality, it is extremely unwise to tolerate additional hazardous activities.

There have been a number of pipeline disasters in the current decade alone. A 2010 natural gas line explosion in San Bruno, California killed eight people and damaged or destroyed dozens of homes. Also in 2010, a pipeline oil spill caused more than \$1 billion in damage to the Kalamazoo River.

Jeffrey Wiese, the leading official in oil and gas pipeline safety, admitted to a convention of compliance officers that his agency, the Pipeline and Hazardous Materials Administration (“PHMSA”), has limited enforcement power over safety rules.<sup>17</sup> The PHMSA’s budget for pipeline safety has not increased for the past three years, although thousands of miles of new pipeline have been built. The Obama administration sought additional funding for pipeline safety enforcement, but Congress has refused to provide it pursuant to the sequester. According to Wiese, it is no longer “viable” to use the regulatory process to respond to dangerous conditions, because it takes too long.

<sup>16</sup> Jeff Tollefson, “Methane Leaks Erode Green Credentials of Natural Gas,” 1/2/13, <http://www.nature.com/news/methane-leaks-erode-green-credentials-of-natural-gas-1.12123>

<sup>17</sup> Stern, Marcus and Sebastian Jones. “Exclusive: Pipeline Safety Chief Says His Regulatory Process Is ‘Kind of Dying’.” InsideClimate News, Sep 11, 2013. <http://insideclimatenews.org/news/20130911/exclusive-pipeline-safety-chief-says-his-regulatory-process-kind-dying>

California Congress member Jackie Speier said that “The [energy] industry has a lock on PHMSA” and on Congress, causing public interests to be “dramatically watered down”—for example, the oil and gas industry has prevented the institution of requirements of remote shutoff valves for pipelines.<sup>18</sup>

Many hazardous materials are carried in pipelines, and over half of the pipeline now in service has been in use for three or four decades, making it likely that at least some areas are affected by corrosion and other sources of failure. Yet, PHMSA has only 135 inspectors, and there are 2.6 million miles of pipeline already in service. Since 2006, PHMSA and cooperating state agencies have inspected only one-fifth of the existing pipeline capacity.

Although Congress increased the maximum fines in 2011, Wiese said that a \$2 million civil penalty is irrelevant to a major multinational corporation, and does not deter industry practices that could lead to major accidents. Strengthening regulation is difficult: adoption of a new pipeline rule can take as long as three years. Wiese announced that PHMSA is setting up a YouTube channel to persuade industry to voluntarily adopt better safety practices. However, American Petroleum Institute spokesman Brian Straessle said that the pipeline infrastructure is protected by “strong standards in place,” and that the industry has financial incentives to prevent incidents and protect the environment.

Approving the AIM project would merely add additional potential hazards while the overburdened PHMSA is already struggling to protect public safety.

### **Health Risks Related to Air Emissions**

Residents throughout the entire region will be impacted by air emissions from the infrastructure related to the AIM Project. The application states “Algonquin will modify six existing Algonquin compressor stations to add an additional 81,620 hp to its pipeline system as part of the AIM Project. This increase in horsepower will be achieved with the installation of six new compressor units.”<sup>19</sup>

Air emissions from compressor stations include benzene, toluene, formaldehyde and many other chemicals. The existing emissions and the estimated increase in emissions is not clearly delineated in the application and some of the information about existing equipment is not available to the public. The compressor station expansions at Stony Point and Southeast, NY, Cromwell and Chaplin, CT and Burrillville, RI are sited in regions currently considered non-attainment areas for a variety of emissions. The section about the Oxford, CT compressor station seems to be omitted from the application. Residents along the route of the AIM Project have serious concerns about the increased emissions associated with the expansion and resulting health impacts.

Health impacts associated with compressor station emissions include nosebleeds, visual

---

<sup>18</sup> *Ibid.*

<sup>19</sup> Spectra Energy Resource Report 9, p.9-2

impairment, neurological and respiratory problem, leukemia, aplastic anemia, lung, liver, kidney and cardiovascular disease. Children, pregnant women, elderly and health-compromised populations are particularly vulnerable.<sup>20</sup>

Cumulative impacts of the entire proposal should be assessed and a formal Health Impact Assessment (HIA), as outlined by the Centers for Disease Control, should be conducted and included in the Environmental Impact Statement. Baseline testing of air emissions in regions surrounding the compressor stations should be conducted prior to permitting by the state agencies.

### **Sedimentation**

Sedimentation, erosion, and potential contamination impacts to water bodies and wetlands during construction will lower water quality. Additionally, severe compaction of the soil will reduce the ability for water to recharge groundwater supplies. Intervenors note that locating the Project on these lands will create a new conduit for water through the gravel surrounding the pipeline, altering the hydrologic pattern of the watershed lands. Water will run parallel with the new pipeline instead of recharging aquifers and river ecosystems, degrading the quality and quantity of water available to residents.

### **Environmental Impacts to Blue Mountain Park**

County parkland in which significant environmental impacts of the Project are clear is the 1,538-acre Blue Mountain Reservation in Westchester County. Protection of the park is important both ecologically and economically to the area.

The serious degradation of ground and surface waters, publically owned lands, and forest habitats associated with this Project make it potentially dangerous and not in the public convenience and necessity.

## **IV. CONCLUSION**

Intervenors have considerable interest and are invested in protecting the environmental and public health of the areas in which the Project is proposed to be built. Intervenor's intervention in the Project application process is in the public interest as required by 18 C.F.R. §385.214(b)(2)(iii). No other party in this proceeding will be able to adequately protect these interests. Accordingly, Intervenors have a direct and substantial interest in the outcome of this application process.

For the reasons set forth above, the Intervenors respectfully request that this Motion to Intervene be granted and that they be permitted to participate, with the full rights of a party, in the above-captioned proceeding before FERC.

Motion to Intervene Food and Water Watch et al.PDF.....1-10

Submission Description: (doc-less) Motion to Intervene of Riverkeeper, Inc. under CP14-96-000.

Submission Date: 4/8/2014 3:25:45 PM

Filed Date: 4/8/2014 3:25:45 PM

#### Dockets

CP14-96-000 Algonquin Gas Transmission, LLC's Abbreviated Application for a Certificate of Public Convenience and Necessity and for Related Authorizations re its proposed Algonquin Incremental Market (AIM) Project under CP14-96.

#### Filing Party/Contacts:

Filing Party	Signer (Representative)
Other Contact (Principal)	
-----	-----
-----	
Riverkeeper, Inc.	mduvall@riverkeeper.org

#### Basis for Intervening:

Pursuant to Rule 214 of the Federal Energy Regulatory Commission's (FERC or Commission) Rules of Practice and Procedure, 18 CFR § 385.214, Riverkeeper, Inc. (Riverkeeper) hereby moves to intervene in the instant proceeding. In addition, pursuant to Rule 213(a)(2) of the Commission's rules, 18 C.F.R. § 385.213(a)(2), Riverkeeper respectfully requests permission to respond to any answer that may be filed in opposition to its Motion to Intervene.

Riverkeeper is a member-supported, non-profit environmental organization with more than 3,600 members, dedicated to defending the Hudson River and its tributaries and to protecting the drinking water supply of nine million New York City and Hudson Valley residents. Riverkeeper is actively involved in litigation, advocacy, and public education surrounding the issue of shale gas extraction and related infrastructure, particularly because of the potential impacts on New York State's drinking water supplies.

As described below, Riverkeeper meets the requirements for a motion to intervene set forth in 18 CFR § 385.214(b)(1) and (2).

In accordance with our mission, Riverkeeper seeks to ensure that the New York City (NYC) drinking water supply watershed and the Hudson River and its watershed are protected, and that the project complies with the National Environmental Policy Act, 42 U.S.C. §§ 4321 et seq., Federal Water Pollution Control Act (Clean Water Act), 33 U.S.C. §§ 1251 et seq., Safe Drinking Water Act, 42 U.S.C. §§ 300f et seq., and other applicable laws and regulations. See 18 CFR 385.214(b)(1). As detailed in Riverkeeper's comments on the application (Docket No. CP 14-96-000, dated April 8, 2014), which are incorporated by reference in full herein, the Algonquin Incremental Market Project (AIM Project) has the potential to significantly impact not only the Hudson River and its watershed, but also a portion of the NYC drinking water supply watershed. We urge the Commission to take a hard look at all of the likely and reasonably foreseeable environmental impacts that would or could result from the project.

Riverkeeper represents interests that may be directly affected by the outcome of this proceeding. See 18 CFR 385.214(b)(2)(ii). A significant number of

Riverkeeper members depend on the NYC watershed for their drinking water supply, and use and enjoy the Hudson River and its tributaries. Any impacts to the NYC watershed or Hudson River and its watershed could directly affect their interests in clean water and use and enjoyment of the Hudson River and its tributaries. In addition, many Riverkeeper members are also located along the pipeline route and may potentially be affected by construction and maintenance activities.

Riverkeeper's participation is also in the public interest. See 18 CFR 385.214(b)(2)(iii). Riverkeeper's mission is to safeguard the drinking water supply of the nine million New Yorkers who depend on the NYC watershed and to protect the environmental, recreational, and commercial integrity of the Hudson River. As both of these resources may be adversely impacted by the AIM Project, Riverkeeper's participation will help ensure protection of the NYC and Hudson River watersheds and is in the public interest.

Finally, Riverkeeper further qualifies for intervenor status as a party actively participating in the environmental review process. See 18 CFR § 380.10(a). Riverkeeper submitted comments during the scoping process (Docket No. PF 13-16-000, dated October 15, 2013) and on environmental aspects of the application, and plans to continue to fully participate in the environmental review process, including submitting comments on the Draft Environmental Impact Statement.

UNITED STATES OF AMERICA  
FEDERAL ENERGY REGULATORY COMMISSION

Algonquin Gas Transmission, LLC

Docket No. CP14-96-000

NOTICE OF AVAILABILITY OF THE  
DRAFT ENVIRONMENTAL IMPACT STATEMENT FOR THE PROPOSED  
ALGONQUIN INCREMENTAL MARKET PROJECT

(August 6, 2014)

The staff of the Federal Energy Regulatory Commission (FERC or Commission) has prepared a draft environmental impact statement (EIS) for the Algonquin Incremental Market Project (AIM Project), proposed by Algonquin Gas Transmission, LLC (Algonquin) in the above-referenced docket. Algonquin requests authorization to expand its existing pipeline system from an interconnection at Ramapo, New York to deliver up to 342,000 dekatherms per day of natural gas transportation service to the Connecticut, Rhode Island, and Massachusetts markets.

The draft EIS assesses the potential environmental effects of the construction and operation of the AIM Project in accordance with the requirements of the National Environmental Policy Act (NEPA). The FERC staff concludes that approval of the proposed project would result in some adverse environmental impacts; however, most of these impacts would be reduced to less-than-significant levels with the implementation of Algonquin's proposed mitigation and the additional measures recommended in the draft EIS.

The U.S. Environmental Protection Agency, the U.S. Army Corps of Engineers, and the U.S. Department of Transportation's Pipeline and Hazardous Materials Safety Administration participated as cooperating agencies in the preparation of the EIS. Cooperating agencies have jurisdiction by law or special expertise with respect to resources potentially affected by the proposal and participate in the NEPA analysis. Although the cooperating agencies provided input to the conclusions and recommendations presented in the draft EIS, the agencies will present their own conclusions and recommendations in their respective records of decision or determinations for the AIM Project.

The draft EIS addresses the potential environmental effects of the construction and operation of about 37.6 miles of pipeline composed of the following facilities:

- replacement of 26.3 miles of existing pipeline with a 16- and 42-inch-diameter pipeline;

- extension of an existing loop<sup>1</sup> pipeline with about 3.3 miles of additional 12- and 36-inch-diameter pipeline within Algonquin's existing right-of-way; and
- installation of about 8.0 miles of new 16-, 24-, and 42-inch-diameter pipeline.

The AIM Project's proposed aboveground facilities consist of modifications to six existing compressor stations, to add a total 81,620 horsepower, in New York, Connecticut, and Rhode Island. Algonquin also proposes to abandon four existing compressor units for a total of 10,800 horsepower at one compressor station in New York.

The FERC staff mailed copies of the draft EIS to federal, state, and local government representatives and agencies; elected officials; environmental and public interest groups; Native American tribes; potentially affected landowners and other interested individuals and groups; newspapers and libraries in the project area; and parties to this proceeding. Paper copy versions of this EIS were mailed to those specifically requesting them; all others received a CD version. In addition, the draft EIS is available for public viewing on the FERC's website ([www.ferc.gov](http://www.ferc.gov)) using the eLibrary link. A limited number of copies are available for distribution and public inspection at:

Federal Energy Regulatory Commission  
Public Reference Room  
888 First Street NE, Room 2A  
Washington, DC 20426  
(202) 502-8371

Any person wishing to comment on the draft EIS may do so. To ensure consideration of your comments on the proposal in the final EIS, it is important that the Commission receive your comments on or before **September 29, 2014**.

For your convenience, there are four methods you can use to submit your comments to the Commission. In all instances, please reference the project docket number (CP14-96-000) with your submission. The Commission encourages electronic filing of comments and has expert staff available to assist you at (202) 502-8258 or [efiling@ferc.gov](mailto:efiling@ferc.gov). Please carefully follow these instructions so that your comments are properly recorded.

- 1) You can file your comments electronically using the [eComment](#) feature on the Commission's website ([www.ferc.gov](http://www.ferc.gov)) under the link to [Documents and Filings](#). This is an easy method for submitting brief, text-only comments on a project;

---

<sup>1</sup> A pipeline loop is a segment of pipe constructed parallel to an existing pipeline to increase capacity.

- 2) You can file your comments electronically by using the [eFiling](#) feature on the Commission's website ([www.ferc.gov](http://www.ferc.gov)) under the link to [Documents and Filings](#). With eFiling, you can provide comments in a variety of formats by attaching them as a file with your submission. New eFiling users must first create an account by clicking on “[eRegister](#).” If you are filing a comment on a particular project, please select “Comment on a Filing” as the filing type; or
- 3) You can file a paper copy of your comments by mailing them to the following address:

Kimberly D. Bose, Secretary  
 Federal Energy Regulatory Commission  
 888 First Street NE, Room 1A  
 Washington, DC 20426

- 4) In lieu of sending written or electronic comments, the Commission invites you to attend one of the public comment meetings its staff will conduct in the project area to receive comments on the draft EIS. We encourage interested groups and individuals to attend and present oral comments on the draft EIS. Transcripts of the meetings will be available for review in eLibrary under the project docket number. **All meetings will begin at 6:30 p.m. and are scheduled as follows:**

<b>Date</b>	<b>Location</b>
<b>Monday, September 8, 2014</b>	Holiday Inn Dedham 55 Ariadne Road Dedham, MA 02026 (781) 329-1000
<b>Tuesday, September 9, 2014</b>	Holiday Inn Norwich 10 Laura Blvd. Norwich, CT 06360 (860) 889-5201
<b>Wednesday, September 10, 2014</b>	Danbury City Hall City Council Chambers 155 Deer Hill Ave Danbury, CT 06810 (203) 797-4514

Date	Location
<b>Thursday, September 11, 2014</b>	Muriel H. Morabito Community Center 29 Westbrook Drive Cortlandt Manor, NY 10567 (914) 739-5845

Any person seeking to become a party to the proceeding must file a motion to intervene pursuant to Rule 214 of the Commission's Rules of Practice and Procedures (18 Code of Federal Regulations Part 385.214).<sup>2</sup> Only intervenors have the right to seek rehearing of the Commission's decision. The Commission grants affected landowners and others with environmental concerns intervenor status upon showing good cause by stating that they have a clear and direct interest in this proceeding which no other party can adequately represent. **Simply filing environmental comments will not give you intervenor status, but you do not need intervenor status to have your comments considered.**

### Questions

Additional information about the project is available from the Commission's Office of External Affairs, at **(866) 208-FERC**, or on the FERC website ([www.ferc.gov](http://www.ferc.gov)) using the eLibrary link. Click on the eLibrary link, click on "General Search," and enter the docket number excluding the last three digits in the Docket Number field (i.e., CP14-96). Be sure you have selected an appropriate date range. For assistance, please contact FERC Online Support at FercOnline [Support@ferc.gov](mailto:Support@ferc.gov) or toll free at (866) 208-3676; for TTY, contact (202) 502-8659. The eLibrary link also provides access to the texts of formal documents issued by the Commission, such as orders, notices, and rulemakings.

In addition, the Commission offers a free service called eSubscription that allows you to keep track of all formal issuances and submittals in specific dockets. This can reduce the amount of time you spend researching proceedings by automatically providing you with notification of these filings, document summaries, and direct links to the documents. Go to [www.ferc.gov/docs-filing/esubscription.asp](http://www.ferc.gov/docs-filing/esubscription.asp).

Kimberly D. Bose,  
Secretary.

Algonquin Gas Transmission, LLC  
Docket No. CP14-96-000  
FERC/EIS-0254

## TO THE PARTY ADDRESSED:

The staff of the Federal Energy Regulatory Commission (FERC or Commission) has prepared a draft environmental impact statement (EIS) for the Algonquin Incremental Market Project (AIM Project), proposed by Algonquin Gas Transmission, LLC (Algonquin) in the above-referenced docket. Algonquin requests authorization to expand its existing pipeline system from an interconnection at Ramapo, New York to deliver up to 342,000 dekatherms per day of natural gas transportation service to the Connecticut, Rhode Island, and Massachusetts markets.

The draft EIS assesses the potential environmental effects of the construction and operation of the AIM Project in accordance with the requirements of the National Environmental Policy Act (NEPA). The FERC staff concludes that approval of the proposed project would result in some adverse environmental impacts; however, most of these impacts would be reduced to less-than-significant levels with the implementation of Algonquin's proposed mitigation and the additional measures recommended in the draft EIS.

The U.S. Environmental Protection Agency, the U.S. Army Corps of Engineers, and the U.S. Department of Transportation's Pipeline and Hazardous Materials Safety Administration participated as cooperating agencies in the preparation of the EIS. Cooperating agencies have jurisdiction by law or special expertise with respect to resources potentially affected by the proposal and participate in the NEPA analysis. Although the cooperating agencies provided input to the conclusions and recommendations presented in the draft EIS, the agencies will present their own conclusions and recommendations in their respective records of decision or determinations for the AIM Project.

The draft EIS addresses the potential environmental effects of the construction and operation of about 37.6 miles of pipeline composed of the following facilities:

- replacement of 26.3 miles of existing pipeline with a 16- and 42-inch-diameter pipeline;

- extension of an existing loop<sup>1</sup> pipeline with about 3.3 miles of additional 12- and 36-inch-diameter pipeline within Algonquin's existing right-of-way; and
- installation of about 8.0 miles of new 16-, 24-, and 42-inch-diameter pipeline.

The AIM Project's proposed aboveground facilities consist of modifications to six existing compressor stations, to add a total 81,620 horsepower, in New York, Connecticut, and Rhode Island. Algonquin also proposes to abandon four existing compressor units for a total of 10,800 horsepower at one compressor station in New York.

The FERC staff mailed copies of the draft EIS to federal, state, and local government representatives and agencies; elected officials; environmental and public interest groups; Native American tribes; potentially affected landowners and other interested individuals and groups; newspapers and libraries in the project area; and parties to this proceeding. Paper copy versions of this EIS were mailed to those specifically requesting them; all others received a CD version. In addition, the draft EIS is available for public viewing on the FERC's website ([www.ferc.gov](http://www.ferc.gov)) using the eLibrary link. A limited number of copies are available for distribution and public inspection at:

Federal Energy Regulatory Commission  
Public Reference Room  
888 First Street NE, Room 2A  
Washington, DC 20426  
(202) 502-8371

Any person wishing to comment on the draft EIS may do so. To ensure consideration of your comments on the proposal in the final EIS, it is important that the Commission receive your comments on or before **September 29, 2014**.

For your convenience, there are four methods you can use to submit your comments to the Commission. In all instances, please reference the project docket number (CP14-96-000) with your submission. The Commission encourages electronic filing of comments and has expert staff available to assist you at (202) 502-8258 or [efiling@ferc.gov](mailto:efiling@ferc.gov).

---

<sup>1</sup> A pipeline loop is a segment of pipe constructed parallel to an existing pipeline to increase capacity.

- 2) You can file your comments electronically by using the [eFiling](#) feature on the Commission's website ([www.ferc.gov](http://www.ferc.gov)) under the link to [Documents and Filings](#). With eFiling, you can provide comments in a variety of formats by attaching them as a file with your submission. New eFiling users must first create an account by clicking on “[eRegister](#).” If you are filing a comment on a particular project, please select “Comment on a Filing” as the filing type; or
- 3) You can file a paper copy of your comments by mailing them to the following address:

Kimberly D. Bose, Secretary  
 Federal Energy Regulatory Commission  
 888 First Street NE, Room 1A  
 Washington, DC 20426

- 4) In lieu of sending written or electronic comments, the Commission invites you to attend one of the public comment meetings its staff will conduct in the project area to receive comments on the draft EIS. We encourage interested groups and individuals to attend and present oral comments on the draft EIS. Transcripts of the meetings will be available for review in eLibrary under the project docket number. **All meetings will begin at 6:30 p.m. and are scheduled as follows:**

<b>Date</b>	<b>Location</b>
<b>Monday, September 8, 2014</b>	Holiday Inn Dedham 55 Ariadne Road Dedham, MA 02026 (781) 329-1000
<b>Tuesday, September 9, 2014</b>	Holiday Inn Norwich 10 Laura Blvd. Norwich, CT 06360 (860) 889-5201
<b>Wednesday, September 10, 2014</b>	Danbury City Hall City Council Chambers 155 Deer Hill Ave Danbury, CT 06810 (203) 797-4514
<b>Thursday, September 11, 2014</b>	Muriel H. Morabito Community Center 29 Westbrook Drive Cortlandt Manor, NY 10567 (914) 739-5845

Any person seeking to become a party to the proceeding must file a motion to intervene pursuant to Rule 214 of the Commission's Rules of Practice and Procedures (Title 18 Code of Federal Regulations Part 385.214).<sup>2</sup> Only intervenors have the right to seek rehearing of the Commission's decision. The Commission grants affected landowners and others with environmental concerns intervenor status upon showing good cause by stating that they have a clear and direct interest in this proceeding that no other party can adequately represent. **Simply filing environmental comments will not give you intervenor status, but you do not need intervenor status to have your comments considered.**

### **Questions?**

Additional information about the project is available from the Commission's Office of External Affairs, at **(866) 208-FERC**, or on the FERC website ([www.ferc.gov](http://www.ferc.gov)) using the eLibrary link. Click on the eLibrary link, click on "General Search," and enter the docket number excluding the last three digits in the Docket Number field (i.e., CP14-96). Be sure you have selected an appropriate date range. For assistance, please contact FERC Online Support at [FercOnlineSupport@ferc.gov](mailto:FercOnlineSupport@ferc.gov) or toll free at (866) 208-3676; for TTY, contact (202) 502-8659. The eLibrary link also provides access to the texts of formal documents issued by the Commission, such as orders, notices, and rulemakings.

In addition, the Commission offers a free service called eSubscription that allows you to keep track of all formal issuances and submittals in specific dockets. This can reduce the amount of time you spend researching proceedings by automatically providing you with notification of these filings, document summaries, and direct links to the documents. Go to [www.ferc.gov/docs-filing/esubscription.asp](http://www.ferc.gov/docs-filing/esubscription.asp).

Kimberly D. Bose

Secretary

## TABLE OF CONTENTS

### Algonquin Gas Transmission, L.L.C. Algonquin Incremental Market Project (AIM Project) Draft Environmental Impact Statement

	<u>Page</u>
TABLE OF CONTENTS .....	i
LIST OF TABLES .....	viii
LIST OF FIGURES .....	xi
LIST OF APPENDICES .....	xii
ACRONYMS AND ABBREVIATIONS .....	xiii
 <b>EXECUTIVE SUMMARY .....</b>	 <b>1</b>
INTRODUCTION .....	1
PROPOSED ACTION .....	1
PUBLIC INVOLVEMENT .....	2
PROJECT IMPACTS AND MITIGATION .....	2
ALTERNATIVES CONSIDERED .....	9
MAJOR CONCLUSIONS .....	9
 <b>1.0 INTRODUCTION .....</b>	 <b>1-1</b>
1.1 PROJECT PURPOSE AND NEED .....	1-2
1.2 PURPOSE AND SCOPE OF THE EIS .....	1-4
1.2.1 Federal Energy Regulatory Commission Purpose and Role .....	1-4
1.2.2 U.S. Environmental Protection Agency Purpose and Role .....	1-5
1.2.3 U.S. Army Corps of Engineers Purpose and Role .....	1-5
1.2.4 U.S. Department of Transportation – Pipeline and Hazardous Materials Safety Administration .....	1-6
1.3 PERMITS, APPROVALS, AND REGULATORY REQUIREMENTS .....	1-6
1.3.1 Endangered Species Act .....	1-6
1.3.2 Migratory Bird Treaty Act .....	1-10
1.3.3 Magnuson-Stevens Fishery Conservation Management Act .....	1-11
1.3.4 Rivers and Harbors Act .....	1-11
1.3.5 Clean Water Act .....	1-11
1.3.6 Clean Air Act .....	1-12
1.3.7 National Historic Preservation Act .....	1-12
1.3.8 Coastal Zone Management Act .....	1-12
1.4 PUBLIC REVIEW AND COMMENT .....	1-13
1.5 NON-JURISDICTIONAL FACILITIES .....	1-16
 <b>2.0 PROJECT DESCRIPTION .....</b>	 <b>2-1</b>
2.1 PROPOSED FACILITIES .....	2-1
2.1.1 Pipeline Facilities .....	2-1
2.1.1.1 Haverstraw to Stony Point Take-up and Relay .....	2-3
2.1.1.2 Stony Point to Yorktown Take-up and Relay .....	2-4
2.1.1.3 Southeast to MLV 19 Take-up and Relay .....	2-4
2.1.1.4 E-1 System Lateral Take-up and Relay .....	2-4
2.1.1.5 Line-36A Loop Extension .....	2-5

## TABLE OF CONTENTS (cont'd)

	<u>Page</u>
2.1.1.6 E-1 System Lateral Loop Extension .....	2-5
2.1.1.7 West Roxbury Lateral.....	2-5
2.1.2 Aboveground Facilities.....	2-5
2.2 LAND REQUIREMENTS .....	2-8
2.2.1 Pipeline Facilities.....	2-11
2.2.1.1 Replacement .....	2-11
2.2.1.2 Loop Extension.....	2-11
2.2.1.3 New Pipeline .....	2-12
2.2.1.4 Collocation with Existing Rights-of-Way .....	2-12
2.2.1.5 Additional Temporary Workspace .....	2-13
2.2.2 Aboveground Facilities.....	2-14
2.2.3 Pipe and Contractor Ware Yards .....	2-14
2.2.4 Access Roads .....	2-15
2.3 CONSTRUCTION PROCEDURES.....	2-18
2.3.1 Pipeline Facilities.....	2-19
2.3.1.1 General Pipeline Construction Procedures .....	2-20
2.3.1.2 Special Construction Procedures .....	2-25
2.3.2 Aboveground Facility Construction Procedures .....	2-37
2.4 CONSTRUCTION SCHEDULE AND WORK FORCE .....	2-37
2.5 ENVIRONMENTAL TRAINING AND INSPECTION FOR CONSTRUCTION .....	2-37
2.6 OPERATION, MAINTENANCE, AND SAFETY CONTROLS .....	2-41
2.6.1 Pipeline Facilities.....	2-41
2.6.2 Compressor Stations .....	2-42
2.6.3 M&R Station Sites and other Aboveground Facilities.....	2-42
<b>3.0 ALTERNATIVES.....</b>	<b>3-1</b>
3.1 NO-ACTION ALTERNATIVE.....	3-2
3.2 ENERGY ALTERNATIVES .....	3-2
3.2.1 Energy Conservation.....	3-2
3.2.2 Renewable Energy .....	3-4
3.2.2.1 Nuclear Energy.....	3-8
3.2.2.2 Fossil Fuels.....	3-9
3.3 SYSTEM ALTERNATIVES.....	3-9
3.3.1 Status of Existing Systems.....	3-10
3.3.2 Proposed Systems .....	3-10
3.4 FACILITY DESIGN AND SITING ALTERNATIVES .....	3-12
3.4.1 Take-up and Relay .....	3-14
3.4.2 Loop Extension .....	3-15
3.4.3 New Pipeline.....	3-15
3.4.4 Compressor Station Modifications .....	3-15
3.4.5 Conclusions Regarding Facility Design and Siting .....	3-16
3.4.6 Compressor Units .....	3-16
3.4.7 Waste Heat Generation .....	3-18
3.5 ROUTE ALTERNATIVES AND VARIATIONS .....	3-18
3.5.1 Hudson River Northern Route Alternative .....	3-18
3.5.2 West Roxbury Lateral Alternative Route .....	3-22
3.5.3 West Roxbury Lateral South End Alternative Route.....	3-24
3.5.4 Minor Route Variations .....	3-26

## TABLE OF CONTENTS (cont'd)

	<u>Page</u>
3.6 ABOVEGROUND FACILITY SITE ALTERNATIVES .....	3-28
3.6.1 Compressor and M&R Station Modifications .....	3-28
3.6.2 New M&R Stations.....	3-28
3.6.2.1 Oakland Heights M&R Station.....	3-28
3.6.2.2 Assonet M&R Station.....	3-30
3.6.2.3 West Roxbury M&R Station .....	3-30

## EXECUTIVE SUMMARY

---

### INTRODUCTION

The staff of the Federal Energy Regulatory Commission (FERC or Commission) has prepared this draft Environmental Impact Statement (EIS) to fulfill requirements of the National Environmental Policy Act of 1969 and the Commission's implementing regulations under Title 18 of the Code of Federal Regulations (CFR) Part 380. On February 28, 2014, Algonquin Gas Transmission, LLC (Algonquin) filed an application with FERC under sections 7(b) and (c) of the Natural Gas Act, as amended, and Part 157 of the Commission's regulations to construct, abandon, install, own, operate, and maintain expansions of its existing interstate natural gas pipeline systems in New York, Connecticut, Rhode Island, and Massachusetts. This project is referred to as the Algonquin Incremental Market Project (AIM Project or Project). The purpose of this document is to inform the public and federal and state agencies about the potential environmental impacts of the Project and its alternatives, and to recommend appropriate mitigation that would avoid or reduce significant adverse impacts.

The FERC is the federal agency responsible for authorizing interstate natural gas transmission facilities under the Natural Gas Act, and is the lead federal agency for the preparation of this EIS in compliance with the requirements of the National Environmental Policy Act. The U.S. Environmental Protection Agency, the U.S. Army Corps of Engineers (USACE), and the U.S. Department of Transportation's Pipeline and Hazardous Materials Safety Administration, participated as cooperating agencies in the preparation of the EIS. A cooperating agency has jurisdiction by law or has special expertise with respect to environmental resource issues associated with a project.

### PROPOSED ACTION

The Project would involve the construction and operation of about 37.6 miles of natural gas pipeline and associated equipment and facilities in New York, Connecticut, and Massachusetts. The majority of the pipeline facilities (about 26.3 miles or 70 percent of the total 37.6 miles) would replace existing Algonquin pipelines, while the remainder of the pipeline facilities (about 11.3 miles or 30 percent) consists of new mainline pipeline, new loop pipeline, and one new lateral pipeline. In addition to the pipeline facilities, Algonquin would modify 6 existing compressor stations and 24 existing metering and regulating (M&R) stations; construct 3 new M&R stations; and remove an existing M&R station. Modifications to the six existing compressor stations include the installation of 81,620 total horsepower (hp) in New York, Connecticut, and Rhode Island. Algonquin also proposes to abandon four existing compressor units for a total of 10,800 hp at one compressor station in New York. Algonquin would also modify three existing mainline valve (MLV) sites and five existing pig<sup>1</sup> launcher/receiver sites, construct five new launcher/receiver sites, construct new MLV cross over piping at two locations, and construct a new MLV. Mainline regulation facilities would also be added at the terminus of one of the pipeline segments in New York.

According to Algonquin, the purpose of the AIM Project is to expand its existing pipeline system from an interconnection at Ramapo, New York to deliver up to 342,000 dekatherms per day of natural gas transportation service to the Connecticut, Rhode Island, and Massachusetts markets. Algonquin's stated objectives for the Project are:

- to provide the pipeline capacity necessary to transport additional natural gas supplies to meet the immediate and future load growth demands of local gas utilities in southern New England;

---

<sup>1</sup> A pipeline "pig" is a device to clean or inspect the pipeline. A pig launcher/receiver is an aboveground facility where pigs are inserted or retrieved from the pipeline.

- eliminate capacity constraints on existing pipeline systems in New York State and southern New England;
- provide access to growing natural gas supply areas in the Northeast region to increase competition and reduce volatility in natural gas pricing in southern New England; and
- improve existing compressor station emissions through the replacement of existing compressor units with new, efficient units.

## PUBLIC INVOLVEMENT

On June 18, 2013, Algonquin filed a request with the FERC to implement the Commission's pre-filing process for its Project. At that time, Algonquin was in the preliminary design stage of its Project and no formal application had been filed. The purpose of the pre-filing process is to encourage the early involvement of interested stakeholders, facilitate interagency cooperation, and identify and resolve issues before an application is filed with the FERC. On June 28, 2013, the FERC granted Algonquin's request and established a pre-filing docket number (PF13-16-000) to place information related to the Project into the public record. The cooperating agencies agreed to conduct their environmental reviews of the Project in conjunction with the Commission's environmental process.

On September 13, 2013, the FERC issued a *Notice of Intent to Prepare an Environmental Impact Statement for the Planned Algonquin Incremental Market Project, Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings* (NOI). The NOI was published in the Federal Register on September 19, 2013, and copies were mailed to over 1,800 parties, including representatives of federal, state, and local agencies; elected officials; environmental and public interest groups; Native American tribes; potentially affected landowners; other interested parties; and local libraries and newspapers. The FERC staff continued to receive and consider comments during the entire pre-filing period and throughout the development of this EIS. We<sup>2</sup> held four public scoping meetings in the AIM Project area to solicit and receive comments on environmental issues associated with this Project. The meetings were held September 30, 2013 through October 3, 2013 in the Town of Cortlandt, New York; Danbury and Norwich, Connecticut; and the Town of Dedham, Massachusetts.

Additionally, we participated in Algonquin's open houses, interagency meetings, conference calls, and site visits for the AIM Project to identify issues to be addressed in this draft EIS. The meetings, conference calls, and site visits provided a forum for the exchange of information and supported the FERC's responsibility to coordinate federal authorizations and associated environmental review of the AIM Project.

## PROJECT IMPACTS AND MITIGATION

Construction and operation of the Project could result in numerous impacts on the environment. We evaluated the impacts of the Project, taking into consideration Algonquin's proposed mitigation measures on geology, soils, groundwater, surface water, wetlands, vegetation, wildlife, fisheries, special status species, land use, recreation, visual resources, socioeconomic, cultural resources, air quality, noise, and safety and reliability. Where necessary, we are recommending additional mitigation to minimize or avoid these impacts. Also, in some cases, we are recommending that Algonquin file certain information prior to the end of the public comment period to allow us to revise or potentially eliminate recommendations in the final EIS. Cumulative impacts of this Project with other past, present, and reasonably foreseeable actions in the Project area were also assessed. In section 3 of this EIS, we

---

<sup>2</sup> The pronouns "we," "us," and "our" refer to the environmental staff of the FERC's Office of Energy Projects.

summarize the evaluation of alternatives to the Project, including the No Action Alternative, energy alternatives, system alternatives, facility design and siting alternatives, route alternatives and variations, and aboveground facility siting alternatives.

Based on scoping comments, agency consultations, and our independent evaluation of resource impacts, the major issues identified in our analysis are in regard to blasting impacts, waterbody crossings, wetlands, special status species, land use and recreation, traffic impacts, safety, and alternatives. Our analysis of these issues is summarized below and is discussed in detail in the appropriate resource sections in sections 3 and 4 of this EIS. Sections 5.1 and 5.2 of this EIS contain our conclusions and a compilation of our recommended mitigation measures, respectively.

The potential for geologic hazards, including seismic events, to significantly affect construction or operation of the proposed Project facilities is low. Although the Ramapo Fault has been linked to recent earthquake occurrence in the area, the design of the pipeline takes into consideration site-specific conditions, including earthquakes. The recorded magnitude of earthquakes in the Project area is relatively low and the ground vibration would not pose a problem for a modern welded-steel pipeline.

The pipeline segments would traverse about 7.2 miles of shallow bedrock that may require blasting. In order to minimize potential impacts from blasting, Algonquin would comply with all federal, state, and local regulations for blasting and has developed an acceptable Rock Removal Plan to be used during construction.

Existing soil contamination could be encountered during construction. Algonquin has developed an *Unexpected Contamination Encounter Procedures* to address the measures it would implement if contaminated soils are crossed during construction. To-date, Algonquin has also determined that field sampling would be required at two locations (one in Connecticut and one in Massachusetts). However, the Connecticut Department of Energy and Environmental Protection (CTDEEP) also identified a concern at a third site. We are recommending that prior to construction, Algonquin develop a Field Sampling Plan for these and any other potential contaminated sites that could be encountered during construction.

The Project would cross 108 waterbodies, including 42 perennial streams, 62 intermittent streams, 3 ephemeral streams, and a ponded area. Algonquin proposes to use a dry crossing method (i.e., flume or dam-and-pump) to install all but two of the waterbody crossings. The other two waterbodies would be crossed using the horizontal directional drill (HDD) method (Hudson and Still Rivers). Dry crossing methods typically result in lower sedimentation and associated turbidity impacts when compared to conventional wet crossing methods.

The Project would cross the Hudson River in New York and the Still River in Connecticut using the HDD method. Algonquin performed geotechnical feasibility studies at the proposed HDD sites and developed site-specific crossing plans for both of the crossings. Algonquin has also developed a *Best Drilling Practices, Monitoring, and Clean-up of Horizontal Directional Drilling Inadvertent Returns Plan* (BDP Plan) that describes the measures that would be taken to minimize the potential for inadvertent returns and releases at these two locations. Algonquin's implementation of the HDD method at the Hudson and Still Rivers would avoid in-stream disturbance of these waterbodies.

Several comments were received about the Project's potential to impact the watersheds that supply water to the New York City metropolitan area, including the Croton, the Catskill, and the Delaware Water Supply Systems. As with the existing pipelines in the area, the replacement pipeline would be located above the Catskill Aqueduct on concrete pads to provide adequate separation and protection for the aqueduct pipe. Algonquin is consulting with the New York City Department of Environmental Protection to develop a final crossing plan for the Catskill Aqueduct. Construction

activities would be conducted in accordance with Algonquin's *Erosion and Sediment Control Plan* (E&SCP), Spill Prevention Control and Countermeasure Plan, Unexpected Contamination Encounters Procedures, Rock Removal Plan, BDP Plan, and construction stormwater plans and permits. With these protection measures in place, construction and operation of the Project would not result in significant impacts on surface water resources, including the Croton, Catskill, and Delaware water supply systems.

Construction of the Project would impact 52.3 acres of wetlands, about 24.0 acres in New York and 28.3 in Connecticut. Of the total wetland acreage, about 35.3 acres (67 percent) would involve herbaceous and shrub-scrub wetlands, and the remaining 17.1 acres (33 percent) would involve forested wetlands. About 2.3 acres of the forested wetlands would be permanently converted to non-forested wetlands during operation of the pipeline facilities. The remaining 14.7 acres of forested wetlands would eventually revert to preconstruction conditions following construction. The Project would not result in any permanent loss of wetlands. In addition, two vernal pools would be located within the temporary construction area for the Project facilities in New York.

Construction and operation-related impacts on wetlands and vernal pools would be mitigated by implementing the wetland protection and restoration measures contained in Algonquin's E&SCP, Invasive Plant Species Control Plan, and any additional conditions of the wetland permits that could be issued by the USACE, New York State Department of Environmental Conservation (NYSDEC), and CTDEEP. Algonquin proposes to provide compensatory mitigation for the permanent conversion of forested wetlands to a non-forested wetland type. We are recommending that Algonquin develop a final Compensatory Mitigation Plan in consultation with the USACE, the NYSDEC, and the CTDEEP. We are also recommending that Algonquin identify any additional avoidance or mitigation measures for the two vernal pools through the permit review process with the applicable agencies, prior to construction.

Impacts on vegetation from the proposed Project would range from short-term to permanent due to the varied amount of time required to reestablish certain community types, as well as the maintenance of grassy vegetation within the permanent right-of-way and the conversion of aboveground facility locations to non-vegetated areas. Construction of the proposed Project facilities would temporarily disturb about 362.9 acres of vegetation (164.0 acres of open land and 198.9 acres of forested vegetation) and permanently affect 36.3 acres (8.3 acres of open land and 28.0 acres of forested vegetation). The Project would also affect vegetation communities of special concern, including chestnut oak forests. Algonquin would limit the amount of disturbance to chestnut oak forests by utilizing the existing pipeline right-of-way during construction to the extent possible. Overall, the Project would not contribute significantly to forest fragmentation because the proposed pipeline routes are located along existing rights-of-way and in areas that are already developed and highly fragmented.

The Project would affect wildlife and wildlife habitats, including migratory birds, along the pipeline route and at the aboveground facilities. Algonquin has minimized potential effects on significant or sensitive wildlife habitats by locating the majority of pipeline facilities within or adjacent to existing rights-of-way to the maximum extent possible. Algonquin would also use the HDD crossing method at the Hudson River crossing to avoid direct effects to the Hudson River Important Bird Area, aquatic habitats, and adjacent riparian habitats. Algonquin would implement its E&SCP and any permit conditions developed through consultation with the applicable federal and state agencies to minimize the effects of the Project on wildlife and their habitats. We find that these measures would minimize the effects of the Project on wildlife, including birds of conservation concern and other migratory birds. We are recommending that Algonquin obtain a FWS determination regarding migratory birds prior to construction.

Thirty-one of the Project waterbody crossings support fisheries of special concern. Eight waterbodies are waters with naturally occurring spawning populations of trout. One waterbody (the

Hudson River) contains threatened and endangered species and anadromous fisheries. Implementation of Algonquin's construction, restoration, and mitigation procedures would result in only limited, short-term impacts on fishery resources, and the aquatic habitats upon which these fishery resources depend. Invertebrate populations would recolonize the crossing area and all temporary construction workspace areas would revert to their original condition, including re-establishment of riparian cover. Furthermore, operation and routine maintenance of the pipeline rights-of-way are not expected to have any noticeable impact on fishery resources in the Project area.

Through consultation with National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NOAA Fisheries), we have determined that the only waterbody crossing where essential fish habitat species could potentially occur is the Hudson River. Given the proposed use of the HDD construction method and the fact that no water would be withdrawn from the Hudson River to support Project construction, we conclude that the Project would have *no effect* on essential fish habitat or managed species. We have also determined that the Project would have no effect on marine mammals protected under the Marine Mammal Protection Act because they are not anticipated to occur within the Project area of the Hudson River.

Based on Algonquin's consultations with NOAA Fisheries and the U.S. Fish and Wildlife Service (FWS) and our review of existing records, nine federally listed threatened or endangered species are potentially present in the vicinity of the Project (as well as one candidate species and one species proposed for listing as endangered). Based on these consultations, we determined that the AIM Project would have *no effect* on the shortnose sturgeon, Atlantic sturgeon, piping plover, roseate tern, Puritan tiger beetle, northern red-bellied cooter, and small whorled pogonia; *may affect, but would not likely adversely affect* the bog turtle; and *would not likely jeopardize the continued existence* of the New England cottontail. Surveys are pending for the Indiana and northern long-eared bats. NOAA Fisheries concurred with this determination for the Atlantic and shortnose sturgeon and consultation is complete for these species. In compliance with section 7 of the Endangered Species Act, we request the FWS consider the draft EIS as the draft Biological Assessment for the AIM Project and request FWS concurrence for the species with *no effect* determinations. The final EIS will include a revised Biological Assessment to address the remaining species. To ensure compliance with the ESA, we are recommending that Algonquin not begin construction of the Project until the FERC staff receives comments from the FWS regarding the Biological Assessment and consultation is complete. Algonquin is also continuing to consult with the NYSDEC and CTDEEP regarding impacts on state-listed species. No state-listed species would be affected in Rhode Island or Massachusetts.

Algonquin conducted bald eagle surveys for the Hudson River crossing area and identified wintering eagles. No bald eagle nests were observed in the Project area or within 0.5 mile of the Project. Algonquin would continue to consult with the FWS and NYSDEC to discuss survey results, and develop and implement appropriate avoidance and mitigation measures, including timing restrictions, as necessary, to avoid impacts on bald eagles both nesting and wintering within the Project area.

Construction of the Project would impact about 592.3 acres. About 76 percent of this acreage would be utilized for the pipeline facilities, including the construction right-of-way (64 percent) and additional temporary workspace (12 percent). The remaining acreage impacted during construction would be associated with aboveground facilities (16 percent), pipe and contractor ware yards (7 percent), and access roads (less than 1 percent). The primary land use types impacted during construction would be forest/woodland (34 percent), open land (28 percent), industrial/commercial land (26 percent), and residential land (9 percent). Agricultural land and open water would make up the remaining 3 percent of land types impacted during construction of the proposed Project.

Following construction, about 46.0 acres of new land outside of Algonquin's existing permanent right-of-way would be permanently encumbered by operation of the Project. About 82 percent of this acreage would be for the new pipeline right-of-way, 14 percent for aboveground facilities, and 4 percent for new permanent access roads. The primary land use types that would be permanently encumbered by new easements would be forest/woodland (61 percent), open land (18 percent), industrial/commercial land (11 percent), and agricultural land (6 percent). Open water and residential land would make up the remaining 4 percent of new permanent impacts.

Algonquin's proposed construction work areas would be located within 50 feet of 337 residential structures (i.e., houses and apartment buildings) and 95 non-residential structures (i.e., commercial or industrial facilities, sheds, garages). To address impacts on residences, Algonquin developed Residential Construction Plans to inform affected landowners of proposed measures to minimize disruption and to maintain access to the residences during construction. We have reviewed the Residential Construction Plans and do not find them acceptable. We are recommending that Algonquin provide a revised set of Residential Construction Plans that incorporate and address any comments received from affected landowners and also incorporate additional measures to minimize effects prior to construction.

In general, Project impacts on recreational and special interest areas would be temporary and limited to the period of active construction, which typically lasts several weeks or months in any one area. These impacts would be minimized by implementing the measures in Algonquin's E&SCP, traffic management plans, our recommended Fugitive Dust Control Plan, as well as measures to ensure that noise is mitigated. In addition, we are recommending that Algonquin develop site-specific measures to further minimize impacts on St. Patrick's Church in Verplanck, New York; the Buchanan-Verplanck Elementary School in New York; Dodd Stadium in Norwich, Connecticut; the Norfolk Golf Club in Westwood, Massachusetts; Gonzalez Field in Dedham, Massachusetts; and St. Theresa of Avila School in West Roxbury, Massachusetts.

To address traffic impacts related to road crossings and in-street construction in densely populated areas, Algonquin has prepared separate Traffic Management Plans for the West Roxbury Lateral in Massachusetts and pipeline segments in New York. The plans include measures to address motor vehicles, parking, and considerations for pedestrians, bicycles, and construction workers. We have reviewed these plans and found them acceptable with the exception of a portion of the Traffic Management Plan for the New York pipeline segments. Therefore, we are recommending that Algonquin provide a revised plan that includes the site-specific details for several road crossings prior to construction. Impacts on traffic during construction along the West Roxbury Lateral would result in significant adverse impacts at one intersection. However, with the implementation of Algonquin's Traffic Management Plan for the West Roxbury Lateral, impacts resulting from in-street construction would be minimized to the extent possible and would be reduced to less than significant levels at all other locations along the West Roxbury Lateral.

Construction of the Project would result in minor beneficial socioeconomic impacts due to increases in construction jobs, payroll taxes, purchases made by the workforce, and expenses associated with the acquisition of material goods and equipment. Operation of the Project would have a minor to moderate positive effect on the local governments' tax revenues due to the increase in property taxes that would be collected from Algonquin.

Algonquin conducted archival research and walkover surveys of the proposed Project area to identify historic aboveground properties and locations for additional subsurface testing in areas with potential for prehistoric and historic archaeological sites. Algonquin then conducted field surveys for aboveground properties and archaeological sites. Algonquin identified a total of 42 archaeological sites within the Project's area of potential effect. Of these, 27 require additional testing to determine eligibility

for listing on the National Register of Historic Places (NRHP); 13 are not eligible; 1 is eligible for listing but would be avoided by the Project; and 1 is listed on the NRHP but would also be avoided by the Project. In addition, 387 historic aboveground resources were identified within the area of potential effect, the majority of which (358) are not eligible for listing on the NRHP and no further work is recommended. Of the remaining resources, effects to one (Letchworth Village Cemetery) have yet to be determined and are pending additional evaluation. The Project would not result in any significant or adverse effects on the remaining identified historic aboveground resources. To ensure that our responsibilities under section 106 of the National Historic Preservation Act are met, we are recommending that Algonquin not begin construction until any additional required surveys are completed, remaining survey reports and treatment plans (if necessary) have been reviewed by the appropriate parties, and we provide written notifications to proceed.

We consulted with nine federally recognized Indian tribes to provide an opportunity to identify any concerns about properties of traditional religious or cultural significance that may be affected by this undertaking. Eight of the tribes have contacted FERC staff to express an interest in the Project, request additional information, request to be kept apprised of the Project, and/or to accompany the archaeological field crews. Consultations with several other governmental organizations, non-governmental organizations, non-federally recognized tribes, and municipal historic preservation commissions in New York and Massachusetts were also conducted to provide them an opportunity to comment on the Project.

Air quality impacts associated with construction of the Project would include emissions from fossil-fueled construction equipment and fugitive dust. Such air quality impacts would generally be temporary and localized, and are not expected to cause or contribute to a violation of applicable air quality standards. Because the Project would cross many roads, would occur near many residences, and is located in a particulate matter maintenance area, we have recommended that Algonquin develop a Fugitive Dust Control Plan to further mitigate dust.

Due to modifications on existing equipment and/or removal of existing compressors, the potential emissions of most pollutants at the Stony Point and Southeast Compressor Stations would be reduced from their current potential levels. Further, based on the identified estimated emissions from operation of the proposed Project facilities and review of the modeling analysis for all compressor stations, the Project would result in continued compliance with the National Ambient Air Quality Standards, which are protective of human health, including children, the elderly, and sensitive populations. Therefore, with the mitigation measures proposed by Algonquin, we do not anticipate that construction and operation of the proposed Project facilities would have a significant impact on air quality in the Project area or in the region itself. Because the design of the modifications to several M&R stations is not yet complete, we are recommending that Algonquin provide an update regarding the air permitting requirements associated with the modifications to the M&R stations in New York, Connecticut, and Massachusetts.

Noise would be generated during construction of the pipeline and aboveground facilities. Noise impacts during construction would be highly localized and attenuate quickly as the distance from the noise source increases. The one exception to this would be certain HDD activities at the Hudson River and Interstate 84/Still River crossings. Algonquin would implement mitigation at all proposed HDD entrance locations to reduce the predicted noise generated by the HDD operations below the FERC noise requirement of 55 decibels on an A-weighted scale – day/night average at the closest noise sensitive areas.

The modified compressor stations would generate noise on a continuous basis (i.e., 24 hours per day) once operating. Some noise would also be generated by the operation of M&R stations and the proposed mainline regulators. We reviewed the compressor station noise analyses and agree that, if properly implemented, the noise control measures would ensure that noise attributable to the modified

compressor stations would be less than the FERC noise requirement at nearby noise sensitive areas. However, where the noise currently attributable to the compressor station is greater than our noise requirement, the noise attributable to the station modifications would cause no perceptible change to station noise levels. To ensure that the actual noise levels produced at the aboveground facilities are not significant, we are recommending that Algonquin submit operational noise surveys and add noise mitigation, as necessary, until noise levels are below our acceptable thresholds.

The pipeline and aboveground facilities associated with the AIM Project would be designed, constructed, operated, and maintained to meet or exceed the Pipeline and Hazardous Materials Safety Administration's Minimum Federal Safety Standards in 49 CFR 192 and other applicable federal and state regulations. The regulations include specifications for material selection and qualifications; minimum design requirements; and protection of the pipeline from internal, external, and atmospheric corrosion. By designing and operating the Project in accordance with the applicable standards, the Project would not result in significant increased public safety risk.

We received several scoping comments concerning the safety of the Project and its proximity to the Indian Point Energy Center (IPEC), a nuclear facility on the east bank of the Hudson River in Westchester County, New York. Algonquin identified that because of the distance of the proposed Project from the IPEC generating facilities and the avoidance and mitigation measures that it would implement, the proposed route would not pose any new safety hazards to the IPEC facility. Based on our consultation with the Nuclear Regulatory Commission, Entergy Nuclear Operations, Inc. (Entergy) is required to assess any new safety impacts on its IPEC facility and that analysis is provided to and reviewed by the Nuclear Regulatory Commission. Algonquin has coordinated with Entergy to provide information about its proposed pipeline and Entergy is currently performing a Hazards Analysis. To ensure that the AIM Project would not present new safety hazards to the IPEC facility, we are recommending that Algonquin file the final conclusions regarding any potential safety-related conflicts with the IPEC based on the Hazards Analysis performed by Entergy.

We also received several comments expressing safety concerns about potential interactions between Algonquin's proposed pipeline facilities and the West Point Partners' transmission line. Algonquin has committed to conduct an alternating current/direct current (AC/DC) interference study and incorporate field surveys and comprehensive modeling to identify potential adverse effects on the pipeline from stray currents. Although pipelines are routinely sited adjacent to electric transmission lines, we are recommending additional information to ensure that safety concerns about potential AC/DC interactions are adequately addressed. This includes receiving Algonquin's AC/DC interference study associated with the West Point Transmission Project and documentation of all consultations with West Point Partners, as well as any additional mitigation measures addressing safety-related issues or conflicts identified in the study.

We received numerous comments during scoping for the Project about cumulative impacts associated with development of natural gas reserves (including hydraulic fracturing) in the Marcellus shale region. Activities associated with Marcellus shale development would occur outside of the Project area's region of influence. As a result, the local resources that may be affected by Marcellus shale development would not be affected by the Project, and local resources affected by the Project would not be affected by development in the Marcellus shale region. Impacts associated with the proposed Project in combination with other projects identified within the region of influence would be relatively minor overall. We have included recommendations in the EIS to further reduce the environmental impacts associated with the AIM Project, as summarized in section 5.2. Additionally, Algonquin selected a route that collocates with existing rights-of-way where feasible. Therefore, we conclude that the cumulative impacts associated with the AIM Project, when combined with other known or reasonably foreseeable projects, would be effectively limited.

## **ALTERNATIVES CONSIDERED**

The No Action Alternative was considered for the Project. While the No Action Alternative would eliminate or delay the short and long-term environmental impacts identified in this EIS, Algonquin would be unable to supply an additional 342,000 dekatherms per day of natural gas to its existing mainline system; increase deliveries to the Project shippers at existing delivery points in southern New England; or provide three new delivery points for the Project shippers. We also considered the use of alternative energy sources and the potential effects of energy conservation, but these measures similarly would not satisfy the objectives of the Project, provide an equivalent supply of energy, or meet the demands of the Project shippers. We concluded that the No Action Alternative, alternative energy sources, and energy conservation were not viable alternatives to the proposed Project in the required timeframe.

Our analysis of system alternatives included an evaluation of the existing Tennessee Gas Pipeline and Iroquois Gas Transmission systems as well as the planned Connecticut Expansion and Northeast Energy Direct Projects. None of the existing, proposed, or planned natural gas pipelines reach the delivery points required by the Project shippers in southern New England. To provide service to these delivery points, the existing and planned systems would need to be modified by constructing hundreds of miles of new pipeline, much of which would duplicate the existing Algonquin system. This would result in greater environmental impacts than the Project. Consequently, none of the system alternatives provide an environmental advantage over the proposed Project.

We evaluated Algonquin's proposed design for the Project to determine if any alternative designs would be feasible and environmentally preferable to the Project. We determined that alternative designs would result in operational inefficiencies associated with flow characteristics of natural gas within the system, and would shift, but not avoid, environmental impacts from one location to another. For these reasons, we concluded that alternative designs would not be practical or provide an environmental advantage over the proposed Project.

We also considered the feasibility of electric-driven compressor units in lieu of gas-fired units at each of the existing compressor station sites. We concluded that use of electric-driven compressor units would result in additional environmental impacts due to the installation of non-jurisdictional facilities such as electric transmission lines and substations. Although electric-driven units would result in lower operating emissions, Algonquin would be required to comply with its existing air permits at each site. For these reasons, electric-driven compressors would not be preferable to or provide a significant environmental advantage over the proposed Project.

We evaluated route alternatives for the Hudson River crossing and for the West Roxbury Lateral; several minor route variations along different segments of the Project; and site alternatives for M&R stations at the new delivery points in Connecticut and Massachusetts. We determined that none of the route or site alternatives would offer significant environmental advantages over the Project.

## **MAJOR CONCLUSIONS**

We determined that construction and operation of the Project would result in some adverse environmental impacts but most impacts would be reduced to less-than-significant levels. This determination is based on a review of the information provided by Algonquin and further developed from environmental information requests; site visits; scoping; literature research; alternatives analyses; and contacts with federal, state, and local agencies, and other stakeholders.

Although many factors were considered in this determination, the principal reasons are:

- About 35.1 miles (93 percent) of the 37.6 miles of AIM Project pipeline facilities would be within or adjacent to existing rights-of-way, consisting of Algonquin pipeline rights-of-way, public roadways, railways, and electric transmission line corridors.
- The majority of the pipeline facilities (70 percent) would replace existing Algonquin pipelines within existing rights-of-way.
- Algonquin would minimize impacts on natural and cultural resources during construction and operation of the Project by implementing its E&SCP; Spill Prevention, Control and Countermeasure Plan; Unexpected Contamination Encounter Procedures; Invasive Plant Species Control Plan; BDP Plan; Compensatory Mitigation Plan; Residential Construction Plans; Traffic Management Plans for New York and the West Roxbury Lateral; and *Procedures Guiding the Discovery of Unanticipated Cultural Resources and Human Remains*.
- Algonquin would utilize the HDD method to cross the Hudson and Still Rivers, which would avoid any direct impacts on these resources.
- We would complete Endangered Species Act consultations with the FWS prior to allowing any construction to begin.
- We would complete the process with section 106 of the National Historic Preservation Act and implementing the regulations at 36 CFR 800 prior to allowing any construction to begin.
- We would ensure compliance with all mitigation measures that become conditions of the FERC authorizations and other approvals during our oversight of an environmental inspection and mitigation monitoring program

In addition, we developed site-specific mitigation measures that Algonquin would implement to further reduce the environmental impacts that would otherwise result from construction of its Project. We determined that these measures are necessary to reduce adverse impacts associated with the Project, and in part, are basing our conclusions on implementation of these measures. Therefore, we are recommending that these mitigation measures be attached as conditions to any authorization issued by the Commission. These recommended mitigation measures are presented in section 5.2 of the draft EIS.

**MICHELLE WU**  
**BOSTON CITY COUNCIL**

**Docket #CP14-96-000**

September 16, 2014

Members of FERC,

I write to you regarding my concerns and the concerns of my constituents about the Algonquin Pipeline expansion (AIM) project, specifically the five mile spur that travels through the town of Dedham and into the Boston neighborhood of West Roxbury. Over the last nine months, I've learned of this proposal in bits and pieces from my constituents, from Spectra's community meeting on September 3, 2014, and from FERC's public comment session on September 8, 2014. My concerns fall into four general categories: safety, construction impacts, the necessity of the five mile spur, and the lack of public awareness of this project.

**Safety:** The proposed route of a West Roxbury Lateral down Centre Street would run extremely close to the active quarry owned by West Roxbury Crushed Stone at 10 Grove Street and the proposed metering station across the street from the quarry. While proponents have stated to the abutters of the pipeline that these factors do not create increased chances of leaks or explosions, I believe that this proposed route and metering station creates an unnecessary risk that could easily be mitigated by altering the route. As it stands, the residents of Dedham and West Roxbury carry the brunt of the risks associated with the entire Algonquin Pipeline proposal, as 64% of all residential areas and 54% of all commercial areas that the pipeline passes through lie in West Roxbury and Dedham. These are overwhelming numbers, and I share deeply in my constituents' concerns for safety and disproportionate risk..

**Construction Impacts:** If the proposed West Roxbury Lateral is approved, the construction impacts will be felt by residents across West Roxbury, hitting direct abutters hardest. Grove and Centre Streets are two lane roads that are heavily frequented by motor vehicle traffic. Any lane closures, no matter the length of time, disrupt the quality of life of neighborhood residents. Therefore, construction and the subsequent lane closures should be undertaken only when they are completely necessary, and no information I have in regard to this project has indicated such a requirement.

**Necessity of the spur:** As mentioned, I have concerns regarding the necessity of the proposed five mile spur known as the West Roxbury Lateral. When one looks at Spectra's overall proposal, it becomes apparent that the West Roxbury Lateral represents a small fraction of the pipeline and is not an essential or necessary piece of it overall. We have been told that the Lateral is a response to a request from National Grid for increased capacity, citing demand from customers. I contend that the concerns of the direct abutters of this proposal, as well as those of the West Roxbury neighborhood at large should be weighed equally if not more heavily than the gas company that will distribute this product throughout the immediate region.

BOSTON CITY HALL, ONE CITY HALL SQUARE, BOSTON, MASSACHUSETTS, 02201  
617-635-3115 • FAX: 617-635-4203 • MICHELLE.WU@BOSTON.GOV

**MICHELLE WU**  
**BOSTON CITY COUNCIL**

Lack of public awareness: Finally I ask that FERC extend the comment period past September 29, 2014, so the residents of West Roxbury who wish to learn more about the proposed West Roxbury Lateral and give feedback have ample time to do so. Prolonging the comment period would increase community input and allay some of the continued concerns my constituents and I share around lack of public awareness regarding this process and project.

I appreciate the opportunity to voice my concerns around Spectra's proposed West Roxbury Lateral and look forward to a productive and inclusive process regarding the future of this proposal. Until or unless such a process occurs, I cannot support this pipeline project based on the current information available.

Sincerely,

Michelle Wu  
Boston City Councilor At-Large

UNITED STATES OF AMERICA  
BEFORE THE  
FEDERAL ENERGY REGULATORY COMMISSION

---

Algonquin Gas Transmission, LLC  
Algonquin Incremental Market Project

Docket No. CP14-96-000  
PF13-16-000

---

**MOTION TO INTERVENE OF REYNOLDS HILLS, INC.**

On August 6, 2014, the Federal Energy Regulatory Commission ("FERC") issued a Draft Environmental Impact Statement (the "Draft EIS") for the proposed Algonquin Incremental Market Project (the "Project"), FERC Docket No. CP14-96-000. Algonquin Gas Transmission LLC ("Algonquin"), a wholly owned subsidiary of Spectra Energy Partners, LP ("Spectra"), seeks, among other things, authorization to construct up to 42-inch diameter pipelines and all appurtenant facilities as well as stations in New York, Connecticut, Rhode Island and Massachusetts.

Pursuant to 18 C.F.R. § 157.10 and 18 C.F.R. § 385.214, Reynolds Hills, Inc. ("Reynolds Hills"), by and through their President, Nancy S. Vann, respectfully moves for the Commission to grant intervention in the above-captioned matter. The proposal will modify, expand, and construct a large gas pipeline that already runs along and through Reynolds Hills. The proposal would negatively impact our environment by impacting a wetland on our property, exposing us to airborne contaminants in a non-attainment area under the Clean Air Act, and would forever alter our community because our property abuts and is transected by the significant changes proposed for the pipeline route. The proposal would cause environmental damage to our property and would negate the reason for our community's existence – an environmental aesthetic and place to commune with nature and friends in a small community in northern Westchester County.

We timely file this motion to intervene and to oppose the pipeline's proposed modifications and route within the public comment period for the *Draft EIS*. The comment period ends on September 29, 2014, and thus, the Commission must deem the intervention to be filed timely, in accordance with both 18 C.F.R. § 157.10 (a)(2) and 18 C.F.R. § 385.214. Reynolds Hills intends to timely file substantive comments on the Draft EIS for the above referenced application.

## **I. COMMUNICATION AND CORRESPONDENCE**

Service in this proceeding should be made upon, and communications should be directed to the following persons:

Nancy S. Vann,  
President, Reynolds Hills, Inc.  
201 Union Avenue  
Peekskill, New York 10566  
nancy\_vann@hotmail.com

## **II. INTERVENOR**

Reynolds Hills is a non-profit summer bungalow community located in the City of Peekskill and in the Town of Cortlandt, both in Westchester County, New York. As property owners, we are concerned about the environmental impact of this proposed 42-inch-diameter high-pressure natural gas pipeline project. The pipeline currently runs adjacent to and through our property, which will be significantly negatively impacted by the proposed construction, maintenances, and expansion of the pipeline.

Our historic bungalow community was established in 1929 and pre-dates the existing and proposed pipeline by over two decades. There are seventy-two (72) individual cottages, a community social hall, a swimming pool, a tennis court, a stream and an area of separate community gardens. Much of the Reynolds Hills property is undisturbed woodlands and mature wetlands. Most, but not all of the cottages in our community are three-season homes; some occupied only on weekends, but many occupied full time between April 1st and November 15th. Several are year-round residences. Members of the community include descendants of the original founders, young families, hikers, kayakers, gardeners and senior citizens seeking an undisturbed place to enjoy nature. Our community rules have been established to protect the currently existing natural and historic nature of our property - and under these rules, no further development is permitted.

## **III. GROUNDS FOR INTERVENTION**

Reynolds Hills is extremely concerned about the negative environmental impacts identified in the *Draft EIS* for Algonquin's application and about the significant environmental impacts that were not addressed by the *Draft EIS*. Our community and its members will be directly impacted by the Project that will run across our property.

## Safety

The roads within Reynolds Hills are single lane roads and the ravine and wetlands are not readily accessible from our entry road, which would make it nearly impossible to deploy any firefighting effort there. Since a fire along the pipeline near our homes, whether during or after construction, would not be accessible to firefighting equipment due to its unique and somewhat hidden location, it would be disastrous for any of our members that were in the community at the time of such an incident. In addition, any fire would be a major threat to the seventy-two (72) houses and the other structures in our community, the woodlands habitat that is around and between them, and the natural wetland and brook area.

There have been a number of pipeline disasters in the current decade alone. A 2010 natural gas line explosion in San Bruno, California killed eight people and damaged or destroyed dozens of homes. Reynolds Hills is concerned that adequate steps have yet to be identified or proposed to prevent such an accidental occurrence on or near our unique property.

The new 42" diameter, high-pressure gas pipeline will be in addition to the three already existing pipelines that cross under the Hudson River from Rockland County to Westchester County. The new pipeline would intersect underground in close proximity to the Indian Point nuclear power plant (that has 40 years of spent nuclear fuel rods currently housed in "temporary" spent fuel pools without radiation shielding and without adequate fire suppression abilities to stop a gas pipeline explosion), is near the Ramapo and Stamford-Peekskill earthquake fault lines, and will intersect with one (possibly two) proposed high voltage power lines. The higher volume and pressure of the natural gas and its proximity to Indian Point would also increase the risks of nuclear incidents in the Reynolds Hills' community area particularly because there is no effective evacuation strategy for such a fast moving nuclear accident triggered by a pipeline explosion and subsequent fire. These and other Indian Point issues were not addressed in the *Draft EIS*.

## Environment

The proposed pipeline expansion, maintenance and construction will directly impact our community because it will require work in, around, and over, our wetland area. The wetland has significant environmental values, particularly to our community, and provides supporting habitat and ecological and biodiversity benefits for our woodlands. The wetland is in a ravine and borders Dickey Brook. Construction in the wetland would have an impact on the brook as well, which is vital to our homes and our community because of the ecosystems services that it provides such as storm drainage and very importantly flood control which is more necessary than ever because of the extreme weather witnessed in our area due to a changing climate (*e.g.*, Hurricane Sandy and Tropical Storm Irene).

During heavy rains, the current character of our wetland will be negatively impacted by the proposal. We expect that runoff and silt would lead to additional flooding of Dickey Brook, further impacting our wetlands and making our community's single entry road impassable. The flooding of public roads would also be exasperated. Sedimentation, erosion, and potential contamination of Dickey Brook and our wetlands during construction will lower water quality. Additionally, compaction of our soil will reduce the ability for water to recharge groundwater supplies and expanding the pipeline will create a new conduit for water through the gravel surrounding the pipeline, altering the hydrologic pattern and degrading the quality and quantity of the water in the area. There has been no adequate or comprehensive analysis performed on these impacts to our wetlands in the Draft EIS.

During construction, the peace and enjoyment that are the reasons for Reynolds Hills' existence would be seriously disrupted. The disruptions will likely impact the species of flora and fauna that rely upon our wetland and likely lead to the departure of many of the species, including any protected species, that are now such an important part of our environment. The construction impacts to the ecosystem would take decades to restore, and the applicant's plans are unclear at best. These issues – disruption and post-construction activities of the applicant – have not been adequately addressed in the *Draft EIS*.

### **Health Risks Related to Air Emissions**

Reynolds Hills is also concerned about methane emissions and air contaminants from the pipeline and from the metering and regulating station across Route 9 from our community. There are documented problems with valves that Spectra energy uses in gas infrastructure projects. Methane emissions from shale gas infrastructure projects are recognized as a significant radon hazard and may contain benzene, toluene, formaldehyde and many other chemicals. Health impacts associated with emissions include nosebleeds, visual impairment, neurological and respiratory problem, leukemia, aplastic anemia, lung, liver, kidney and cardiovascular disease. The elderly and health-compromised populations of our community are particularly vulnerable.

The Westchester County area where the pipeline is located is currently a marginal non-attainment area under the Clean Air Act eight (8) hour ozone standard. For all of these potentially significant health issues for residents of our community, a formal Health Impact Assessment (HIA), as outlined by the Centers for Disease Control, should be conducted and included in a Supplemental Draft Environmental Impact Statement and provided for our review. Further, the failure to adequately address air emission and air permitting issues in the *Draft EIS* is a basis for our request for additional time, at least 90 days for comments on a Supplemental Draft Environmental Impact Statement, prior to issuing a Final Environmental Impact Statement.

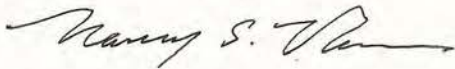

#### IV. CONCLUSION

Reynolds Hills has considerable interest in protecting the health of our members and the environmental impacts to our property – the very property of the proposed expansion, construction, and maintenance for the proposed Project. The small community nature of Reynolds Hills, the proposed destruction of its vital wetlands , and the location of metering and regulating infrastructure in close proximity are issues that have not been adequately addressed in the *Draft EIS*.

Reynolds Hills has a clear interest that may be directly affected by the outcome of the proceeding and meets the regulatory requirements to intervene set forth in 18 C.F.R. § 157.10(a)(2) and 18 C.F.R. § 385.214(b)(2)(ii) and (iii). No other party in this proceeding will be able to adequately protect these interests and the implications are substantial to our community as demonstrated by the inadequate *Draft EIS*. Accordingly, Reynolds Hills has the necessary direct and substantial environmental interest in the outcome of this process.

For the reasons set forth above, Reynolds Hills respectfully requests that this Motion to intervene be granted and that we be permitted to participate, with the full rights of a party, in the above-captioned proceeding before FERC.

Respectfully Submitted,

Nancy S. Vann  
President, Reynolds Hills, Inc.

Peekskill, New York 10566

marty walsh, peekskill, NY.

to whom it may concern, i am very much against the proposed algonquin pipeline expansion. i was initially open minded to it, but after extensive research and listening to the arguments both pro and con ive come to the conclusion that it would be a huge mistake to go ahead with the project. they are not only under insured, but it also hasnt been shown to me that the project can be performed safely

# **STOP THE ALGONQUIN PIPELINE EXPANSION!**

29 Highland Rd.  
Rye, NY 10580

September 27, 2014

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1  
Washington, DC 20426

**RE: Algonquin Incremental Market (“AIM”) Project:  
FERC Docket No. CP14-96-000**

Dear Secretary Bose:

Please accept the following comments on behalf of Intervenors Stop the Algonquin Pipeline Expansion (“SAPE”), on the Draft Environmental Impact Statement (“DEIS”) for the proposed Algonquin Incremental Market (“AIM”) Project (“Project”), particularly as it affects the counties of Rockland, Westchester and Putnam in New York State. As an Intervenor in these proceedings, SAPE urges the Federal Energy Regulatory Commission (“Commission” or “FERC”) to withdraw the DEIS and take no further action on the application until all of the matters set forth in these comments are addressed in a revised DEIS.

For the reasons explained below, the DEIS is inadequate as a National Environmental Policy Act (“NEPA”) document and a revised DEIS must be prepared with a new period for review and public comment on the proposed project to ensure that the Commission satisfies its obligations under NEPA.

**I. The Time Period Designated to Submit Comments on the DEIS is Wholly Insufficient, Violates the Public Right to Meaningful Participation, and is Contrary to the Express Purpose of NEPA**

While SAPE appreciates the additional nine (9) days that the Commission has given to the public for comment—extending the original comment period from August 6, 2014 to September 29, 2014—a comment period of just over fifty (50) days is still wholly insufficient time to properly review the DEIS and provide substantive and useful comment given the enormity and complexity of the proposed Project. The Commission should have at least doubled the comment period for a project of this scale. The DEIS

and its exhibits total well over 1,000 pages—including appendices—and discuss complex technical and scientific information, including engineering, ecological and environmental studies and data upon which the Commission relies to justify its conclusions.

To meet the proposed Project’s goals, the public should be provided appropriate time to allow for meaningful review of this lengthy DEIS with all its complexity. In that way, the public can adequately assess the study of methodologies, assumptions made and conclusions made before providing the type of meaningful comments to the Commission that NEPA expects. SAPE notes that a coalition of elected officials<sup>1</sup> recently sent a letter to the Commission requesting that the DEIS be withdrawn and a revised DEIS be released when all the missing information is complete, and that a ninety (90) day public comment period commence at that time.

Further, for many who attended the scheduled public meetings over the past week, the meetings represented the only opportunity to have their voices heard on their legitimate concerns regarding the proposed Project. The limited amount of time provided to the public for comment on the DEIS suggests that the Final EIS has already been written and that the Commission is merely going through the motions to create an illusion of meaningful public participation.

## **II. The DEIS is Grossly Incomplete and Premature**

Virtually no aspect of the DEIS is complete; its deficiencies are pervasive and substantial. Taken together they deprive the public of a meaningful opportunity to comment on the proposed plans and fail to impose enforceable mitigation prior to permitting. Significant omissions addressed in the DEIS include, but are not limited to, the following:

- Final conclusion on safety-related conflicts with the Indian Point Energy Center (“IPEC”) not provided (Section 4.12.3);
- Field Sampling Plan for potential soil contamination not provided (Section 4.2.2.6);

---

<sup>11</sup> To date, the list of politicians that have signed-on to that letter requesting additional time to review and comment on the DEIS includes, but is not limited to: New York State Senator Andrea Stewart-Cousins; New York State Senator George Latimer; Assemblyman Tom Abinanti; Assemblyman David Buchwald; Assemblywoman Sandy Galef; Assemblywoman Shelley Mayer; Assemblyman Steve Otis; Westchester Legislator Catherine Borgia; Westchester Legislator Peter Harckham; Westchester Legislator Michael Kaplowitz; Westchester Legislator Catherine Parker; Westchester Legislator MaryJane Shinsky; Westchester Legislator Lyndon Williams; Putnam Legislator Carl Albano; Putnam Legislator Sam Oliverio; Rockland Legislator Harriet Cornell; Buchanan Mayor Theresa Knickerbocker; Cortlandt Town Supervisor Linda Puglisi; Peekskill Mayor Frank Catalina; Buchanan Town Board Member Duane Jackson; Cortlandt Town Board Member Debbie Costello; Cortlandt Town Board Member Seth Freach; Peekskill City Council Member Drew Claxton; Peekskill City Council Member Kathleen Talbot; Peekskill City Council Member Vinnie Vesce; North Salem Town Board Member Amy Rosmarin; Ossining Town Board Member Victoria Gearity; Yorktown Town Board Member Nick Bianco; Yorktown Town Board Member Visnu Patel.

- Insufficient analysis of impacts to vernal pools in New York (Section 4.4.3.2);
- Non-saturated wetlands not identified (Section 4.4.4);
- Compensatory Mitigation Plan not prepared (Section 4.4.5);
- Tree survey of Harriman State Park not complete (Section 4.6.1.5);
- Alternatives for the Hudson River crossing not prepared (Section 4.4.3);
- Final plans for the Catskill Aqueduct crossing not developed (Section 4.3.2.1);
- Plans for to address trench dewatering not developed (Section 4.3.2.6);
- Survey for the presence of the Indiana bat not complete (Section 4.7.1.2);
- Survey for the presence of the northern long-eared bat not complete (Section 4.7.1.3);
- Incomplete information on impacts to migratory birds (Section 4.7.2);
- Incomplete information on impact to bald eagles (Section 4.7.3);
- Survey for the presence of Timber Rattlesnakes not complete (Section 4.7.5.1);
- NYSDOS approval of consistency assessment for Hudson Crossing (Section 4.8.4.1);
- Design modifications for New York M&R stations not complete (Section 4.11.1.2);
- Site Specific construction plan for St. Patrick Church not provided (Section 4.8.5.1);
- Site Specific construction plan for Buchanan-Verplanck Elementary not provided (Section 4.8.5.1).

These omissions go to the very heart of the question of whether the proposed Project can or should be constructed. By providing a wholly incomplete DEIS for public comment, FERC has put the public and members of SAPE in an uncertain position. Undoubtedly, the permitting of this Project should not be considered further until all of the documents and information identified on the face of the DEIS are completed and made available for review and public comment. Until this occurs, the DEIS is premature and must be withdrawn.

### **III. The Project Poses A Significant Threat to Public Health and Safety.**

The transmission of highly flammable natural gas creates significant risks of loss of life and major property damage. The greatest hazard is a fire or catastrophic explosion following a major pipeline rupture. The U.S. Department of Transportation's Pipeline and Hazardous Materials Safety Administration reports that in the past 20 years alone, on-shore gas transmission incidents have caused 41 fatalities, 195 injuries requiring in-patient hospitalization and over \$1.7 billion in property damage.<sup>2</sup>

Safety is of paramount concern to SAPE members because the proposed Project plans to replace an existing 26-inch diameter pipeline with 42-inch diameter high-pressure pipelines and to add an additional 42-inch diameter high-pressure segment across the Hudson River entering a highly populated, high risk area in Cortlandt, New York in Westchester County. As a result, the Project will allow significantly greater amounts of combustible natural gas to flow through the infrastructure, thereby presenting greater risk of hazard to the public.

FERC's conclusion that the Project will have no significant environmental impacts is unsupportable where virtually no aspect of the DEIS is complete. The public has the right to know with certainty what environmental impacts of the proposed Project will be. This is particularly true where the Project raises significant health and safety concerns that have not been sufficiently addressed in the DEIS.

#### **A. Indian Point Energy Center ("IPEC") ("Indian Point")**

A site that is of particular concern to SAPE members is the Indian Point Energy Center ("IPEC") ("Indian Point") in Buchanan, New York, located in close proximity to the proposed Project route. There are three existing gas pipelines that run under the Hudson River in Algonquin's Right-of-Way and abut the IPEC security barrier. The proposed route of the new 42-inch diameter high-pressure segment would be 0.5 miles south of the existing Right-of-Way, and would cross a portion of IPEC land less than a mile from the IPEC-protected security barrier around the main facility.

Title 10 to the Code of Federal Regulations ("C.F.R.") requires that nuclear power plants be appropriately protected against the dynamic effects and conditions that may occur outside the nuclear power plant. These events include the effects of explosion of hazardous material that may be associated with nearby industrial activities such as transportation routes such as pipelines. Since the Project's proposed route passes within the confines of the IPEC site the requirements of 10 C.F.R. §100.20 should have been considered in the DEIS.

Based almost entirely on data contained in Table 4.12.3-1 ("Existing or Potential Impact Range for the AIM Project"), the DEIS concludes that the proposed Project should not pose any new safety hazards to IPEC. However, this analysis falls short of

---

<sup>2</sup> Stakeholder Communications, US DEPT OF TRANS PIPELINE AND HAZ SAFETY ADMIN:  
<http://primis.phmsa.dot.gov/comm/reports/safety/SigPSI.html?nocache+970#ngtrans>.

adequately addressing the safety-related risk of a major failure of a high-pressure natural gas pipeline in close proximity to IPEC. This failure cannot be ignored where other publicly available evaluations of natural gas pipeline hazards have concluded that a 16-inch diameter natural gas pipeline (at 50 psi) posed an undue risk to a nuclear enrichment center.<sup>3</sup> In light of these potential dangers, the proposed Project's 42-inch diameter pipeline (at 850 psi) plainly poses an unacceptable risk to IPEC.

While we are pleased that FERC has addressed its concern regarding a pipeline explosion near the IPEC facility, its analysis of the safety-related information in connection with the Project's proximity to IPEC is woefully inadequate. Notably, for example, Algonquin is still awaiting receipt of a Hazards Analysis being performed by Entergy. Without an opportunity to review that Hazards Analysis, Algonquin has not made any final conclusions with regard to the safety of its proposed pipeline in the vicinity of IPEC. The absence of final conclusions regarding potential safety-related conflicts with IPEC suggests at the very least that the proposed Project requires additional analysis. The DEIS also fails to fully consider the risk due to seismic activity in the project area and fails to fully analyze the adequacy of Algonquin's emergency response procedures to a major explosion in the vicinity of IPEC.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file its final conclusions regarding any potential safety-related conflicts with IPEC based on the Hazards Analysis currently being performed by Entergy. SAPE respectfully requests that at minimum, Algonquin must be *required* to file its final conclusions regarding those potential safety-related conflicts and that Algonquin must make all further communication regarding potential safety-related conflicts with IPEC available to the public for review and comment.

The absence of any complete information on potential safety-related conflicts with IPEC deprives the public of a meaningful opportunity to comment on the proposed Project. A Supplemental DEIS must be prepared for review and public comment to analyze potential safety-related conflicts with IPEC. *See* Section 4.12.3.

## **B. Existing/Unknown Contaminated Sites**

It is anticipated that the Project will traverse parts of New York State that are in close proximity to existing hazardous sites and facilities. In New York alone, the DEIS identifies three properties where a release of contaminants occurred and had the potential to impact soils along the proposed pipeline route.

Potential contaminants that may be encountered in soils proximate to these facilities include VOCs, petroleum hydrocarbons, polychlorinated biphenyls and other industrial chemicals. Additional soil contamination along the proposed Project route may result from hazardous material or fuel spills during construction and/or those occurring before construction in pre-existing contaminated areas. However, Algonquin has not

---

<sup>3</sup> *See, e.g.,* The Nuclear Regulatory Commission's 2004 hazard evaluation for the National Enrichment Facility (NEF) (Accession ML0424600718), *available online*.

even completed its inventory of locations where sampling may be necessary and has not provided details to FERC on the protocols for any such additional sampling.

Based on the foregoing, the DEIS *recommends* that prior to construction of the Project, Algonquin file a Field Sampling Plan for potentially contaminated sites that could be encountered during construction, including, but not limited to, the locations of all proposed sampling, the number of samples to be taken and how and where the samples will be analyzed. SAPE respectfully suggests that Algonquin be required to make all further communication regarding the development of its Field Sampling Plan for potentially contaminated sites in New York available to the public for review and comment.

The absence of complete information on potential soil contamination along the proposed Project route deprives the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze the Field Sampling Plan for potentially contaminated sites in New York. *See* Section 4.2.2.6.

#### **IV. The Project Will Affect Numerous Unique Areas And May Cause Destruction of Significant Environmental Resources**

An astounding number of unique resource areas will be adversely affected by the Project, which will cross through several critical environmental areas.

The proposed pipeline will cross the Hudson River, an American Heritage River, as well as Harriman State Park, the Blue Mountain Reservation, the Sylvan Glen Park Preserve, Cheesecote Mountain, the Washington-Rochambeau National Historic Trail and a Village Park in the Village of Buchanan. The proposed pipeline will cross water bodies located within sub-basin level watersheds of the Lower Hudson Watershed in Rockland, Westchester and Putnam Counties. These include crossings at the Minisceongo Creek, Cedar Pond Brook and Dickey Brook, which serve as cold- and warmwater fisheries.

The exceptional value of these unique resource areas cannot be disputed. American Heritage Rivers, including the Hudson River, are so designated because they have characteristics that render them distinctive or unique. The public lands and resources protected at the state level that will be adversely affected by the Project are no less remarkable. For example, the Haverstraw to Stony Point Take-up to Relay segment will affect approximately 15 acres of diverse forested land across a section of the Harriman and Sterling Forests in Rockland County, New York. These areas support a wide variety of flora and fauna.

## **A. Wetlands & Vernal Pools**

Wetlands are areas that are inundated or saturated by surface water or groundwater at a frequency and duration to support and under normal circumstances do support, a prevalence of vegetation typically adapted for live in saturated soil conditions. Wetlands are a source of significant biodiversity and serve a variety of functions including flood control, wildlife habitat, recreational opportunities, and improving water quality.

The Project will impact approximately 25 acres of wetlands and 7 vernal pools in New York State. The Project will result in 77 wetland crossings in New York alone. In particular, the Project will impact a large wetland system (B13-RLR-W3) between about MPs 0.8 and 1.0 of the Haverstraw to Stony Point Take-up and Relay segment and the 2 vernal pools in Cortlandt, New York that are located within the temporary construction area for the Project.

Project construction activities can affect wetland resources in many ways. During construction, the primary direct impact of the Project on wetlands in New York would be the short and long-term alteration of wetland vegetation. Other direct impacts associated with the Project could include changes in wetland hydrology and water quality. These disturbances could result in altered biological activities and chemical conditions that could affect the establishment of native vegetation. Secondary impacts could include reduced riparian buffers, disturbance to adjacent habitats and incremental fragmentation. Notwithstanding the identified impacts, the DEIS concludes that the Project would not result in adverse impacts on the functions of the wetlands.

Based on the foregoing, the DEIS *recommends* that prior to construction beginning in the vicinity of the 2 vernal pools in New York, Algonquin file revised site-specific crossing plans incorporating any additional avoidance or mitigation measures for the two vernal pools as required by state agencies. SAPE respectfully requests that Algonquin be *required* to make all further communication regarding site-specific crossing plans for the two vernal pools in New York available to the public for review and comment.

Algonquin's failure to provide site-specific plans with respect to the crossing of two vernal pools in New York means that the public has had no meaningful opportunity for comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze site-specific crossing plans incorporating any additional avoidance or mitigation measures for the two vernal pools in New York. *See* Section 4.4.3.2.

### **1. Non-Saturated Wetlands & Construction Right-of-Way Width**

Algonquin's Erosion and Soil Control Plan ("E&SCP") stipulates that construction right-of-way width in wetlands be limited to 75 feet and that all additional

temporary work space should be located at least 50 feet from wetlands except where an alternative measures has been requested and approved by FERC.

Not surprisingly, Algonquin identified numerous areas (in Table 4.4.4-1) where it believed that the 75-foot right-of-way was insufficient to accommodate its wetland construction—and that a wider right-of-way was necessary. Without considering the full scope of the environmental impacts on these non-saturated wetlands and without providing data or methodology to support its determination the DEIS simply concludes that Algonquin’s modification requests for a wider right-of-way are justified. Further, the DEIS acknowledges that Algonquin’s E&SCP was not consistent with FERC Procedures with regard to construction in site-specific non-saturated wetland conditions.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file its final site-specific information regarding the location of those wetlands it believed would meet the criterion of non-saturated conditions at the time of construction. SAPE respectfully requests that Algonquin make all further information regarding the location of those wetlands it believed would meet the criterion of non-saturated conditions at the time of construction available to the public for review and comment.

Algonquin’s failure to provide any site-specific information regarding the location of non-saturated wetlands in its E&SCP deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any site-specific information regarding the location of wetlands believed to meet the criterion of non-saturated conditions at the time of construction. *See* Section 4.4.4.

## **2. Compensatory Mitigation Plan**

The majority of the wetland impacts would be on PEM (Palustrine Emergent) and PSS (Palustrine Scrub-Shrub) wetlands, with only 17 acres of PFO (Palustrine Forested) wetland impacts. About 2.5 acres of PFO wetlands would be permanently converted to non-forested conditions as a result of the Project. Algonquin developed a Compensatory Mitigation Plan to provide compensatory mitigation for both temporary impacts and permanent conversion of wetlands to another cover type.

Even though the United States Army Corps of Engineers (“USACE”) NY District indicated what it would require in terms of on-site restoration for temporary wetland impacts and off-site mitigation for permanent conversion, Algonquin has not yet developed any final mitigation plan. Further, Algonquin has not even confirmed New York’s compensatory mitigation requirements for wetland impacts and has just assumed that the proposal submitted to the USACE NY District would be acceptable to the New York State Department of Environmental Conservation (“NYSDEC”). Notwithstanding these deficiencies, the DEIS concludes that impacts on most wetland resource would be minimal and would be temporary in duration.

Based on the foregoing, the DEIS *recommends* that prior to beginning construction in New York, Algonquin file its final Compensatory Mitigation Plan, developed in consultation with USACE and NYSDEC and file documentation of consultation with these agencies regarding the Compensatory Mitigation Plan. SAPE respectfully suggests that Algonquin must be *required* to make all further communication regarding development of its final Compensatory Mitigation Plan available to the public for review and comment.

Algonquin's failure to finalize a Compensatory Mitigation Plan deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any final Compensatory Mitigation Plan. *See* Section 4.4.5.

## **B. Harriman State Park – Site Specific Plan**

Algonquin's existing right-of-way is currently recognized as existing scrub-shrub and open field wildlife habitats used by a variety of species inhabiting Harriman State Park and Blue Mountain Reservation.

Since Project construction is expected to have impacts on wildlife species that inhabit these habitats, Algonquin met with the Palisades Interstate Park Commission ("PIPC") in January 2014 to discuss the Project's impacts on Harriman State Park. As a result of the meeting, Algonquin agreed to conduct tree counts for the portions of the Project's pipeline construction located in the park to address compensation for tree removal. Algonquin still has not completed *any* tree surveys and continues to consult with the New York State Office of Parks Recreation and Historic Preservation ("NYSOPRHP") and PIPC.

Based on the foregoing, the DEIS *recommends* that, prior to construction of the Haverstraw to Stony Point Take-up and Relay segment, Algonquin file a site-specific plan for the Harriman State Park, including any avoidance or mitigation measures developed with the NYSORPH and PIPC. SAPE respectfully suggests that Algonquin be *required* to make all further communications with NYSORPH and PIPC regarding the site-specific plan for the Harriman State Park available to the public for review and comment.

The absence of any completed tree survey of Harriman State Park deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project as currently envisioned will have on Harriman State Park. *See* Section 4.6.1.5.

## **C. St. Patrick's Church (Verplanck, New York)**

St. Patrick's Church is located in the hamlet of Verplanck, New York. The Stony Point Take-up and Relay segment of the pipeline is expected to cross church property. A

new easement would be required for this crossing as it deviates from the existing right-of-way. Without mitigation, project construction will result in significant adverse impacts to the church property. For example, the project will restrict church parking, interfere with access to the church, and result in noise and dust disturbances. Notably, however, Algonquin has not filed a site-specific construction plan for the church.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file a site-specific construction plan for the St. Patrick Church developed in consultation with church leadership. SAPE respectfully suggests that Algonquin be *required* to file its site-specific plan for the church property and to make all further communications regarding its site-specific construction plan for the St. Patrick's Church available to the public for review the public for review the public for review and comment.

The absence of any site-specific construction plan for the St. Patrick's Church deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project would have on St. Patrick Church. *See* Section 4.8.5.1.

#### **D. Buchanan-Verplanck Elementary School**

The Buchanan-Verplanck Elementary School is a public elementary school serving about 300 people in Westchester County. The Stony Point to Yorktown Take-up and Relay segment of the Project would be located adjacent to the back portion of the school property between MPs 4.9 and 5.0.

The DEIS fails to adequately analyze the potential safety-related impacts of siting a 42-inch diameter high-pressure gas pipeline in close proximity to an elementary school. However, the DEIS acknowledges that, since construction activity could potentially coincide with the school year, construction noise and dust could cause a disturbance to school operations. SAPE suggests that such disturbances are, more likely, a certainty that is unacceptable both in terms of the impact on children's health and their studies.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file a site-specific construction plan for the Buchanan-Verplanck Elementary School developed in consultation with school management. SAPE respectfully suggests that Algonquin be *required* to file its site-specific construction plan and to make all further communications regarding that site-specific construction plan for the Buchanan-Verplanck Elementary School available to the public for review and comment.

The absence of a site-specific construction plan for the Buchanan-Verplanck Elementary School deprived the public and, more to the point, the parents of affected students attending the school, of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project would have on St. Patrick Church. *See* Section 4.8.5.1.

### **E. Hudson River Crossing -- Horizontal Directional Drilling (“HDD”)**

The Hudson River is the only major water body (greater than 100 feet wide) crossed by the pipeline. Algonquin plans to use the Horizontal Directional Drilling (“HDD”) crossing method at the Hudson River in New York.

In accordance with the prescribed (Delft Geotechnics) method, Algonquin completed a hydraulic fracture evaluation for the Hudson River HDD to estimate the maximum effective pressure (*i.e.*, drilling fluid pressure) that can be induced during a HDD operation within a particular soil. The results of the evaluation suggested that there exists a relatively high potential for hydraulic fracture in the soft sediments of the Hudson River HDD alignment. Despite the high risk of hydraulic fracturing using HDD, the DEIS concluded that the HDD method was an appropriate technique for installing the pipeline at the Hudson River crossing.

While the DEIS briefly assesses alternatives to the proposed route, it does so without providing any data to support its conclusion that the proposed route is the most suitable. Notably, Algonquin has not provided the Commission with a contingency plan that incorporates another location or another construction methodology for the Hudson River crossing. If the Project proceeds as planned and the HDD proves unsuccessful, Algonquin will have no alternative location or methodology identified in connection with the proposed Project’s largest water crossing. This is unacceptable.

Algonquin’s failure to develop a contingency plan that incorporates another location or another construction methodology for the HDD crossing of the Hudson River falls short of what is required under NEPA.

Algonquin’s failure to include an alternative location or methodology for the planned Hudson River crossing deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to fully examine any alternative plan considered by Algonquin for the HDD crossing of the Hudson River. *See* Section 4.4.3.

### **F. The Catskill Aqueduct Crossing**

The proposed Stony Point to Yorktown Take-up and Relay segment crosses the Catskill Aqueduct. The Catskill Aqueduct is a part of the New York City water supply system. It brings water from the Catskill Mountains to Yonkers where it connects to other parts of the system.

As currently proposed, Algonquin would remove its existing 26” pipeline that currently crosses over the aqueduct and replace those removed section(s) with 42-inch diameter pipeline. Remarkably, however, Algonquin has still not finalized its planned crossing of the Catskill Aqueduct and is still in consultation with NYCDEP regarding the crossing and evaluating an alternative route that would relocate the segment to the south.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file a site-specific crossing plan for the Catskill Aqueduct developed in consultation with the NYCDEP, containing the location relative to the aqueduct, the construction methods, timing of construction and any mitigation measures to minimize impacts. SAPE respectfully suggests that Algonquin be *required* to file its site-specific crossing plan for the Catskill Aqueduct and to make all further communication regarding the development of a site-specific crossing plan for the Catskill Aqueduct developed in consultation with the NYCDEP available to the public for review and comment.

Algonquin's failure to finalize its planned crossing of the Catskill Aqueduct deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to fully examine the extent of any impacts of the planned Catskill Aqueduct crossing. *See* Section 4.3.2.1.

### **G. Trench Dewatering**

Project construction activities could negatively affect water resources in many ways. During construction, open trenches may accumulate water, either from seepage or drainage. Where dewatering becomes necessary, the water would be removed and directed into well-vegetated uplands. However, Algonquin's Erosion and Soil Control Plan ("E&SCP") does not address the need to isolate shorter portions of trench to reduce the volume of water handled at one time.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file additional details describing how it would minimize trench dewatering as recommended by the NYSDEC and file documentation of its consultations with NYSDEC. SAPE respectfully suggests that Algonquin be *required* to file a report setting forth such additional details and to make all further communication regarding trench dewatering developed in consultation with the NYCDEC available to the public for review and comment.

Algonquin's failure to fully address trench dewatering and the need to isolate shorter portions of trench to reduce the volume of water handled at one time in its E&SCP deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project would have on trench dewatering. *See* Section 4.3.2.6.

### **V. State of New York Parkland Alienation**

The proposed Project will intrude onto parkland in the State of New York, including the Blue Mountain Reservation, the Sylvan Glen Park Reserve (note: Granite Knolls West is incorrectly considered the same as Sylvan Glen Park Reserve in the DEIS and they are not the same), Cheesecote Mountain and a Village Park in the Village of Buchanan.

New York law is well settled: dedicated park areas in New York are impressed with a public trust for the benefit of the people of the State. That proposition is reflected both in New York case law and in New York statutes. The leading New York decision on this issue is *Williams v. Gallatin*, 229 N.Y. 248 (1920), in which the Court of Appeals held that legislative approval is required when there is a substantial intrusion on parkland for non-park purposes. This requirement, moreover, exists regardless of whether there has been an outright conveyance of title and regardless of whether the parkland is ultimately to be restored. Since *Williams*, New York courts have reaffirmed the principle that parkland is impressed with a public trust, requiring legislative approval before it can be alienated or used for an extended period for non-park purposes.

Notwithstanding the still-binding legal precedent requiring legislative authorization, the Commission takes the opposite position: that the proposed Project would fall within recognized “*de minimis*” exceptions to the rule. Yet the cases cited by the Commission in support of its position are distinguishable from the facts here, in that each of those cases involved land that was found *not* to be parkland.

Respectfully, SAPE believes that the proposed Project as currently envisioned does not fall within any recognized *de minimis* exception and that the proposed Project requires legislative approval for its intrusions onto New York state parkland. In any case, the issue is not one for the parties or the Commission to decide; only a court can properly make such determination in accord with *Williams* and its progeny. See Section 4.8.5.1.

## **VI. The Project Will Have Cumulatively Significant Impacts on the Environment**

NEPA mandates that a proper EIS include a full discussion of the cumulative impacts of a proposed project. See 40 C.F.R. §1508.25(a)(2); *Kleppe v. Sierra Club*, 427 U.S. 390, 413 (1976) (“Cumulative environmental impacts are, indeed, what require a comprehensive impact statement”). An EIS must include the cumulative effects of projects if those projects are “interrelated and functionally interdependent” to the proposed action. *Stewart v. Potts*, 996 F.Supp. 668, 683 (S.D. Texas 1998). Courts have been very clear that projects must be evaluated together whenever “proceeding with one project, will, because of functional or economic dependence, foreclose options or irretrievably commit resources to future projects. *Fritiofson v. Alexander*, 772 F.2d 1225, 1241 n. 10 (5<sup>th</sup> Cir. 1985). Under 40 C.F.R. §1508.7, cumulative impacts are defined as:

the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

The DEIS’s treatment of cumulative impact falls short of NEPA requirements. The DEIS fails to consider the full scope of impacts. It also assesses the identified impacts without providing any detailed or quantified data to support the analysis.

Finally, the DEIS impermissibly relies entirely on presumed compliance with permitting requirements and mitigation plans to justify its conclusion that most of the adverse impacts environmental impacts associated with the Project would be reduced to less than significant levels.

Although it includes a small section on cumulative impacts, the DEIS failed to consider the cumulative environmental impacts associated with the planned Atlantic Bridge Project and the Access Northeast Project. Remarkably, the DEIS failed to even mention the Access Northeast Project. Since the AIM Project, the Atlantic Bridge Project and the Access Northeast Project are connected actions and thus “interrelated and functionally interdependent,” the present DEIS does not suffice to analyze their cumulative effects. *Stewart*, 996 F.Supp. at 683.

The DEIS represents that “three types of projects (past, present and reasonably foreseeable projects) could potentially contribute to a cumulative impact when considered with the proposed AIM Project.” However, the DEIS fails to consider the full scope of connected and similar actions as well as the cumulative impacts arising from the full scope of those actions. *See* Section 4.4.3.2.

## **VII. The DEIS Improperly Segments the AIM Project from Connected Actions**

One of the DEIS’s principle deficiencies is that it improperly segmented the AIM Project from other connected actions which are part of Spectra/Algonquin’s larger development plan to expand its existing pipeline system. Segmentation is a means of circumventing NEPA’s purpose by dividing a larger action into smaller proposed actions, thereby minimizing the environmental consequences of a larger plan by dividing it into several proposals for analysis in separate NEPA documents. *See Citizens’ Comm. to Save Our Canyons v. U.S. Forest Serv.*, 297 F.3d 1012, 1028 (10<sup>th</sup> Cir. 2002).

Indeed, Algonquin and its parent company, Spectra Energy, plan to modify other parts of its existing interstate pipeline system in expansions known as the Atlantic Bridge Project and the Access Northeast Project. While no formal applications have yet been filed, the DEIS acknowledges that the Atlantic Bridge Project would be similar in scope to the AIM Project and would involve facilities in the same region of influence. Nevertheless, the DEIS fails to consider the cumulative impacts of the Atlantic Bridge Project since it would “not occur at the same time” as the AIM Project and its details were unknown.

Remarkably, the DEIS makes no reference whatsoever to the Access Northeast Project, a \$3 billion dollar Spectra project that would expand the existing Algonquin pipeline from New Jersey through New York and Connecticut to Everett, outside of Boston. The Access Northeast Project is specifically intended to complement the AIM and Atlantic Bridge projects and would reportedly boost capacity on Spectra’s Algonquin (and Maritimes) pipelines by as much as 1 billion cubic feet a day, by installing new larger diameter pipelines on existing routes. FERC’s failure to analyze the Atlantic

Bridge Project and the Access Northeast Project as connected actions raises serious questions about the adequacy of the DEIS's cumulative impacts analysis.

As explained below, the Atlantic Bridge Project and the Access Northeast Project are clearly connected to the AIM Project, and thus must be reviewed, pursuant to NEPA, in the same EIS, particularly with regard to potential cumulative effects associated with the several projects. *See* 40 C.F.R. §1508.25(a).

To determine whether the AIM Project has been improperly segmented, the proper inquiry is whether the Atlantic Bridge Project and the Access Northeast Project are connected for the purposes of NEPA. Under 40 C.F.R. 1508.25(a)(1), actions are connected, meaning that they must be analyzed under the same EIS, if they:

- i) Automatically trigger other actions which may require environmental impact statements;
- ii) Cannot or will not proceed unless other actions are taken previously or simultaneously; or
- iii) Are interdependent parts of a larger action and depend on the larger action for their justification.

The purpose for the rule against segmentation is to “prevent an agency from dividing a project into multiple actions, each of which individually has an insignificant environmental impact, *but which collectively have a substantial impact.*” *Wilderness Workshop v. BLM*, 531 F.3d 1220, 1228(10th Cir. 2008) (emphasis added); *Great Basin Mine Watch v. Hankins*, 456 F.3d 955, 969 (9th Cir. 2006). In other words, the rule prevents applicants and agencies from thwarting their NEPA obligations by improperly segmenting projects into smaller components in order to avoid considering their collective impact.

Under this definition, the AIM Project, the Atlantic Bridge Project and the Access Northeast Project are plainly connected actions that must be considered together under the same EIS. The primary collective purpose of these interdependent projects is to increase Spectra/Algonquin's existing pipeline capacity and to provide it access to growing natural gas supply and demand markets.

The fact that there is no formal application currently filed by Algonquin for the Atlantic Bridge Project or the Access Northeast Project should not preclude a finding that the NEPA process was unlawfully segmented. Algonquin should not be allowed to circumvent heightened environmental scrutiny by timing its applications to FERC in an effort to manipulate the NEPA process to avoid a cumulative impact analysis of its larger development plans.

In short, we believe that the AIM Project is a wholly arbitrary subdivision of a larger development project, apparently created for the purpose of thwarting NEPA review of the cumulative effects of the project in its entirety. The DEIS fails to evaluate the AIM Project in conjunction with the Atlantic Bridge Project and the Access Northeast Project even though the three projects are clearly connected and will unavoidably create a

greater cumulative effect than might be anticipated by a focused or limited review of any one of the interrelated segments.

In *Delaware Riverkeeper Network v. FERC*, No. 13-1015 (D.C. Cir. 2014), the D.C. Circuit recently applied NEPA's segmentation policy to a pipeline project. Giving considerable deference to the applicable NEPA regulations on segmentation (40 C.F.R. §1508.25), requiring federal agencies to consider the effect of "connected actions" and "similar actions" when carrying out their responsibilities under NEPA, the Court found that where four upgrades were "physically, functionally and financially connected and interdependent," they warranted a single NEPA analysis. We suggest that this analysis should be applied to the Project.

In light of the foregoing, we question why FERC would allow the AIM Project, the Atlantic Bridge Project and the Access Northeast Project to be submitted in a piecemeal fashion without a full analysis of their cumulative impacts. We urge FERC to reevaluate Spectra/Algonquin's overarching development plans to markedly expand its existing pipeline infrastructure in New York, Connecticut, Rhode Island and Massachusetts. By omitting from the DEIS any substantive discussion of the Atlantic Bridge Project and the Access Northeast Project, FERC has effectively failed to take into account the cumulative impacts of connected projects, and has thus acted contrary to NEPA and thwarted effective review by segmenting the AIM Project.

By failing to consider the Atlantic Bridge Project and the Access Northeast Project as interdependent pieces of Spectra/Algonquin's larger development plan to expand its existing pipeline infrastructure, FERC facilitated the unlawful segmentation of the AIM project.

The DEIS's failure to consider the cumulative impacts of the Atlantic Bridge and Access Northeast projects is not cured by its cursory treatment of twelve (12) other existing or proposed projects evaluated for potential cumulative impacts analysis. Notably, the DEIS fails to provide any substantive information about the additive impacts of those actions, and instead only provides brief descriptions of the actions in Table 4.13-1. Yet the information in Table 4.13-1 fails to provide anything substantive about the projects listed or any meaningful analysis of their potential for cumulative impacts.

As a result, the DEIS is inadequate in considering the combined environmental impacts of related existing and reasonably foreseeable pipelines within the Commission's jurisdiction, and a new EIS must be prepared that includes an analysis of the cumulative impacts of those projects, including the Atlantic Bridge Project and the Access Northeast Project.

#### **A. Marcellus Shale – Natural Gas Development**

Remarkably, the DEIS fails to address the effect of the Project together with the existing or reasonable foreseeable gas development activities, most notably hydraulic fracturing that has already been determined to have impacts on seismic activity. Instead, the DEIS omits any substantive discussion of foreseeable gas development, concluding

that the resources that may be affected by shale development would not be affected by the Project and the Project would not be affected by the development in the shale region.

On its face, this conflicts with NEPA policy and federal regulation, which require an analysis of the full range of a project's impacts "whether direct, indirect, or cumulative." (40 C.F.R. 1508.8). Under NEPA, indirect impacts are defined as those that occur "later in time or farther removed in distance" and may include

...growth inducing effects and other effects related to induced changes in the pattern of land use ... and related effects on air and water and other natural systems, including ecosystems. (40 C.F.R. §1508.8).

Despite this definition, the DEIS fails to address the indirect impacts of induced gas development, specifically the extent to which the presence of the proposed Project will encourage and facilitate the development of natural gas infrastructure. The DEIS also fails to consider how environmental impacts of the proposed Project may be cumulated with the impacts of gas development in the Marcellus shale region. FERC incorrectly limits its analysis to short- and long-term impacts resulting from construction of the proposed Project, ignoring the potential for future induced development of related infrastructure in New York.

Natural gas development in and around the pipeline's service area, extending into the Marcellus shale region, is a reasonably foreseeable consequence of the Project, and its effects must be considered as cumulative impacts. To the extent the DEIS considers Marcellus Shale activities, however, it fails to provide any quantified or detailed account of such activities, or consider their cumulative impacts.

While the DEIS includes a general acknowledgement that the Commission received numerous comments during the scoping for the Project about the cumulative impacts of natural gas development (including hydraulic fracturing) in the Marcellus shale region, it simply concludes, without discussion, that the local resources affected by natural gas development activities would not be affected by the Project since they would occur more than ten miles from the Project construction area, outside the sub-watersheds crossed by the Project, and outside the air quality control regions for the Project compressor stations.

The absence of any meaningful analysis in the DEIS regarding the cumulative impacts of natural gas development failed to take the requisite hard look at the environmental impacts of the proposed Project. A revised DEIS must be prepared to detail and analyze the cumulative impacts of natural gas development (including hydraulic fracturing) in the Marcellus shale region, including impacts from other reasonably foreseeable activities such as the construction of additional pipeline, access roads, compressor stations and other infrastructure. *See* Section 4.13

## **VIII. The Project May Adversely Affect Several Endangered and Threatened Species and Their Habitat**

The U.S. Fish and Wildlife Service (“FWS”) identified seven federally listed threatened or endangered species that are known to be present in the Project area. For three of the seven species identified (the Indiana bat, Northern long-eared bat and New England Cottontail) the DEIS cited incomplete survey results. For surveys that do exist for the remaining species, the DEIS fails to describe the methodology used or to identify or analyze any data. Further, the DEIS repeatedly recognizes the loss of habitat or changes to other vegetation but fails to carefully examine the impact of those losses on endangered and threatened species.

### **A. Indiana Bat**

The inadequacy of survey results is particularly apparent for the Indiana bat, a federally listed endangered species that may be impacted by the Project. Notably, the FWS identified a section of the Stony Point to Yorktown Take-up and Relay segment as having the potential to provide suitable summer habitat for the Indiana bat. Yet despite the likely presence of Indiana bats in the Project area, Algonquin has still not completed any survey of the area for bats.

While the DEIS states that Algonquin is in consultations with the FWS to *plan* surveys and develop and implement mitigation measures, the fact that there is still no complete survey of the Project in regard to this endangered species is astounding. Further, the DEIS fails to provide any meaningful analysis of the potential for habitat destruction. The incomplete survey results, lack of habitat destruction analysis and the lack of any suggested avoidance or mitigation measures, clearly demonstrate that the DEIS is inadequate.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file all survey results, any avoidance or mitigation measures developed in consultation with the FWS and a statement regarding Algonquin’s intent to comply with those measures.

FERC’s framing here as a mere “recommendation” what should be a necessary precondition casts doubt on whether measures to mitigate harms to the species in the project area will ever be undertaken. Although a segment of the Project has been identified as having the potential to provide suitable summer habitat for the Indiana bat, FERC has not received complete survey results, nor has it sufficiently addressed habitat destruction or mitigation measures to justify approval of this Project at this time. SAPE respectfully requests that Algonquin make all further communication regarding the Indiana bat developed in consultation with the FWS available to the public for review and comment.

Algonquin’s failure to have any completed survey of the Project area for the presence of the Indiana bat deprived the public of a meaningful opportunity to comment

on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project would have on the Indiana bat. *See* Section 4.7.1.2.

## **B. Bog Turtle**

The bog turtle is a federally listed threatened turtle that is potentially present within the Project area. Based on information from the FWS, bog turtles could be present in suitable wetlands along the proposed Southeast to MLV 19 Take-up and Relay segment in Putnam County, New York. Notably, consultation with the FWS identified a known bog turtle habitat within sixteen (16) miles of the proposed Project facilities in New York.

Although Algonquin completed surveys for bog turtles and identified a known bog turtle habitat in the vicinity of the Project area, the DEIS simply concludes without explanation that the Project would not likely affect the bog turtle.

Algonquin's failure to adequately explain its methodology in reaching a determination that bog turtles would not likely be affected by the Project deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project would have on the bog turtle. *See* Section 4.7.1.2.

## **C. Northern Long-eared bat**

The northern long-eared bat, currently proposed for federal listing as an endangered species, may be impacted by the Project. Yet despite the possibility that Northern Long-eared bats are present in the Project area, Algonquin has still not completed any survey of the area.

While the DEIS states that Algonquin will be conducting surveys in connection with this species at the same time as the surveys it plans for the Indiana bat (see above), the incomplete results clearly demonstrate that the DEIS is inadequate.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file its survey results, any avoidance or mitigation measures developed in consultation with the FWS and a statement regarding Algonquin's intent to comply with those measures.

FERC's framing here as a "recommendation" what should be a necessary precondition casts doubt on whether measures to mitigate harms to the species in the project area will ever be undertaken and if so, whether such measures will be effectively designed. Although Algonquin continues to consult with the FWS to assess the potential occurrence of the Northern long-eared bat in the Project area, FERC has not received complete survey results, nor has it sufficiently addressed habitat destruction or mitigation measures to justify approval of this Project at this time. SAPE respectfully suggests that

Algonquin be *required* to make all further communication regarding the Northern long-eared bat developed in consultation with the FWS available to the public for review and comment.

Algonquin's failure to have any survey completed of the Project area for the presence of the northern long-eared bat deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project would have on the northern long-eared bat. *See* Section 4.7.1.3.

#### **D. Migratory Birds**

Potential impacts of the Project on migratory birds, including FWS Birds of Conservation Concern (BCC)-listed birds, would include temporary and permanent loss of habitat associated with the removal of existing vegetation during construction. Noise and other construction activities could also potentially affect foraging and breeding activities that occur during the nesting season. Migratory birds could also be affected by the operation and maintenance of the new facilities, including a reduction in habitat, potential increase in parasitic bird species, edge effects and ongoing disturbances associated with maintenance.

The Haverstraw to Stony Point Take-up and Relay segment of the Project as currently envisioned runs adjacent to and across the section of the Harriman and Sterling Forests' Important Bird Area (IBA) in Rockland County, New York. This diverse forested area supports a healthy representative breeding community of migratory birds which may be potentially harmed or disturbed by impacts associated with the Project, including tree removal and construction related disturbances.

While the DEIS outlines mitigation measures for Algonquin to implement to potentially minimize the proposed Project's impact on migratory birds, it states that the FWS is still reviewing the AIM Project for migratory bird impacts, and Algonquin is still in consultations with the FWS and NYSDEC. The absence of complete information as to the potential impacts of the Project on migratory birds demonstrates that the DEIS is incomplete.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file any updated consultations with the FWS Field Office in New York regarding migratory birds including and avoidance measures developed.

FERC's framing here as a "recommendation" what should be a necessary precondition casts doubt on whether effective measures to mitigate harms to the species in the project area will ever be undertaken. Although Algonquin continues to consult to assess the potential impact on migratory birds in the Project area, FERC has not received complete survey results, nor has it sufficiently addressed habitat destruction or mitigation measures to justify approval of this Project at this time. SAPE respectfully suggests that

Algonquin be *required* to make any further communication regarding migratory birds developed in consultation with the FWS available to the public for review and comment.

The absence of any final assessment by the FWS regarding the potential impact of the Project on migratory birds deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project would have on migratory birds. *See* Section 4.7.2.

### **E. Bald Eagles**

As of March 2013, adult and immature bald eagles were observed flying along the shorelines and hillsides of the Hudson River and an active nest was observed less than 3 miles from the Project. However, the DEIS does not include any substantive analysis of the impacts the Project would have on bald eagle habitats.

While the DEIS states that Algonquin is in consultation with the FWS and NYSDEC to discuss survey results and to develop and implement appropriate avoidance and mitigation measures to avoid impacts on bald eagles in the Project area, the absence of complete information on the bald eagle suggests that the DEIS is inadequate.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file any updated consultations with the FWS and NYSDEC regarding bald eagles including and avoidance measures developed.

FERC's framing here as a "recommendation" what should be a necessary precondition casts doubt on whether measures to mitigate harms to the species in the project area will ever be undertaken. Although Algonquin continues its consultation to assess the potential impacts on bald eagles in the Project area, FERC has not received complete survey results, nor has it sufficiently addressed habitat destruction or mitigation measures to justify approval of this Project at this time. SAPE respectfully requests that Algonquin make any further communication regarding bald eagles developed in consultation with the FWS or NYSDEC available to the public for review and comment.

Algonquin's failure to assess the potential impacts on bald eagles in the Project area deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project would have on bald eagles. *See* Section 4.7.3.

### **F. Timber Rattlesnakes**

The timber rattlesnake is a state-listed threatened species that inhabits deciduous forest in rugged terrain. According to NYSDEC, timber rattlesnakes are known to be present along the Stony Point to Yorktown Take-up and Relay segment of the Project. Possible impacts to the timber rattlesnake include alteration of forested habitat and direct impacts including mortality. Since Algonquin would not be able to adhere to NYSDEC's

seasonal restrictions for timber rattlesnakes, the DEIS outlined additional measures to be implemented by Algonquin to mitigate impacts to rattlesnakes.

Yet despite the likely presence of timber rattlesnakes along the Project area, Algonquin has still not completed its survey for snakes or performed any included any analysis of habitat destruction.

While the DEIS states that Algonquin is engaged in consultation with the NYSDEC to identify potential existing habitats in construction work areas in Rockland County and determine proper mitigation measures, the fact that there is still no complete survey of the Project in regard to this state-listed threatened species is disturbing. In addition, the DEIS fails to provide any meaningful analysis of the potential for any habitat destruction.

Based on the foregoing, the DEIS *recommends* that Algonquin file any results for timber rattlesnakes habitat, permit requirements, and avoidance or mitigation measures developed in consultation with the FWS and NYSDEC regarding timber rattlesnakes.

FERC's framing here as a "recommendation" what should be a necessary precondition casts doubt on whether measures to mitigate harms to the species in the project area will ever be undertaken. Although Algonquin continues to consult to assess the potential impacts on timber rattlesnakes in the Project area, FERC has not received complete survey results, nor has it sufficiently addressed habitat destruction or mitigation measures to justify approval of this Project at this time. SAPE requests that Algonquin make any further communication regarding timber rattlesnakes developed in consultation with the FWS or NYSDEC available to the public for review and comment.

Algonquin's failure to have any survey completed of the Project area for the presence of timber rattlesnakes deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project would have on timber rattlesnakes. *See* Section 4.7.5.1.

## **G. Coastal Zone Management**

The Stony-Point to Yorktown Take-up and Relay segment crosses the coastal zone management area associated with the Hudson River in the Town of Stony Point and in the City of Peekskill. The Project plans to cross the Hudson River using the HDD method to avoid impacts on aquatic resource and potential impacts on critical environmental areas.

Algonquin filed its consistency assessment application with the New York State Department of State ("NYSDOS") in February 2014 describing how the Project would be consistent with state coastal policies as well as policies of the town approved waterfront revitalization programs. To date, however, NYSDOS has yet to approve Algonquin's consistency assessment application.

Since NYSDOS has not yet concurred with Algonquin's consistency assessment application, the DEIS fails to address whether or not the Project would or would not be consistent with the above mentioned coastal zone management policies to justify approval of this Project at this time.

Based on the foregoing, the DEIS *recommends* that Algonquin file documentation of concurrence from the NYSDOS that the Hudson River crossing is consistent with New York coastal policies, including the Stony Point and Peekskill waterfront revitalization plans. SAPE requests that Algonquin be *required* to make any further communication regarding concurrence from the NYSDOS that the Hudson River crossing is consistent with New York coastal policies available to the public for review and comment.

Algonquin's failure to have its consistency assessment application approved by NYSDOS deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze whether or not the proposed Project's Hudson River crossing is consistent with New York coastal policies. *See* Section 4.8.4.1.

## **IX. Analysis of Air Quality and Climate Change Impacts is Inadequate**

As discussed below, the DEIS dramatically underestimates the extent to which Project construction and operation will emit air pollutants and fails to present a comprehensive analysis of the direct, indirect and cumulative effects of the Project on air quality.

The DEIS acknowledges that construction and operation of the proposed Project will result in significant emissions of various air pollutants, including NO<sub>x</sub>, VOCs, carbon monoxide, particulate matter, sulfur dioxide and GHGs. These pollutants affect air quality—and therefore human health—in a variety of ways. NO<sub>x</sub> is a precursor of both ozone and fine particulate matter. VOCs are also an ozone precursor. Fine particulate matter is linked to increased heart attacks, aggravated asthma and decreased lung function, and for people with heart or lung disease, premature death. Ozone exposure can lead to coughing, chest pain and throat irritation. It also exacerbates pre-existing bronchitis, emphysema and asthma and can reduce lung function.

With the exception of sections exploring whether air emissions trigger regulatory requirements, the DEIS does not undertake any analysis of the potential impacts on those who may be at risk of exposure to the HAPs. FERC's failure to undertake any meaningful analysis of the effects of emissions from Project construction and operation is particularly concerning, given that the proposed Project would result in significant emissions of NO<sub>x</sub> and VOCs. *See* Section 4.4.3.2.

### **A. Compressor Stations / M&R Stations**

The compressor stations in New York are already major sources of Hazardous Air Pollutants (HAPs). Peer-reviewed scientific studies indicate that emissions from

compressor stations and other shale gas infrastructure are associated with negative health impacts. Current emissions will be significantly increased by the expansion of the Southeast and Stony Point compressor stations, and the region including Putnam, Rockland and Westchester counties is already considered a non-attainment zone for air quality standards according to the United States Environmental Protection Agency (USEPA).

Submissions made by Algonquin (Resource Report #9 in Docket CP12-96-000) do not reflect the aggregate (existing or proposed) and cumulative emissions from compressor stations, metering stations and pipelines for the Project. In addition, modifications are needed to the M&R stations in Peekskill, Cortlandt and Stony Point, New York, to connect the existing valve to the new 42-inch diameter pipeline. However, the design modifications are still not complete.

Without considering any proposed design modification to the M&R stations, the DEIS largely dismisses the impacts of air pollution, and concludes that modeling analysis for all modeled pollutants would not contribute to a violation of the National Ambient Air Quality Standards (NAAQS). Since Algonquin's M&R design modifications are not yet complete, the DEIS could not have addressed the unknown.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin provide an update regarding the air permitting requirements associated with the modification to the M&R stations in New York, as well as any application filed with NYSDEC regarding air permitting/registration. SAPE requests that Algonquin be *required* to provide its update requiring the air permitting requirements and that it be further *required* to make any further communication regarding the air permitting requirements associated with the modification to the M&R stations in New York available to the public for review and comment.

The absence of any completed design modifications for the M&R stations in New York deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze the final design modifications for the M&R stations in New York. *See* Section 4.11.1.2.

## **B. Fugitive Emissions**

The DEIS fails to adequately address fugitive emissions from the proposed Project. The DEIS provides an annual estimate of these emissions in Table 4.11.1-13, but that table fails to provide any basis for those estimates. In particular, the DEIS provides no analysis of potential malfunctions of either pipeline or compressors that could lead to unintended emissions of various HAPs. This is a significant oversight, given that the PHMSA reported *nearly 300 significant pipeline incidents* in 2013. The data makes clear that spills, explosions and other unintended releases of pollutants from pipelines occur with a measurable degree of frequency. The resulting—and equally predictable—emissions should be taken into account as part of the DEIS's assessment of the impacts associated with the Project.

The DEIS's failure to adequately address fugitive emissions from the proposed Project and further, its failure to provide any data or methodology to support its conclusion, deprived the public of a meaningful opportunity to comment on the proposed Project and failed to take the requisite hard look at the proposed Project's environmental impact. A revised DEIS must be prepared for review and public comment to adequately address fugitive emissions from the proposed Project. *See* Section 4.11.1.3.

### **C. Cumulative Impacts on Air Quality**

As discussed *supra*, the DEIS's analysis of cumulative impacts of the proposed Projects on air quality is insufficient. The DEIS concedes that the construction and operation of the Project will contribute cumulatively to air quality impacts, but concludes that it does not anticipate that the construction and operation of the proposed Project facilities will have a significant impact on air quality. Although it is unclear exactly to what extent the DEIS has calculated the potential emissions from other projects and included them in its cumulative impact analysis, the DEIS nonetheless discounts the impacts of those projects without offering any justification for such discounting of those dangers.

The DEIS's failure to adequately address the cumulative impacts of the proposed Projects on air quality deprived the public of a meaningful opportunity to comment on the proposed Project. Moreover, the DEIS failed to take the requisite hard look at the proposed Project's environmental impact. A revised DEIS must be prepared for review and public comment to adequately address the cumulative impacts of the proposed Projects on air quality. *See* Section 4.13.7.

### **D. Climate Change**

The DEIS fails to undertake a meaningful analysis of the climate change impacts of GHG emissions, including fugitive GHG emissions, which would result from the construction and operation of the Project. The DEIS concludes, without pointing to any evidence in support of its conclusion, that emission of GHGs from the proposed Project would not have any direct impacts on the climate change in the Project area. As discussed *supra*, this conclusion fails to take into account the likelihood of a significant incident with the pipeline, resulting in a spill, leak, explosion or other unintended emission of GHGs.

The absence of any meaningful analysis of the climate change impacts of GHG emissions associated with this Project deprived the public of a meaningful opportunity to comment on the proposed Project. The DEIS, moreover, failed to take the requisite hard look at the proposed Project's environmental impact. A revised DEIS must be prepared for review and public comment to analyze the climate change impacts of GHG emissions associated with this Project. *See* Section 4.13.8.

## **VII. Environmental Justice**

In New York, environmental justice communities are defined according to the following thresholds: communities where 23.6 percent of the individuals within a given census block are living below the poverty line as low-income populations; and/or communities where minorities comprise more than 51.1 percent of the population within a given census block as minority populations. Low income communities and communities of color have historically been overburdened as a result of air pollution from energy-generating facilities. In particular, the proposed Project would have adverse impacts on neighborhoods within a 12.5-mile radius of downtown Peekskill, New York, an area that is already home to more than its fair share of hazardous waste facilities.

The primary adverse impacts on the environmental justice communities associated with the construction of the Project would be the temporary increases in dust, noise and traffic from the Project construction. These adverse impacts would occur along the entire pipeline route. However, the DEIS does not provide sufficient financial analysis of the Project to effectively determine if the Project would result in a disproportionately high and adverse impact on these minority and low-income populations.

Other than acknowledging that two census block groups crossed by the Project in Westchester County have minority populations greater than the minority threshold, the DEIS lacks any meaningful analysis of environmental justice issues. The lack of any discussion of the costs of the Project, including a full analysis of the discarded alternatives, prevents any meaningful understanding of the impact upon environmental justice communities.

The absence of any meaningful analysis in the DEIS of the proposed Project's impact on environmental justice issues along the pipeline route failed to take the requisite hard look at the proposed Project's environmental impact. A revised DEIS must be prepared for review and public comment to analyze the impact on environmental justice issues along the pipeline route. *See* Section 4.9.10.

## CONCLUSION

For all of the reasons stated above, the DEIS is premature, incomplete, unsupported by evidence and fails to adequately consider the direct, indirect and cumulative impacts of the proposed Project. The proposed Project is unnecessary, improperly located in close proximity to a nuclear power facility, with significant environmental impacts that have not been fully addressed in the DEIS. The defects in the DEIS are fundamental and pervasive. We therefore request that the Commission: (1) take no further action with respect to permitting of the proposed Project on the basis of this profoundly flawed DEIS; and (2) prepare a revised DEIS with a new period for review and public comment to ensure that the FERC satisfies its obligations under NEPA.

Respectfully submitted,

Stop the Algonquin Pipeline Extension (SAPE)

**Subject:**

Algonquin Gas Transmission, LLC  
Docket No. CP14-96-000  
FERC/EIS-0254D

Dear Ms. Bose

I am submitting the following comments on behalf of myself on the above-proposed project. I am a registered Professional Engineer with more than 45 years of Nuclear safety, engineering operation and Federal regulatory requirements.

I have been a consultant to the Chief Nuclear Officers at Indian Point and also an expert witness for the Attorney General for the State of New York related to the relicensing efforts of Indian point.

In October 2010<sup>1</sup> I petitioned<sup>2</sup> the Nuclear Regulatory Commission (NRC) to evaluate the risks associated with the existing gas lines. The NRC in its response stated this analysis had been conducted however they would not share it with me due to national security concerns.

I have conducted a detailed review of the Draft Environmental Impact Statement (DEIS) and the requirements as stated in 49 CFR 192 “Transportation of natural and other gas by pipeline: Minimum federal safety standards” and also 30 CFR Part 380, Appendix A to Part 380 – “Minimum Filing Requirements for Environmental Reports Under the Natural Gas Act.”

---

<sup>1</sup> <http://pbadupws.nrc.gov/docs/ML1030/ML103020293.pdf>

<sup>2</sup> <http://www.huffingtonpost.com/huff-wires/20101025/us-indian-point-gas-line/>

Based upon these Federal requirements I have the following comments related to the DEIS and the Spectra application:

1. 30 CFR 380 (m), Reliability and Safety explicitly states:

*“Describe how the project facilities would be designed, constructed, operated, and maintained to minimize potential hazard to the public from the failure of project components as a result of accidents or natural catastrophes. (§ 380.12(m)).”*

This proposed line is located in the vicinity of residents, schools, churches and one of the largest nuclear plants in the USA. 49 CFR 192 discusses various design requirements for safety. I note that the new lines are not designed to the most stringent safety requirements of Class 4 lines. Contrary to these requirements I did not see any discussion within the DEIS or the application discussing what provisions would be incorporated to minimize the impact to the public and why these lines are not designed to the maximum safety standards specified by 49 CFR 192.111 and 49 CFR 192.5. These standards would require closer isolation valve spacing, and more robust pipes designed to withstand higher pressures. While not a specific requirement to design these lines as Class 4, it was never anticipated that gas transmission lines would be located near or on the property of a nuclear power facility.

There is no discussion in either the AIM proposed description or the DEIS as to automatic isolation valves which had been removed from the original gas lines. The only isolation valves are controlled from Houston, Texas and there is no assurance these will be operable due to an earthquake or other natural disaster.

2. The White Plains Journal News published the following Community View on September 15, 2014. Some of these may be new issues however none of these issues have been addressed in either the DEIS or the Spectra Application.

***“View: Algonquin plan poses risks to Indian Point, residents***

*Paul Blanch 10 p.m. EDT September 14, 2014 Spectra plans to place a larger gas pipeline near Indian Point. The probability of a gas line failure is remote but is not zero. It is unconscionable and irresponsible to continue this project prior to a complete, independent risk analysis.*

*Nuclear power plants and natural gas transmission lines provide energy for homes and businesses. Due to the inherent hazards associated with these energy sources, the federal government "regulates" both. The proposed routing of the Algonquin natural gas pipeline near the Indian Point nuclear plant poses the risk that these hazards may team up to harm the community.*

*I speak as a professional engineer with more than 45 years of nuclear experience including formerly reporting directly to the Chief Nuclear Officer at Indian Point and an expert witness for the State of New York related to the relicensing of Indian Point.*

*There are three gas existing natural gas transmission lines traversing the Indian Point site within 600 feet of vital structures. There has not been any publicly available analysis demonstrating the risks of these lines. The Nuclear Regulatory Commission has refused to provide this information under the guise of national security, yet has maintained the "secret" analysis shows Indian Point is not at undue risk.*

*Failure of any of these lines could result in a total loss of cooling to the reactor cores and 40 years inventory of spent fuel. There are no provisions within the area to combat this event until valves are remotely closed from the pipeline company's facility in Houston, Texas. In the meantime, the energy released from a ruptured line in one hour would exceed the energy released from one of the atomic bombs dropped on Japan in 1945.*

*Some of the possible consequences of a gas line fire/explosion to Indian Point include loss of power to the entire site, secondary fires from liquid fuel storage tanks, reactor core damage and melting, asphyxiation of site personnel, spent fuel radioactivity releases exceeding those of Fukushima, and social/economic damages exceeding \$1 trillion.*

*Now Algonquin/Spectra wants to place yet another high-pressure 42-inch line also in the vicinity of Indian Point, doubling the existing*

*capacity. According to the Federal Energy Regulatory Commission, "the proposed route would not pose any new hazard to the (Indian Point) facility." There is no way FERC could make this determination without a complete risk analysis. And FERC's Draft Environmental Impact Statement ignores damage prevention, emergency response and public awareness, which are federal Department of Transportation requirements.*

*Algonquin gas pipeline project sparks safety concerns*

*An independent study of a gas pipeline near a nuclear facility in another state concluded it represented an undue risk. The amount of gas flow and energy in that pipeline was less than 1/1000 of the Algonquin/Spectra project and the facility was located in an area with much lower population.*

*The probability of a gas line failure is remote but is not zero especially if terrorism is considered. This may possibly be one of the most attractive targets in the nation.*

*The event would be aggravated by the decision of Spectra to not include any automatic gas termination valves and no means to combat the fire/explosion prior to gas flow termination. The gas lines are not designed to the most stringent safety standards as discussed in DOT regulations. The only gas isolation valves are remotely controlled from Houston, Texas. It seems the community around Indian Point is protected against a gas pipeline rupture triggering a nuclear plant accident—unless a gas pipeline ruptures. That's unacceptable.*

*The State of New York and all of the impacted counties must demand an independent and transparent analysis be conducted by an independent engineering organization. The cost for this study should be borne by Spectra/Entergy.*

*It is unconscionable and irresponsible to continue this project prior to a complete, independent risk analysis. The potential consequences of this event are too devastating to the New York area and my home State of Connecticut not to design this new line to maximum safety standards and assess the risk.*

*The writer, a West Hartford, Conn., resident, is an engineer.”*

3. 30 CFR Part 380 also requires:

- (1) Describe measures proposed to protect the public from failure of the proposed facilities (including coordination with local agencies).
- (3) Discuss design and operational measures to avoid or reduce risk.
- (5) Describe measures used to exclude the public from hazardous areas. Discuss measures used to minimize problems arising from malfunctions and accidents (with estimates of probability of occurrence) and identify standard procedures for protecting services and public safety during maintenance and breakdowns.

Again, none of these requirements met or addressed.

4. Page ES-8 FERC DEIS states:

*“Algonquin identified that because of the distance of the proposed Project from the IPEC generating facilities and the avoidance and mitigation measures that it would implement, the proposed **route would not pose any new safety hazards to the IPEC facility.** To ensure that the AIM Project would not present new safety hazards to the IPEC facility, we are recommending that Algonquin file the final conclusions regarding any potential safety-related conflicts with the IPEC based on the Hazards Analysis performed by Entergy.”*

This is one of the most egregious statements within the DEIS and is an irresponsible and rash statement with no bases. The Nuclear Regulatory Commission (NRC) has reviewed similar analysis at nuclear facilities nuclear facilities with 1/1000 of the proposed gas flow and located more than one mile from the facility and determined that a 16-inch operating at 50-PSI. The study

performed by Framatome determined gas line presented undue risk to the facility. Any analysis conducted with a foregone outcome as stated within the DEIS is completely unscientific and irresponsible. It should be FERC's responsibility to assure this analysis is conducted in an open, scientific, transparent independent manner with a peer review. This analysis cannot be conducted by any organization with a vested interest such as Spectra/Algonquin, Indian Point/Entergy or the Nuclear Regulatory Commission.

West Point Partners, LLC ("WPP") proposes to construct and operate the West Point Transmission Project ("the Project"), an approximately 80-mile-long high voltage electric transmission facility that will connect the existing National Grid Leeds Substation (Leeds Substation) in the Town of Athens, Greene County, NY, and the existing Consolidated Edison Company of New York, Inc. (Con Edison), Buchanan North Substation (Buchanan Substation) located adjacent to the Indian Point Energy Center in the Village of Buchanan, Town of Cortlandt, Westchester County, NY. For approximately 77 miles of its length, the Project will be buried under the bed of the Hudson River.

Both the American Society of Civil Engineers<sup>3</sup> and the National Association of Corrosion Engineers clearly state<sup>4</sup> that high voltage direct current (HVDC) lines will induce "stray currents" which will accelerate the corrosion of metallic piping systems. This HVDC line will directly intersect with both the new and 60 year old degrading existing gas transmission lines and piping systems and tanks at the Indian Point facility.

49 CFR Part 192, Appendix D to Part 192 - Criteria for Cathodic Protection and Determination of Measurements require this to be addressed and measures implemented to assure that there will be no impact or stray current corrosion induced by the HVDC lines in the proximity of the gas lines.

---

<sup>3</sup> <http://ascelibrary.org/doi/abs/10.1061/9780784413142.093>

<sup>4</sup> <http://www.nace.org/cstm/Store/Product.aspx?id=b7a6056e-bb57-df11-a321-005056ac759b>

5. 49 CFR 192.615<sup>5</sup> requires “each operator shall establish written procedures to minimize the hazard resulting from a gas pipeline emergency.”

There is no discussion within the DEIS as to how this problem will be addressed especially when remotely operated valves are controlled from Houston, Texas.

6. 49 CFR §192.616 Public awareness requires “each pipeline operator must develop and implement a written continuing public education program that follows the guidance provided in the American Petroleum Institute's (API) Recommended Practice (RP) 1162 (incorporated by reference, *see* §192.7).”

There is no discussion within the DEIS of the application as to how this is being addressed. This public education process must include the potential consequences of impact to the Indian Point nuclear plants and how an accident would be minimized.

7. The requirements of 49 CFR 192 Subpart L—OPERATIONS<sup>6</sup> TRANSPORTATION OF NATURAL AND OTHER GAS BY PIPELINE: MINIMUM FEDERAL SAFETY STANDARDS are not addressed within the DEIS.
8. 30 CFR Part 380 states: “Describe measures used to exclude the public from hazardous areas. Discuss measures used to minimize problems arising from malfunctions and accidents **with estimates of probability of occurrence** (emphasis added) and identify standard procedures for protecting services and public safety during maintenance and breakdowns.”

There is no discussion within the DEIS as to how these requirements are addressed especially the probability and

<sup>5</sup>[http://www.ecfr.gov/cgi-bin/text-idx?SID=feed3509ef9a6b39ee12360353228fd6&node=se49.3.192\\_1615&rgn=div8](http://www.ecfr.gov/cgi-bin/text-idx?SID=feed3509ef9a6b39ee12360353228fd6&node=se49.3.192_1615&rgn=div8)

<sup>6</sup><http://www.ecfr.gov/cgi-bin/text-idx?SID=feed3509ef9a6b39ee12360353228fd6&node=sp49.3.192.1&rgn=div6>

consequences of an accident and/or malfunction.

9. Based on the results of the Fukushima nuclear meltdowns the Social and Economic consequences may exceed \$1 Trillion should an accident occur with consequential damage due to proximity to Indian Point and NYC. Consequential damages from secondary fires and explosions from the millions of gallons of fuel oil stored on the Indian Point site must also be considered
10. The Nuclear Regulatory Commission has specifically notified<sup>7</sup> all nuclear facilities of the potential dangers of locating gas lines in the vicinity of nuclear plants. Neither the Spectra application nor the DEIS address this major risk.

There is no discussion of the potential for preventing terrorism and the impacts of such an event.

As stated in the DEIS: “To ensure that the AIM Project would not present new safety hazards to the IPEC facility, we are recommending that Algonquin file the final conclusions regarding any potential safety-related conflicts with the IPEC based on the Hazards Analysis performed by Entergy.

It is imperative that this “Hazards Analysis” be performed by an independent, qualified party with oversight from representatives from local legislators and residents.

In summary, the proposed AIM project poses extreme dangers to the residents of Westchester County and surrounding areas that include pipe corrosion to the new and existing gas lines, damage due to installation and subsequent construction accidents, and other events that may impact the environment.

**UNITED STATES OF AMERICA  
BEFORE THE  
FEDERAL ENERGY REGULATORY COMMISSION**

**Algonquin Gas Transmission, LLC**

)  
)  
)

**Docket No. CP14-96-000**

**COMMENTS OF ENTERGY NUCLEAR INDIAN POINT 2, LLC, ENTERGY  
NUCLEAR INDIAN POINT 3, LLC AND ENTERGY NUCLEAR OPERATIONS, INC.  
ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT FOR ALGONQUIN  
INCREMENTAL MARKET PROJECT**

Pursuant to the Federal Energy Regulatory Commission’s (“FERC” or “Commission”) Notice of Availability of the Draft Environmental Impact Statement for the Proposed Algonquin Incremental Market Project, issued on August 6, 2014 in the above-captioned docket, Entergy Nuclear Indian Point 2, LLC, Entergy Nuclear Indian Point 3, LLC and Entergy Nuclear Operations, Inc.<sup>1</sup> (collectively, “Entergy”) hereby submit these comments concerning the draft environmental impact statement (“Draft EIS”) for the Algonquin Incremental Market Project (“AIM Project”).

**I. BACKGROUND**

On June 18, 2013, Algonquin Gas Transmission, LLC (“Algonquin”) submitted a request to FERC to use the Pre-Filing review process for the AIM Project. The Commission granted Algonquin’s request and subsequently issued a Request for Comments on Environmental Issues.

Entergy owns and operates the Indian Point Energy Center (“IPEC”), a nuclear-powered generating facility located at Buchanan, New York.<sup>2</sup> Algonquin’s existing pipeline system uses

<sup>1</sup> Entergy Nuclear Operations is a service company that represents certain of its affiliates in operational and regulatory matters, including representing them in Commission proceedings.

<sup>2</sup> IPEC has three nuclear units. IPEC Units 2 and 3 (“IP2” and “IP3”) are operating nuclear power plants; IPEC Unit 1 (“IP1”) is permanently shut down but certain IP1 systems and components interface with and in some cases support the operation of IP2 and IP3. Entergy Nuclear Operations, Inc. operates IP2 and IP3 as agent for Entergy Nuclear Indian Point 2, LLC and Entergy Nuclear Indian Point 3, LLC, the owners of IP2 and IP3,

an easement for three pipelines that cross the Hudson River at the IPEC property site. One of the AIM Project's original proposed routes (referred to as the "Northern Route") would continue to rely on this easement to cross IPEC's property. Accordingly, Entergy submitted National Environmental Policy Act ("NEPA") scoping comments to help FERC understand the safety, environmental, and nuclear regulatory considerations involved in the AIM Project as they may impact IPEC. Entergy wrote that it was necessary to determine, before FERC approval of the AIM Project, that expanding from a 26-inch diameter pipeline to a 42-inch diameter pipeline operating at higher capacities and pressure would not pose an increased nuclear safety risk in case of a postulated malfunction or failure of the expanded natural gas pipeline located near IPEC.<sup>3</sup> Specifically, Entergy's comments explained that "NRC regulations require that nuclear power plant structures, systems and components important to safety be appropriately protected against dynamic effects resulting from equipment failures and other events and conditions that may occur outside a nuclear power plant, including the effects of explosions of materials that may be carried near the nuclear facility such as natural gas."<sup>4</sup>

On February 28, 2014, Algonquin submitted an application for a certificate of public convenience and necessity, pursuant to section 7(b) and 7(c) of the Natural Gas Act and Part 157 of the Commission's regulations for the AIM Project.<sup>5</sup> On April 8, 2014, Entergy submitted a motion to intervene with comments in this docket. Entergy explained that due to the proximity

---

respectively, pursuant to an Operating Agreement. Entergy Nuclear Operations, Inc. and Entergy Nuclear Indian Point 2, LLC hold the operating and owner's licenses, respectively, issued by the Nuclear Regulatory Commission ("NRC") for IP2. Entergy Nuclear Operations, Inc. and Entergy Nuclear Indian Point 3, LLC hold the operating and owner's licenses, respectively, issued by the NRC for IP3.

<sup>3</sup> *Algonquin Gas Transmission, LLC*, NEPA Scoping Comments of Entergy Nuclear Operations, Inc. at 4, Docket No. PF13-16-000 (Oct. 14, 2013) (citing U.S. Nuclear Regulatory Commission Regulatory Guide 1.91, Rev. 2, Evaluations of Explosions Postulated to Occur at Nearby Facilities and on Transportation Routes Near Nuclear Power Plants (Apr. 2013)).

<sup>4</sup> *Id.*

<sup>5</sup> *Algonquin Gas Transmission, LLC*, Abbreviated Application of Algonquin Gas Transmission, LLC for a Certificate of Public Convenience and Necessity and For Related Authorizations, Docket No. CP14-96-000 (Feb. 28, 2014) ("Certificate Application").

of the AIM Project to IPEC, Entergy—as the owner and NRC-licensed operator of IPEC—has a demonstrated interest in the AIM Project, and no other party can adequately represent Entergy’s interests.<sup>6</sup>

Entergy noted in its NEPA scoping comments that the existing Algonquin pipeline system has been operating safely next to IPEC for several decades, and several evaluations of the potential hazards posed by the existing pipelines, conducted pursuant to NRC regulations and guidance, establish that the existing pipelines do not impair the safe operation of IPEC.<sup>7</sup> These analyses are part of the NRC design and licensing basis for both IP2 and IP3.<sup>8</sup> The proposed AIM Project, however, significantly expands the existing Algonquin system, including pipeline capacity and pressure. Thus, the potential for increased nuclear safety risks, including in terms of the probability and consequences of a potential malfunction or failure of the expanded natural gas pipeline near IPEC, must be evaluated in advance and found to be acceptable in accordance with applicable NRC regulations before implementing the proposed change. While such occurrences are unlikely, Entergy must analyze any increased risk and consequences of such events prior to FERC’s approval of the project. Depending on the results of the analysis, prior NRC review and approval of the new hazards analysis could be required before the project can be approved by FERC. As part of its review, NRC could request further information on the project or require additional measures to mitigate any potential hazards to IPEC. Such issues would have to be addressed before NRC could complete its review.

---

<sup>6</sup> *Algonquin Gas Transmission, LLC*, Motion to Intervene and Comments of Entergy Nuclear Indian Point 1, LLC, *et al.* at 4, Docket No. CP14-96-000 (April 8, 2014).

<sup>7</sup> The NRC has independently evaluated the external hazards posed by these pipelines several times, including pre-licensing in 1973 and more recently in 2003 and 2008. Those evaluations considered the design and construction of the gas lines, operations and maintenance practices, postulated failure modes, and standoff distances to safety-related structures. NRC’s reviews have concluded that the existing pipelines do not adversely affect the safety and security of the plant. *See* Letter from NRC to the Honorable Sandra R. Galef, New York State Assembly, dated March 20, 2014 (ADAMS Accession No. ML14069A370).

<sup>8</sup> *See* IP3 Updated Final Safety Analysis Report (“UFSAR”), Rev. 3, Section 2.2.2, describing the existing pipelines and referencing a 2008 evaluation of potential hazards posed by the pipelines.

Entergy noted in its motion to intervene and comments that it had conducted a preliminary analysis of the alternatives described in Algonquin's Resource Report No. 10 and concluded that an expanded pipeline along the alternative Northern Route crossing of the Hudson River, in the existing easement, could introduce increased hazards to certain safety-related structures near or on the IPEC site. Accordingly, advance NRC review for the Northern Route crossing alternative would likely be required.<sup>9</sup> Algonquin's preferred Southern Route crossing, with its greater distance from IPEC safety-related structures (approximately .5 miles south of the existing crossing), did not appear to raise the same safety-related concerns, but advance NRC review and approval may also be necessary based on the Southern Route's proximity to other IPEC systems, structures, and components that, while located outside of the main plant area, are important to safety. Entergy noted that it was continuing its review of the AIM Project and alternatives and would provide further comments to FERC in accordance with the environmental review schedule.

## **II. COMMENTS ON DRAFT EIS FOR AIM PROJECT**

On August 6, 2014, FERC issued the Draft EIS for the AIM Project.<sup>10</sup> As it relates to IPEC, the Draft EIS states as follows:

Based on our consultation with NRC, Entergy is required to assess any new safety impacts on its IPEC facility and provide that analysis to the NRC. Algonquin has coordinated with Entergy to provide information about its proposed pipeline, and Entergy is currently performing a Hazards Analysis. To ensure that no new safety hazards would result from the AIM Project, we are recommending that Algonquin file the final conclusions regarding any potential safety-related conflicts with the IPEC based on the Hazards Analysis performed by Entergy.<sup>11</sup>

<sup>9</sup> Whether NRC would approve the proposed change would depend on the results of the Safety Evaluation and Hazards Analyses.

<sup>10</sup> *Algonquin Incremental Market Project, Draft Environmental Impact Statement*, Docket No. CP14-96-000 (August 6, 2014).

<sup>11</sup> Draft EIS at 5-15. The Draft EIS contains environmental hazard mitigation recommendations by FERC Staff, including the recommendation that Algonquin be required to file with FERC any potential safety-related conflicts with IPEC based on Entergy's Hazards Analysis and the recommendation that "[i]f, upon completion of the Hazards Analysis, additional mitigation measures are required to address safety-related issues or conflicts, prior to

FERC's conclusions in the Draft EIS were also based, in part, on the comments Entergy submitted to FERC to assist the Commission in identifying issues for evaluation in the EIS, referenced above.

As noted in Section I above, the 2008 evaluation of potential impacts posed by the existing natural gas pipelines on IPEC is referenced in the IP3 UFSAR and is part of the formal NRC design and licensing basis for IP2 and IP3. NRC's regulations in 10 C.F.R. § 50.59 require that proposed changes to (or potentially affecting) the nuclear plant be reviewed in advance for potential impacts on the plant's licensing basis. Such review is often undertaken in the form of a written Safety Evaluation. If the proposed change as considered in the Safety Evaluation satisfies one or more of the criteria in 10 C.F.R. § 50.59, prior NRC review and approval—in the form of a license amendment—is required.<sup>12</sup> If not, the licensee is allowed to make the change without prior NRC approval. Nevertheless, such changes are still subject to regulation and oversight by the NRC. For example, 10 C.F.R. § 50.59 Safety Evaluations are subject to inspection, examination and potential enforcement action by NRC. Further, a licensee must periodically submit a summary of the Safety Evaluations to the NRC for review. Thus, the NRC monitors changes to a plant (or its environs, as in this case) and may take or require remedial action including mandating changes to or disapproval of the proposed action.

As noted in the EIS, Entergy has worked closely with Algonquin over the past year to better understand the scope of the project, including proposed alternate routes, and to confer regarding means to avoid any potential adverse impacts to IPEC. These discussions have primarily focused on the final selected pipeline routing—the Southern Route. As discussed

---

construction in the vicinity of the IPEC facility, Algonquin shall file with the Secretary, for review and written approval by the Director of OEP, a site-specific construction and mitigation plan for the IPEC developed in consultation with Entergy.” *Id.* at 5-25 (emphasis in the original) (the “Hazard Mitigation Measures”).

<sup>12</sup> See 10 C.F.R. § 50.59(c)(2).

below, Entergy would at this time oppose the alternate Northern Route or any other alternative routes that result in routing the new 42-inch diameter piping materially closer to IPEC.

#### **A. Evaluation of the Proposed Southern Route**

The Southern Route is further from IP2 and IP3 structures, systems and components (“SSCs”) within the IPEC Security Owner Controlled Area (“SOCA”), which is used to control access to the main plant area, than Algonquin’s existing pipeline system and the alternate Northern Route. However, the proposed new pipeline of the AIM Project has a larger diameter and operates at a higher pressure than the existing pipelines, thereby allowing it to transport larger volumes of natural gas. Also, the Southern Route is nearer to certain SSCs important to the safe and efficient operation of IP2 and IP3, including the Gas Turbine (“GT”) 2/3 Fuel Oil Storage Tank, Electrical Switchyard, Emergency Operations Facility (“EOF”), Meteorological Tower, and the City Water Tank. Accordingly, the new 42-inch pipeline would result in a change to IP2 and IP3 external hazards licensing basis, which did not consider such impacts. The impact of the AIM Project therefore must be evaluated in advance of construction pursuant to 10 C.F.R. § 50.59.

Given the proximity of the Southern Route to the above-listed SSCs, Algonquin and Entergy have conferred regarding means to avoid potential adverse impacts to the safe operation of IPEC. As a direct result of those efforts, Algonquin has agreed to implement additional Southern Route design and installation enhancements along approximately 3,935 feet of the pipeline to be located along the Southern Route in the Town of Cortlandt, near Broadway (MPs 4.6 to 5.3) (the “AIM Project IPEC-Related Safety Enhancements”). The AIM Project IPEC-Related Safety Enhancements include: (a) using 0.720 inch wall thickness and X-70 grade pipe that exceeds the most stringent Class 4 requirements set by US DOT; (b) installing two parallel

sets of fiber-reinforced concrete slabs (3 feet wide by 8 feet long by 6-inch thick) over the pipeline that will act as a physical barrier to impede access to the pipe along with yellow warning tape above the concrete slab and another yellow warning tape 1 foot above the pipe; (c) burying the pipeline deeper, including a minimum depth of 4 feet from the top of the pipeline (and an additional foot deeper when crossing Broadway, a major local street adjacent to IPEC); and (d) providing thicker external corrosion protection and internal coating. In addition, construction of the AIM Project in the vicinity of IPEC will not require blasting for rock removal in the region of the AIM Project IPEC-Related Safety Enhancements; Algonquin will ensure that traffic flow is maintained during construction and that access to IPEC will not be impeded; a Direct Current Voltage Gradient survey will be performed to ensure coating integrity following enhanced pipe installation and partial backfill; and 100% of all field welds of enhanced pipeline will be subject to Non-Destructive Examination radiography. The AIM Project IPEC-Related Safety Enhancements are in addition to Algonquin's agreement to implement and abide by its Standard Operating Procedures ("SOP") applicable to the AIM Project.

Consistent with applicable NRC regulations and guidance and based on the final proposed routing, existing pipeline safety procedures and the additional design and installation enhancements that Algonquin has committed to, Entergy prepared a 10 C.F.R. § 50.59 Safety Evaluation related to the proposed AIM Project. Entergy also prepared two supporting evaluations: (1) Consequences of a Postulated Fire and Explosion Following the Release of Natural Gas from the Proposed New AIM 42" Pipeline Taking a Southern Route Near IPEC and an Analysis of the Causes, and (2) Determination of Exposure Rates Associated with a Failure of the Proposed AIM 42" Natural Gas Pipeline Near IPEC (collectively referred to as the "Hazards Analyses"). Both supporting Hazard Analyses were prepared for Entergy by the same consultant

that prepared the hazards analysis for the existing pipelines near IPEC. Entergy submitted the 10 C.F.R. § 50.59 Safety Evaluation and Hazards Analyses to the NRC on August 21, 2014.<sup>13</sup>

As documented in the attached and publicly available 10 C.F.R. § 50.59 Safety Evaluation, Entergy has concluded that based on the proposed routing of the 42-inch pipeline further from safety related equipment at IPEC, and taking into account the substantial AIM Project IPEC-Related Safety Enhancements agreed to by Algonquin, the proposed AIM Project Southern Route poses no increased risks to IPEC and there is no significant reduction in the margin of safety. As documented in the 10 C.F.R. § 50.59 Safety Evaluation and supporting Hazards Analyses, Entergy has concluded that the change in the licensing basis external hazards analysis associated with the proposed AIM Project Southern Route does not require prior NRC approval. Accordingly, and based upon those analytical and regulatory assumptions, Entergy does not oppose FERC approval of the AIM Project with the selected Southern Route, assuming implementation of the AIM Project IPEC-Related Safety Enhancements.

As noted above, however, NRC has the right to review and challenge any analysis done pursuant to 10 C.F.R. § 50.59. Specifically, NRC may request additional information on the project and potential impacts on IPEC, disagree with Entergy's conclusions regarding such impacts, or require further mitigation measures. If that occurs, NRC's questions or concerns would, as a legal requirement, have to be addressed prior to construction of the AIM Project in the vicinity of IPEC. As part of that process, NRC conducted a preliminary inspection of the AIM Project 10 C.F.R. § 50.59 Safety Evaluation at IPEC during the week of September 22, 2014. NRC has not yet identified any concerns, but its review is ongoing. NRC also plans to conduct a further technical review of the supporting Hazards Analyses this fall. Entergy expects

---

<sup>13</sup> The Safety Evaluation can be found at <http://pbadupws.nrc.gov/docs/ML1425/ML14253A339.pdf>. The supporting Hazards Analyses have been withheld from public disclosure as Security-Related Information pursuant to 10 C.F.R. 2.390.

the results of NRC's inspection and review to be available prior to the publication of the Final EIS for the AIM Project, currently scheduled for December 19, 2014. Entergy strongly advocates that prior to acting on Algonquin's Certificate Application for the AIM Project, FERC must confer with the NRC regarding the results of NRC's review of Entergy's 10 C.F.R. § 50.59 Safety Evaluation and supporting Hazards Analyses in order to become fully informed as to whether any additional mitigation is determined by NRC to be necessary for the segment of piping routed near IPEC.<sup>14</sup> If such additional mitigation is determined to be necessary to maintain the safety of IPEC, FERC should condition its grant of a certificate for the AIM Project on satisfactory implementation of such mitigation measures developed in consultation with Entergy and Algonquin.

In addition, Entergy strongly endorses the Hazard Mitigation Measures identified in the Draft EIS and urges FERC to adopt them in the final AIM Project EIS.

#### **B. Evaluation of the Alternate Northern Route**

Given Algonquin's selection of the Southern Route as the final selected pipe routing for the AIM Project, Entergy has not conducted a detailed analysis of the potential impacts of the Northern Route alternative, or other alternatives that may locate the new 42-inch line closer to IPEC. The Northern Route's addition of high-volume/high-pressure pipeline capacity closer to IPEC would require substantial additional safety analysis and, based on currently available information, could reduce the margin of safety thus requiring advance NRC review and approval. Therefore, at this time and based on selection of the 10 C.F.R. § 50.59-reviewed Southern Route,

---

<sup>14</sup> A memorandum of agreement ("MOA") between the NRC and FERC was executed in 2009. In accordance with the MOA, the two agencies may consult with each other with regard to the availability of technical information that would be useful in areas of mutual interest. Entergy understands that NRC has contacted and informed FERC of NRC's involvement as a regulatory agency for IPEC.

888 First Street NE, Room 1A  
Washington, DC 20426

**Re: Comments on Algonquin Incremental Market Project Draft Environmental Impact Statement, Docket No. CP 14-96-000**

Dear Secretary Bose:

Riverkeeper, Inc. (Riverkeeper) submits the following comments on the Draft Environmental Impact Statement (DEIS) for the Algonquin Incremental Market Project (AIM Project or Proposed Project), Docket No. CP 14-96-000. The DEIS was made available via notice of the Federal Energy Regulatory Commission (FERC or Commission) dated August 6, 2014.

Riverkeeper is a member-supported watchdog organization dedicated to defending the Hudson River and its tributaries and protecting the drinking water supply of nine million New York City and Hudson Valley residents. Riverkeeper is actively involved in public education, advocacy, and litigation surrounding the issue of shale gas extraction and related infrastructure, particularly because of the potential impacts on New York State's drinking water supplies.

For the reasons set forth below, the DEIS fails to comply with the requirements of the National Environmental Policy Act (NEPA), 42 U.S.C. §§ 4231 et seq., in several significant respects, and must be revised and reissued for public review and comment. These deficiencies include: 1) incomplete information; 2) inadequate evaluation of impacts to water resources; 3) failure to include consideration of the Atlantic Bridge Project, which impermissibly segments environmental review; and 4) failure to provide a comprehensive analysis of cumulative impacts. Further, a number of additional mitigation measures related to water resources, as well as public disclosure of all construction and post-construction information related to the AIM Project, should be evaluated and included in a revised DEIS.

**I. Background**

The AIM Project spans four states and involves the replacement and expansion of approximately 37 miles of the existing Algonquin pipeline system, the upgrade of multiple

compressor stations, and the upgrade of existing and construction of new metering and regulating stations along the pipeline route. In New York, the project involves the take up and relay of more than 13 miles of pipeline, replacing the existing 26 inch pipe with a 42 inch pipe, approximately 2 miles of new pipeline, and a new Hudson River crossing. The New York portion of the AIM Project also includes the upgrade of 2 compressor stations and 2 metering and regulating stations. In all, the Proposed Project involves 39 waterbody crossings, 77 wetland crossings, and disturbance of approximately 24 acres of wetlands in New York.

The majority of the New York portion of the Proposed Project is located within the Hudson River watershed, while approximately 2 miles of pipeline replacement and the expansion of the Southeast Compressor Station are located within the New York City (NYC) drinking water supply watershed, which provides drinking water for 9 million New Yorkers. Specifically, portions of the AIM Project are located within the sensitive Croton watershed, part of the East of Hudson NYC watershed, where drinking water supply reservoirs are already impaired for phosphorus and must be carefully protected in order to avoid further degradation.<sup>1</sup>

Algonquin Gas Transmission, LLC (Algonquin or Applicant) submitted an application to FERC for a Certificate of Public Convenience and Necessity on February 28, 2014, following a pre-application and scoping process. Riverkeeper submitted comments regarding the scope of the DEIS on October 15, 2013<sup>2</sup> and on the application for a Certificate of Public Convenience and Necessity on April 8, 2014.<sup>3</sup> In those comments, Riverkeeper identified a number of issues of concern regarding water quality and urged FERC to take a hard look, as required by NEPA, at the Proposed Project's likely impacts on both the Hudson River and NYC watersheds, as well as potential cumulative impacts.

## **II. The DEIS Fails to Provide the “Hard Look” at Environmental Impacts Required by NEPA.**

Pursuant to NEPA, federal agencies must take environmental considerations into account in their decision-making “to the fullest extent possible.” 42 U.S.C. § 4332. Prior to approving any “major federal action significantly affecting the quality of the human environment,” federal agencies must comprehensively evaluate environmental impacts, including adverse environmental effects and the means of preventing them, in a “detailed statement.” *Id.* § 4332(2)(C). NEPA requires federal agencies to “take a ‘hard look’ at environmental consequences” and “provide for broad dissemination of relevant environmental information.”

---

<sup>1</sup>The Proposed Project sites in the New York City (NYC) watershed drain to the New Croton Reservoir and the East Branch Reservoir, both of which are subject to a Total Maximum Daily Load for phosphorous. See New York State Department of Environmental Conservation (NYSDEC), Phase II Phosphorous Total Maximum Daily Loads for Reservoirs in the New York City Water Supply Watershed (2000), available at: [http://www.dec.ny.gov/docs/water\\_pdf/nycjune2000.pdf](http://www.dec.ny.gov/docs/water_pdf/nycjune2000.pdf).

<sup>2</sup> Riverkeeper Comments Regarding Scope of the Environmental Impact Statement for the Algonquin Incremental Market Project, Docket No. PF 13-16-000 (filed Oct. 15, 2013) (Scope Comments), incorporated fully by reference herein.

<sup>3</sup> Riverkeeper Comments on Abbreviated Application of Algonquin Gas Transmission, LLC for Certificate of Public Convenience and Necessity, Docket No. CP 14-96-000 (filed Apr. 8, 2014) (Application Comments), incorporated fully by reference herein.

*Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 350 (1989) (internal citations omitted).

The public availability of information regarding the environmental impacts of a proposed action is central to NEPA, which requires agencies to make “high quality” information available to “public officials and citizens *before* decisions are made and *before* actions are taken.” 40 C.F.R. § 1500.1(b) (emphases added). Accordingly, “public scrutiny [is] essential to implementing NEPA.” *Id.* The preparation of an environmental impact statement (EIS) serves this mandate by “provid[ing] a springboard for public comment,” as NEPA “guarantees that the relevant information [concerning environmental impacts] will be made available to the larger audience that may also play a role in the decisionmaking process and the implementation of the decision.” *Robertson*, 490 U.S. at 349. The opportunity for public participation guaranteed by NEPA ensures that agencies will not take final action until after their analysis of the environmental impacts of their proposed action has been subject to public scrutiny. In situations where “data is not available during the EIS process and is not available to the public for comment ... the EIS process cannot serve its larger informational role, and the public is deprived of their opportunity to play a role in the decision-making process.” *N. Plains Res. Council v. Surface Transp. Bd.*, 668 F.3d 1067, 1085 (9th Cir. 2011).

In addition, an EIS must fully disclose and evaluate the complete range of environmental consequences of a proposed action, including “ecological (such as the effects on natural resources and on the components, structures, and functioning of affected ecosystems), aesthetic, historic, [and] cultural” impacts, “whether direct, indirect, or cumulative.” 40 C.F.R. §§ 1502.16(a), (b); 1508.8. As an “environmental full disclosure law,” *Monroe Cnty. Conservation Council, Inc. v. Volpe*, 472 F.2d 693, 697 (2d Cir. 1972), NEPA “ensures that an agency will not act on incomplete information, at least in part, by ensuring that the public will be able to analyze and comment on an action’s environmental implications.” *Ohio Valley Envtl. Coal. v. U.S. Army Corps of Eng’rs*, 674 F. Supp. 2d 783, 792 (S.D. W. Va. 2009) (internal quotation marks and citations omitted).

If a DEIS “is so inadequate as to preclude meaningful analysis, the agency shall prepare and circulate a revised draft.” 40 C.F.R. § 1502.9(a). As discussed below, the DEIS falls far short of the standards prescribed by NEPA such that it precludes meaningful analysis of the environmental impacts of the Proposed Project, and must be revised and reissued for public review and comment.

#### **A. The DEIS is Incomplete.**

In Section 5.2 of the DEIS, Staff’s Recommended Mitigation, and throughout the DEIS, FERC identifies dozens of pieces of missing information and asks the Applicant to submit various documents either prior to the end of the comment period on the DEIS or prior to construction. The list of missing information includes, but is not limited to:

- ➔ Site-specific crossing plan for the Catskill Aqueduct.<sup>4</sup> (Recommended Mitigation #14; DEIS Section 4.3.2.1)

---

<sup>4</sup> Draft Environmental Impact Statement for the Algonquin Incremental Market Project (Aug. 2014) (DEIS) at 5-21.

- ➔ Additional details regarding minimization of trench dewatering in New York.<sup>5</sup> (Recommended Mitigation #16; DEIS Section 4.3.2.6)
- ➔ Revised site-specific crossing plans incorporating additional avoidance or mitigation measures for two vernal pools in New York.<sup>6</sup> (Recommended Mitigation #17; DEIS Section 4.4.3.2)
- ➔ Site-specific information regarding the location of wetlands the Applicant believes would meet criterion for non-saturated conditions at the time of construction.<sup>7</sup> (Recommended Mitigation #18; DEIS Section 4.4.4)
- ➔ Final Compensatory Wetland Mitigation Plan.<sup>8</sup> (Recommended Mitigation #19; DEIS Section 4.4.5)
- ➔ Documentation that the Hudson River crossing is consistent with New York coastal policies.<sup>9</sup> (Recommended Mitigation #28; DEIS Section 4.8.4.1)
- ➔ Final AC/DC interference study for the West Point Transmission Project and any additional mitigation to address safety related concerns.<sup>10</sup> (Recommended Mitigation #41; DEIS Section 4.12.3)
- ➔ Final conclusions regarding potential safety-related conflicts with Indian Point Energy Center following completion of a Hazards Analysis by Entergy and, if additional mitigation is required, a site-specific construction and mitigation plan.<sup>11</sup> (Recommended Mitigation #42; DEIS Section 4.12.3)
- ➔ Site-specific plan for Harriman State Park, including additional avoidance or mitigation measures.<sup>12</sup> (DEIS Section 4.6.1.5)

Riverkeeper agrees with FERC that the information identified above and in Section 5.2 of the DEIS is necessary in order to determine the Proposed Project's environmental impacts and that it must be submitted by the Applicant as soon as possible. It must also be included in a revised DEIS so that it may be reviewed and evaluated by the public and other interested agencies and government bodies. FERC may not base its decision regarding environmental impacts from the Proposed Project on an incomplete environmental impact statement, nor may it circumvent the public review process by relying on an incomplete DEIS. In order to comply with NEPA, all information identified by FERC as missing from the DEIS must be prepared and

<sup>5</sup> *Id.*

<sup>6</sup> *Id.*

<sup>7</sup> *Id.*

<sup>8</sup> *Id.*

<sup>9</sup> *Id.* at 5-22.

<sup>10</sup> *Id.* at 5-25.

<sup>11</sup> *Id.*

<sup>12</sup> *Id.* at 4-90.

submitted as soon as possible, and included and evaluated in a revised DEIS that is subsequently made available for public review and comment.

## **B. The Analysis of Impacts to Water Resources is Inadequate.**

Several issues related to potential impacts on water resources are either inadequately evaluated in or completely missing from the DEIS. As with the missing pieces of information identified by FERC, discussed in section II.A, above, these must also be addressed in a revised DEIS.

### ***1. The DEIS fails to address impacts and mitigation measures related to wetland buffers.***

The applicant proposes to mitigate unavoidable, construction-related impacts to wetlands by implementing specific wetland protection and restoration measures listed in the DEIS.<sup>13</sup> However, there is no direct consideration of wetland buffers and the only indirect consideration is the proposal to locate additional temporary workspace (ATWS) “at least 50 feet from wetland boundaries except where site-specific conditions warrant otherwise and FERC approval has been obtained...”<sup>14</sup>

The preservation and maintenance of buffer areas is critical to the protection of wetlands from construction activities and post-development stormwater runoff. Vegetated wetland buffers provide transitional areas that intercept stormwater from upland habitat before it reaches wetlands or other aquatic habitat. Buffers therefore maintain or improve water quality by trapping and removing various nonpoint source pollutants. Other water quality benefits of buffer zones include reducing thermal impacts (providing shade), nutrient uptake, infiltration, reducing erosion, and restoring and maintaining the chemical, physical and biological integrity of water resources. One hundred feet is considered the minimum buffer width recommended for water quality protection.<sup>15</sup>

Construction-related activities, including the establishment of ATWS, within 50 feet of wetlands not only pose threats to water quality but are subject to regulation at the state and local level, highlighting the importance of protecting buffer areas. The New York State Department of Environmental Conservation (NYSDEC) regulates activities within 100 feet of state wetlands.<sup>16</sup> In the New York City Watershed, the Towns of Cortlandt<sup>17</sup> and Yorktown<sup>18</sup> also regulate activities within 100 feet of local wetlands, as does the New York City Department of Environmental Protection (NYCDEP).<sup>19</sup> Nevertheless, the DEIS proposes construction activities within 50 feet of regulated wetlands and plans to request FERC approval for encroachment to

---

<sup>13</sup> *Id.* at 4-61.

<sup>14</sup> *Id.*

<sup>15</sup> SCHUELER, T., *SITE PLANNING FOR URBAN STREAM PROTECTION*, Metropolitan Washington Council of Governments (1995), 111.

<sup>16</sup> See N.Y. E.C.L. § 24-0701(2).

<sup>17</sup> See Town of Cortlandt Town Code, Chapter 179, Freshwater Wetlands, Water Bodies, and Watercourses.

<sup>18</sup> See Town of Yorktown Town Code, Chapter 178, Freshwater Wetlands.

<sup>19</sup> See *e.g.*, Rules of the City of New York, Title 15, Chapter 18 § 18-39.

less than 50 feet for 23 existing wetlands within the project right of way (ROW).<sup>20</sup> Eleven of the proposed additional encroachments abut the wetland itself. While the DEIS claims these additional encroachments are necessary to create extra workspace for saturated soils and spoil storage, there is no analysis of the potential impacts to buffers or their associated wetlands due to the proposed wide-scale and intrusive disturbance from these construction activities.

Nor is there any mitigation proposed for impacts to wetland buffers. Although the DEIS proposes compensatory mitigation for wetland disturbances at a 2:1 ratio, it fails to demonstrate that the proposed ratio will result in the successful establishment of even a 1:1 ratio of wetlands when their buffers have been disturbed to within 0-50 feet of their delineated boundaries. As discussed earlier, buffers insulate wetlands from nutrient loading and other impacts, so impairing those functions will also impair the ability of the disturbed wetland to be restored.

For the above reasons, the DEIS must include an analysis of the impacts of proposed wetland buffer disturbances from construction activities, and must further propose mitigation measures for impacts. At a minimum, the applicant should restore disturbed wetland buffer areas to their natural grade and configuration, plant them with native vegetation, and monitor them for the successful establishment of plant communities. Unless the applicant can demonstrate that impacts to buffers can be avoided, minimized or adequately mitigated, FERC, NYSDEC and local municipalities should deny any requests for variances allowing further encroachment on and adverse impacts to wetland buffers, and require that the Proposed Project be revised to comply with state and local regulations regarding disturbance within 100 feet of regulated wetlands.

## ***2. The DEIS fails to evaluate potential significant impacts from stormwater runoff.***

The DEIS fails to include a meaningful evaluation of the impacts from increased stormwater runoff due to construction activities and long-term changes in surface drainage patterns caused by the Proposed Project. Rather, the DEIS merely mentions stormwater plans and management in passing, and, for the New York portions of the Proposed Project, references a Stormwater Pollution Prevention Plan (SWPPP) that has not been included in the DEIS.<sup>21</sup>

When construction activities remove vegetation and expose soils, forest canopies no longer intercept stormwater and root systems no longer hold soils in place. Stormwater runoff from construction sites may carry pollutants – such as debris, oil and other contaminants from equipment, and any herbicides used for vegetation clearing or ROW maintenance – from the project site to downstream wetlands, streams, and other waterbodies.<sup>22</sup> Construction site runoff

---

<sup>20</sup> DEIS at 4-67—68.

<sup>21</sup> Riverkeeper notes that on September 2, 2104 we received a copy of the Stormwater Pollution Prevention Plan (SWPPP) for the New York portions of the project from the Applicant, who requested feedback by October 1, 2014. We are currently reviewing the SWPPP and will provide comments under separate cover. However, this does not remedy FERC's failure to evaluate stormwater impacts, including providing a copy of the SWPPP, in the DEIS.

<sup>22</sup> U.S. Environmental Protection Agency (EPA), Stormwater Discharges from Construction Activities, available at: <http://cfpub.epa.gov/npdes/stormwater/const.cfm>.

can also erode exposed soils and transport sediment to receiving waters.<sup>23</sup> Suspended sediment in aquatic systems degrades aquatic wildlife habitat, reduces species diversity and damages commercial and recreational fisheries.

In addition, nutrients and toxic materials, including pesticides, industrial wastes, and metals, can bind to silt and clay particles that runoff transports to waterbodies. Sediment particles also shield pathogenic microorganisms such as *Giardia* and *Cryptosporidium* from detection, which can result in waterborne disease outbreaks. Long-term changes in hydrology and surface drainage patterns may also result from construction activities, particularly in areas, such as steep slopes, where changes in ground cover and topography can increase stormwater runoff, reduce the ability of natural systems to filter pollutants, and permanently alter drainage patterns.<sup>24</sup>

Consideration of impacts from stormwater runoff is important throughout the project, particularly so within the NYC watershed. As noted above, the NYC watershed provides drinking water to 9 million New Yorkers daily, and the Proposed Project is located within a sensitive portion of the East of Hudson NYC watershed that is already impaired and subject to enhanced water quality protection criteria. Riverkeeper raised the importance of evaluating stormwater impacts from the Proposed Project and requested inclusion of the SWPPP in the DEIS in previous comments to FERC on the scope of the DEIS and on the project application.<sup>25</sup> In a letter to the Applicant dated April 10, 2014, FERC also requested that the Applicant provide a copy of the SWPPP in preparation for the DEIS;<sup>26</sup> however, none has been included.

In order to protect against water quality degradation that may potentially result from stormwater runoff, FERC must include a full analysis of potential stormwater impacts, including a complete SWPPP, in a revised DEIS. This analysis must include a description of how the pipeline construction schedule will be phased to coordinate with control measures contained in the SWPPP, as well as a consideration of alternative construction practices that can be used to avoid or reverse soil compaction and thereby prevent runoff volume.

### ***3. The DEIS must include a detailed evaluation of likely impacts and mitigation measures for the 2 vernal pools located within the Hudson River watershed.***

The DEIS lists 2 vernal pools in New York, located within the Hudson River watershed in the Town of Cortlandt, that will be directly affected by construction of the Proposed Project.<sup>27</sup> In all, construction will directly impact nearly 2,000 square feet of vernal pool habitat. While the DEIS notes that, in general, vernal pools “provide habitat for many species” and that rare species are known to use vernal pools in the project area, there is no discussion or evaluation of the

<sup>23</sup> EPA, Construction Site Management Measure III. Construction Activities (last visited Sep. 29, 2014), available at: <http://water.epa.gov/polwaste/nps/czara/ch4-3a.cfm>.

<sup>24</sup> NYSDEC, New York Standards and Specifications for Erosion and Sediment Controls (Aug. 2005) at 1.3, available at: [www.dec.ny.gov/docs/water\\_pdf/bluebook.pdf](http://www.dec.ny.gov/docs/water_pdf/bluebook.pdf).

<sup>25</sup> Scope Comments at 4-5; Application Comments at 2-3.

<sup>26</sup> Federal Energy Regulatory Commission, Letter to Mr. Berk Donaldson, Director, Rates and Certificates NE, Spectra Energy Corporation, Re Environmental Data Request – Part 1 (Apr. 10, 2014).

<sup>27</sup> DEIS at 4-63, Table 4.4.3-2.

potential impacts upon the 2 vernal pools that would be directly affected by construction. In fact, as noted above in section II.A, the DEIS is missing final, site-specific crossing plans and avoidance and/or mitigation measures for these 2 vernal pools, which FERC has requested from the Applicant.

All information regarding site-specific crossing plans and avoidance and/or mitigation measures must be submitted by the Applicant as soon as possible and included in the DEIS. In addition, the DEIS must include a comprehensive, site-specific evaluation of the potential impacts to these 2 vernal pools. This must include a bioassay survey to determine the specific kinds of wildlife supported by each vernal pool, as well as discussion of restricted construction windows for pools that are assumed to support amphibians in the spring and fall. Without this information, FERC cannot assess the potentially significant impacts to these sensitive resources.

#### ***4. The DEIS must evaluate potential impacts to the Ramapo River Basin Aquifer System.***

The Proposed Project would cross approximately 0.6 mile of the Ramapo River Basin Aquifer System, a U.S. Environmental Protection Agency (EPA) designated sole source aquifer that serves as the water source for more than 300,000 people in New York and New Jersey.<sup>28</sup> Even though EPA notes that the aquifer is “vulnerable to contamination from many sources” and that the “potential exists for incidents of surface water contamination to affect public supply wells,”<sup>29</sup> the DEIS includes no meaningful analysis of the AIM Project’s effect on this important resource. Rather, the Ramapo Basin Aquifer is only briefly mentioned before the DEIS concludes, without any real analysis, that the Proposed Project will not significantly impact groundwater resources.

The DEIS’s generic discussion of impacts to groundwater water resources is insufficient. In order to ensure protection of a resource that serves as the sole source of drinking water for hundreds of thousands of people, the DEIS must include an assessment of the specific threats to the Ramapo River Basin Aquifer System and of measures to avoid, minimize, or mitigate those threats. This assessment must include alternatives to construction in the Ramapo Basin Aquifer.

#### **C. FERC Has Impermissibly Segmented Environmental Review by Failing to Include an Evaluation of Algonquin’s Atlantic Bridge Project in the DEIS.**

The DEIS must include an evaluation of the Atlantic Bridge Project, which will upgrade and expand additional segments of the Algonquin pipeline system. As with the Proposed Project, the Atlantic Bridge Project will be implemented by the Applicant and involves expansion of the Algonquin pipeline system in portions of New York, Connecticut, Rhode Island, and Massachusetts, with a projected in service date of November 2017. In New York, the Atlantic Bridge Project would cross approximately 4 miles of the East of Hudson NYC watershed, taking up the existing 26 inch pipe and replacing it with a 42 inch pipe, and involve

<sup>28</sup> EPA, Ramapo Aquifer Systems (Aug. 1992), available at: <http://www.epa.gov/region2/water/aquifer/ramapo/ramapo.htm>. Note that EPA’s count of population served by the Ramapo River Basin Aquifer Systems is likely highly underestimated, as the document dates to 1992.

<sup>29</sup> *Id.*

an additional upgrade of the Southeast Compressor Station, which is also located within the NYC watershed. Algonquin has completed an open season<sup>30</sup> for the project, and “plan[s] to move forward.”<sup>31</sup>

Pursuant to the regulations implementing NEPA, an EIS must include: 1) connected actions, including those that are “interdependent parts of a larger action and depend on the larger action for their justification;” 2) cumulative actions, “which when viewed with other proposed actions have cumulatively significant impacts;” and 3) similar actions, “which when viewed with other reasonably foreseeable or proposed agency actions, have similarities that provide a basis for evaluating their environmental consequences together.” 40 C.F.R. § 1508.25(a). Accordingly, “[a]n agency impermissibly ‘segments’ NEPA review when it divides connected, cumulative, or similar federal actions into separate projects and thereby fails to address the true scope and impact of the activities that should be under consideration.” *Delaware Riverkeeper Network, et al. v. Federal Energy Regulatory Commission*, 753 F.3d 1304, 1313 (D.C. Cir. 2014).

In *Delaware Riverkeeper Network*, the Court found that FERC violated NEPA when it segmented environmental review of four separate proposals by Tennessee Gas Pipeline Company to upgrade different sections of the Eastern Leg of its 300 Line. Finding that the four projects were “certainly ‘connected actions,’” the Court explained:

“There is a clear physical, functional, and temporal nexus between the projects. There are no offshoots to the Eastern Leg. The new pipeline is linear and physically interdependent; gas enters the system at one end, and passes through each of the new pipeline sections and improved compressor stations on its way to extraction points beyond the Eastern Leg. The upgrade projects were completed in the same general time frame, and FERC was aware of the interconnectedness of the projects ... [t]he end result is a new pipeline that functions as a unified whole thanks to the four interdependent upgrades.”

752 F.3d at 1308-1309. The Court went on to dismiss claims that there were logical termini between any of the new upgrade segments or that any possessed substantial independent utility apart from the others, finding that the projects were “inextricably intertwined” as part of the same linear pipeline. *Id.* at 1315-1317.

The Atlantic Bridge Project falls into all three categories of actions that must be evaluated in a DEIS pursuant to 40 C.F.R. § 1508.25(a). First, the Proposed Project and the Atlantic Bridge Project are clearly connected actions, as both are interdependent parts of a larger action: the upgrade of the Algonquin pipeline system. Both projects involve upgrade and

<sup>30</sup> The Applicant held an open season to gauge market interest in the Atlantic Bridge Project earlier this year. See Spectra, Atlantic Bridge Project: Open Season Notice for Firm Service February 5, 2014 – March 31, 2014 (last visited Sep. 28, 2014), available at: <https://infopost.spectraenergy.com/GotoLINK/GetLINKdocument.asp?Pipe=10076&Environment=Production&DocumentType=Notice&FileName=Atlantic+Bridge+Project+Open+Season.pdf&DocumentId=8a7842c943fed9190143ff70248c0028>.

<sup>31</sup> Spectra, New Projects and Our Process: Atlantic Bridge Project (last visited Sep. 25, 2014), available at: <http://www.spectraenergy.com/Operations/New-Projects-and-Our-Process/New-Projects-in-US/Atlantic-Bridge>.

expansion of different segments of the Algonquin pipeline system, with several sections of both projects involving the take up of existing 26 inch pipe and replacing it with larger 42 inch pipe. The pipeline is linear, running in a line from New Jersey through New York, Connecticut, Rhode Island, and Massachusetts before branching. Further, the finished projects will function as a unified whole, as they involve replacing and expanding sections of the same linear pipeline system. The projects are also closely connected in time, as the Atlantic Bridge Project's projected in service date is only one year later than the AIM Project and there will be overlaps in construction.

Second, as discussed in section II.D below, the AIM and Atlantic Bridge Project are cumulative actions, as each would affect many of the same resources in the same area, including the NYC watershed, and the combined, incremental effect of each has the potential to be cumulatively significant. Finally, there is no question that the projects are similar actions, and that the Atlantic Bridge Project is a reasonably foreseeable action under NEPA. The Atlantic Bridge Project shares many similarities with the AIM project, as discussed above, and will be constructed within a similar timeframe.

Moreover, although the Applicant has not yet, to our knowledge, submitted an application to FERC for the Atlantic Bridge Project, the project has been announced and is moving forward. Algonquin has executed an agreement with Unitil, a natural gas distribution company, and has completed an open season for the project.<sup>32</sup> The company has also scheduled informational meetings to review the project with members of the public. One such meeting is in fact scheduled in Yorktown Heights, New York on September 29, 2014,<sup>33</sup> the day that the public comment period on the AIM Project DEIS closes.

In addition, the portion of the Atlantic Bridge Project located in New York appears to overlap with an earlier version of the AIM Project that was proposed in the Applicant's initial draft Environmental Report in July 2013. According to a map submitted with the Applicant's July 2013 draft Environmental Report, attached as Appendix A, the AIM Project was initially proposed within a much larger section of the NYC watershed, spanning from Cortlandt, New York to Somers, New York. The AIM Project was later modified to the current proposal, wherein the portion of the project in the NYC watershed was shortened to an approximately 2 mile segment from Cortlandt, New York to Yorktown, NY. The Atlantic Bridge Project would include a 4 mile segment in the NYC watershed, beginning in Yorktown, NY and appearing to run northeast toward Somers, New York. See map attached as Appendix B. Therefore, it appears that at least the New York portion of the Atlantic Bridge Project was proposed as a part of the AIM Project, then later broken into a separate project.

Given the interconnectedness of the Proposed Project and the Atlantic Bridge Project – which would upgrade and expand the same pipeline system, in the same area, affecting many of

---

<sup>32</sup> *Id.*

<sup>33</sup> Town of Yorktown, New York, Algonquin Gas Transmission Will Hold Informational Meeting for Atlantic Bridge Expansion Project (last visited Sep. 25, 2014), available at: <http://www.yorktownny.org/community/algonquin-gas-transmission-will-hold-informational-meeting-atlantic-bridge-expansion>.

the same resources, over the same general time period – the DEIS must include a review and analysis of both projects.

#### **D. The DEIS Fails to Provide a Comprehensive Analysis of Cumulative Impacts.**

The cumulative impacts analysis in the DEIS is woefully inadequate and fails to evaluate a number of “past, present, and reasonably foreseeable future actions” that are likely to combine with the effects of the Proposed Project to create cumulative impacts on water resources, climate change, and other aspects of the environment. The cumulative impacts analysis must be revised to comply with the requirements of NEPA.

Under NEPA, an EIS must include an evaluation of cumulative impacts,<sup>34</sup> defined as:

“[T]he impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.”

40 C.F.R. § 1508.7. *See also Oregon Natural Res. Council Fund v. Brong*, 492 F.3d 1120, 1132–33 (9th Cir. 2007) (“One of the specific requirements under NEPA is that an agency must consider the effects of the proposed action in the context of all relevant circumstances, such that where several actions have a cumulative . . . environmental effect, this consequence must be considered in an EIS.”) (internal quotation marks and citations omitted). Assessing the impacts of a proposed action within the context of existing and foreseeable effects in the same area yields “a realistic evaluation of the total impacts” and ensures that an EIS does not impermissibly “isolate a proposed project, viewing it in a vacuum.” *Grand Canyon Trust v. Fed. Aviation Admin.*, 290 F.3d 339, 342 (D.C. Cir. 2002).

First, the DEIS must include an analysis of cumulative impacts from the Atlantic Bridge Project, discussed in section II.C above. The Atlantic Bridge project is being constructed in the same area of the Proposed Project, during the same general timeframe, and would affect many of the same resources, including the East of Hudson NYC watershed. It is also being undertaken by the Applicant, meaning that details regarding project plans and likely impacts should be readily available to FERC upon request.

The DEIS does include a brief mention of the Atlantic Bridge Project, before concluding that “[b]ecause the Atlantic Bridge Project would not occur at the same time as the AIM Project, and because details are not known, it is not considered further in this analysis.”<sup>35</sup> This is not sufficient to satisfy NEPA’s requirements. The projects will be constructed during similar timeframes, with the AIM Project scheduled for construction in 2015 and the Atlantic Bridge Project scheduled for construction in 2015 and 2016.<sup>36</sup> In addition to the overlap in 2015, the

<sup>34</sup> NEPA requires an analysis of “direct effects” and “indirect effects.” 40 C.F.R. § 1502.16(a),(b). The term “effects” includes those that are “direct, indirect, or cumulative.” *Id.* § 1508.8.

<sup>35</sup> DEIS at 4-272.

<sup>36</sup> *Id.*

timeframe for construction of the Atlantic Bridge Project is well within the timeframe of long-term, and even many short-term, impacts from the AIM Project.

Given that the projects will impact many of the same resources, using presumably many of the same construction methods by the same company, it is difficult to believe that FERC is unable to evaluate the expected environmental impacts from the Atlantic Bridge Project, as they should be remarkably similar to those of the AIM Project. For example, the Atlantic Bridge Project, as the AIM Project, would be constructed within the East of Hudson NYC watershed – replacing the existing 26 inch pipe with an expanded 42 inch pipe. Both projects risk causing short and long term impacts in the NYC watershed due to increased stormwater runoff, changes in drainage patterns, and disturbance of wetlands. These similar impacts must be considered together in the DEIS in order to provide a comprehensive evaluation of the potential impacts of the Proposed Project.

Second, the DEIS must include an analysis of any cumulative impacts from residential and/or commercial development projects in the East of Hudson NYC watershed that may be constructed within the same period of time as the Proposed Project. As part of the Environmental Report submitted with its application on February 28, 2014, the Applicant noted that various development and redevelopment projects in the NYC watershed may have cumulative impacts on resources when combined with the Proposed Project.<sup>37</sup> However, even this cursory identification of watershed development projects, which falls far short of NEPA's required cumulative impacts evaluation, is not included in the DEIS. Instead, the cumulative impacts analysis contained in the DEIS completely ignores the existence of residential and/or commercial development projects within the East of Hudson NYC watershed, projects which fall squarely within the zone of cumulative impacts analysis required by NEPA. Development projects which occur in the East of Hudson NYC watershed would have similar impacts upon water and wetland resources in that area, as they often result in grading during construction, clearing of trees and other vegetation, disturbance of wetlands and buffer areas, increased stormwater runoff, and long-term changes in drainage patterns. Moreover, development projects planned for construction in the same window of time as the Proposed Project are easily identifiable by contacting watershed towns, which must approve proposed projects and will have records of environmental impacts and anticipated construction windows.

The DEIS must include identification and evaluation of each residential and/or commercial development project planned for construction in the East of Hudson NYC watershed during the same anticipated construction timeframe as the Proposed Project. The likely impacts from these projects, along with the Applicant's plans for minimizing those impacts, must be detailed in the DEIS and comprehensively evaluated for potential cumulative impacts to the NYC watershed.

Third, the DEIS must include an evaluation of the impacts associated with increased industrial gas extraction activities that will be facilitated by the AIM Project, which will considerably expand natural gas delivery capacity in the Northeast region and therefore increase demand for gas extraction. The DEIS notes and quickly dismisses any potential cumulative

---

<sup>37</sup> Algonquin Incremental Market Project, Resource Report 1: General Project Description (Feb. 2014), Table 1.14-1, at 1-65 – 1-68.

impacts from increased natural gas extraction, concluding that shale development occurs too far outside the project area to be considered further.<sup>38</sup> This ignores the potential for regional level impacts on airsheds, watersheds, and other resources from increased industrial gas development, as well as the potential climate change impacts, discussed below.

Finally, the DEIS must include substantive consideration of the Proposed Project's likely cumulative impacts on climate change. Emissions of greenhouse gases (GHGs) associated with natural gas extraction, production, processing, transport, and infrastructure will be significantly increased by the AIM Project. According to the DEIS, taken together, potential estimated emissions of carbon dioxide equivalent (CO<sub>2</sub>e) from the Proposed Project's modifications to compressor stations alone will total more than 325,000 tons per year.<sup>39</sup> In addition to emissions from operation of the pipeline and related infrastructure, there are also likely to be increases in methane emissions associated with the increased extraction of natural gas facilitated by the AIM Project. Because methane is a significantly more potent greenhouse gas than carbon dioxide<sup>40</sup> and recent studies have found that the amount of methane currently emitted into the atmosphere from the natural gas supply chain has been considerably underestimated by regulators,<sup>41</sup> increased methane emissions as a result of this project have the clear potential to be a contributor to global climate change that must also be addressed in the DEIS.

The DEIS mentions climate change only briefly, as part of the cumulative impacts analysis, before concluding that "there is no standard methodology to determine how a project's relatively small incremental contribution to GHGs would translate into physical effects on the global environment."<sup>42</sup> This statement is, in fact, incorrect. EPA and other federal agencies use the social cost of carbon protocol to estimate climate benefits of agency actions and the economic costs associated with small increases in carbon dioxide.<sup>43</sup> In fact, a federal court recently rejected an environmental review conducted by federal agencies under NEPA for failing to estimate the costs associated with increases in GHG emissions. The Court disagreed with the agencies' assertion that it was not possible to estimate the incremental effects of GHG emissions, precisely due to the availability of the social cost of carbon protocol. *High County Conservation Advocates, et al. v. United States Forest Service, et al.*, 44 E.L.R. 20144 (Dist. Colo. 2014) (finding it was "arbitrary and capricious to quantify the *benefits* ... and then explain that a similar analysis of the *costs* was impossible when such an analysis was in fact possible") (emphasis in original). Accordingly, an evaluation of the Proposed Project's cumulative impacts

<sup>43</sup> EPA, The Social Cost of Carbon (last visited Sep. 28, 2014), available at: <http://www.epa.gov/climatechange/EPAactivities/economics/scc.html>.

on climate change must be included in the DEIS to the fullest extent possible given the court acknowledged tools that are available.

### **III. The DEIS Should Include Additional Mitigation and Public Disclosure Measures.**

NEPA requires that an EIS contain a discussion of “mitigation measures” for avoiding, minimizing, rectifying, reducing, or compensating for environmental impacts. 40 C.F.R. §§ 1502.16; 1508.20. The following additional mitigation measures should be evaluated and included in the DEIS in order to minimize impacts on water resources. The DEIS should also discuss measures to ensure that information related to construction and post-construction activities is made available to the public in a timely and accessible manner.

#### ***1. The Applicant should be required to implement additional mitigation measures for the Hudson River HDD crossing.***

The Applicant plans to use horizontal directional drilling (HDD) to install a section of new, 42 inch pipeline under the Hudson River. Riverkeeper agrees with FERC’s assessment that if the use of HDD in the location identified by the Applicant is unsuccessful, the Applicant is required to obtain new authorizations for any requested change in location or crossing method.<sup>44</sup>

However, FERC should require the Applicant to include additional mitigation measures for the planned Hudson River HDD crossing. According to the discussion provided in the DEIS, “results of the preliminary hydraulic fracture evaluation suggest a relatively high potential for hydraulic fracture in the soft sediments of the Hudson River HDD alignment.”<sup>45</sup> While the Applicant has agreed to implement “proper containment structures” should an inadvertent release of drilling fluid occur, there is no discussion of preventative measures that would be taken to ensure that an inadvertent release does not occur. Given the admittedly high likelihood of an inadvertent release, as well as the very real possibility that such a release would be difficult to observe due to river traffic and existing turbidity, the Applicant should be required to implement containment structures prior to beginning drilling in the nearshore area. It is far easier and less environmentally risky to implement preventative measures to avoid a release than to attempt to contain a release that is already occurring.

The DEIS should also assess the benefits of real time monitoring of the HDD drilling operation and water quality in the vicinity of the drilling, to ensure that any loss of drilling fluid into the environment would be quickly discovered and stopped. Riverkeeper called for an evaluation of monitoring of HDD operations in our comments on the scope of the DEIS,<sup>46</sup> but it has not been included in the current draft.

---

<sup>44</sup> DEIS at 2-36.

<sup>45</sup> *Id.* at 4-45.

<sup>46</sup> Scope Comments at 2-3.

***2. The Invasive Species Control Plan should be revised to require seeding, planting, and monitoring of native wetland vegetation.***

The DEIS references the Applicant's Invasive Species Control Plan (ISCP) when describing mitigation for construction related impacts to wetlands.<sup>47</sup> The ISCP proposes to control the spread of common reed, purple loosestrife, Japanese knotweed and glossy buckthorn, which are invasive plant species that in many cases are well established and comprise over 90% of the vegetative cover.<sup>48</sup> Common reed (*Phragmites*) and purple loosestrife are in fact well-suited to wetland soils and hydrology because they are obligate hydrophytes that establish and persist in such conditions.

The ISCP, however, proposes to seed restored wetland ROWs with ryegrass, an upland species not suited for establishment in wetlands, within six days of regrading. Ryegrass is well suited to stabilize disturbed soils in upland areas, but it is unlikely to establish in wetland areas, especially where standing water exists. Instead, the ISCP should require seeding, planting and monitoring of native wetland vegetation where wetlands have been disturbed by construction activities.

***3. The DEIS should include an explicit prohibition on the use of chemical additives in hydrostatic test water.***

In our comments on Algonquin's application for a Certificate of Public Convenience and Necessity, Riverkeeper urged FERC to include a prohibition on the use of chemical additives during hydrostatic testing – which risks contaminating waterbodies and watersheds when the test water is disposed of – as a condition of project approval.<sup>49</sup> Algonquin agreed to this request within the NYC watershed in its response to our comments.<sup>50</sup> However, the DEIS merely notes that the Applicant is “not proposing to use any chemicals for testing or for drying the pipeline following hydrostatic testing.”<sup>51</sup> The DEIS should include as a recommended condition for approval a prohibition on the use of chemical additives in hydrostatic test water throughout the project, including but not limited to the portions located within the NYC watershed.

***4. The Applicant should be required to provide third-party, pre- and post-construction testing and monitoring for water supply wells within the project area.***

The DEIS lists dozens of water supply wells within 150 feet of the construction work area for the Proposed Project, some of which may be proximal to blasting. The list includes 47 water supply wells in New York. The Applicant has agreed to offer pre-and post-construction

---

<sup>47</sup> DEIS at ES-4, ES-10, 4-62.

<sup>48</sup> Algonquin Incremental Market Project, Resource Report 3: Fish, Wildlife, and Vegetation (Feb. 2014), Appendix F, *Invasive Species Control Plan*.

<sup>49</sup> Application Comments at 4.

<sup>50</sup> Motion for Leave to Answer and Answer of Algonquin Gas Transmission, LLC, Docket No. CP14-96-000 (Apr. 23, 2014) at 19.

<sup>51</sup> DEIS at 4-54.

monitoring of well yield and water quality and has been instructed to report water supply well complaints within 30 days of placing the AIM Project in service.<sup>52</sup>

While well monitoring and reporting of complaints are a good first step, Riverkeeper urges FERC to require the Applicant to conduct comprehensive, third-party pre- and post-construction well testing and ongoing monitoring of all potentially affected water supply wells. The Applicant should be required to test and monitor for a specified list of potential contaminants, which should be included in the DEIS, as well as for water yield. Finally, any reports regarding water supply well complaints and/or contamination should be made available to the public, as well as to FERC.

***5. The Applicant should be required to implement additional mitigation measures to protect fisheries resources and aquatic biota.***

Section 4.6.2.3 of the DEIS discusses impacts and mitigation measures regarding fisheries and aquatic resources that could be affected by construction of the Proposed Project. While Riverkeeper agrees with the use of the mitigation measures recommended by NYSDEC and included in the DEIS,<sup>53</sup> they alone are insufficient to protect fisheries and aquatic biota that may be negatively impacted by the 39 waterbody crossings planned in New York. In addition to the mitigation measures detailed in the DEIS, the Applicant should be required to collect baseline data regarding pre-construction waterbody and water quality conditions. This should include photo documentation of the pre-existing stream conditions, as requested by the Connecticut Department of Energy and Environmental Protection,<sup>54</sup> as well as pre-construction water quality testing. The Applicant should then be required to follow up with post-construction water quality testing in order to ensure that restoration measures have been successful, and, if they have not, with the implementation of additional measures.

***6. The Applicant should be required to publicly disclose all construction and post-construction plans, reports, and monitoring.***

Given the significant public interest in the Proposed Project, as well as the number of individuals and communities that will be affected, the Applicant should be required to disclose all construction and post-construction plans, reports, and monitoring on a publicly accessible website. To the extent that this information is already included in the Environmental Report and the DEIS, it should be relatively easily for the Applicant to include it on a dedicated website, which can then be updated with construction and post-construction information as it becomes available.

#### **IV. Conclusion**

For the reasons set forth above, the DEIS contains substantial flaws and fails to meet NEPA's mandate that FERC take a hard look at the potentially significant environmental impacts associated with the AIM Project. Accordingly, the DEIS must be revised and resubmitted for

---

<sup>52</sup> *Id.* at 4-34.

<sup>53</sup> *Id.* at 4-98 – 4-99.

<sup>54</sup> *Id.* at 4-98.

public review and comment before FERC makes any decision regarding the Applicant's request for a Certificate of Public Convenience and Necessity.

Sincerely,

Re: *Algonquin Gas Transmission, LLC*, Docket No. CP14-96-000  
Transmittal Letter for Response to DEIS

Dear Ms. Bose:

On February 28, 2014, Algonquin Gas Transmission, LLC (“Algonquin”) filed with the Federal Energy Regulatory Commission an Abbreviated Application for Certificate of Public Convenience and Necessity and for Related Authorizations for the Algonquin Incremental Market Project (“AIM Project”) in the above-referenced docket. On August 6, 2014, the Commission Staff issued its Draft Environmental Impact Statement (“DEIS”) for the Project, including requests for information as part of Staff’s mitigation recommendations (“Staff Requests”) and establishing a deadline for comments on the DEIS of September 29, 2014. On September 2, 2014, and September 19, 2014, Algonquin submitted responses to certain of the Staff Requests.

In Attachment A of this submission, Algonquin responds to each Staff Request that was not addressed in the two prior responses. Additionally, Algonquin is hereby submitting its comments on the DEIS in Attachment B hereto. Algonquin’s comments address (i) the withdrawal of the request for authorization for the proposed Yorktown contractor/pipe yard, (ii) the status of the northern long-eared bat, (iii) AIM Project air emissions, and (iv) cumulative impacts of the AIM Project and Algonquin’s Atlantic Bridge Project, which is currently under development. Algonquin is also suggesting certain clarifications to the DEIS, which are listed in tabular form in Attachment C. None of Algonquin’s responses or comments result in substantial changes in the proposed action or provide significant new circumstances or information relevant to environmental concerns.<sup>1</sup>

## **Attachment B**

## **DEIS COMMENTS**

### ***Yorktown Pipe Yard.***

Algonquin is no longer proposing to utilize a pipe and contractor ware yard at the Granite Knolls West Park in the Town of Yorktown. Accordingly, Staff should revise the DEIS to reflect that Algonquin is withdrawing its proposal to use the ware yard in the Town of Yorktown.<sup>1</sup>

### ***Northern long-eared bat.***

The northern long-eared bat is currently proposed for federal listing as an endangered species with a final rule now anticipated in April 2015.<sup>2</sup> The description of the timing of the final rule in Section 4.7.1.3 of the DEIS (page 4-111) should be revised accordingly to reflect this new anticipated date.

### ***Air Emissions.***

Algonquin has determined that certain proposed changes to the Stony Point, Chaplin and Burrillville compressor stations are no longer necessary and, as a result, is proposing scope changes to Table 2.1.2-1 as reflected in Attachment D. Given that all of the changes to these compressor stations will reduce the scope of the proposed facilities and the related impacts, these changes are not significant and do not affect the analysis or conclusions of the DEIS.

Algonquin also is proposing changes to Tables 4.11.1-7 through 4.11.1-11 to reflect updated air emissions information included in permit amendments filed with the relevant state agencies.<sup>3</sup> The proposed changes to the tables, reflected in Attachment J, are the result of the scope changes to the three compressor stations discussed above, as well as due to minor adjustments to the relevant calculations. All of these changes to the air emissions tables are *de minimis*, except for the amount of CO<sub>2</sub>e shown in the Proposed Modified Station PTE line for the Southeast Compressor Station in Table 4.11.1-8 and related amounts of greenhouse gas (“GHG”) emissions in the first full paragraph on page 4-236. The CO<sub>2</sub>e and greenhouse gas emissions reported in the DEIS differ from the emissions provided by Algonquin in a June 20, 2014 filing.<sup>4</sup> This proposed change to correct the potential CO<sub>2</sub>e for Southeast in Table 4.11.1-8 and to update the total GHG emissions, as measured in CO<sub>2</sub>e, for all modified compressor stations does not reflect

---

<sup>1</sup> References to the Yorktown yard are included in Table 2.2.3-1 (p 2-15), Section 4.2.1.3 (p. 4-19), Section 4.3.2.1 (p. 4-39), Section 4.4.1 (p. 4-56), Section 4.5.1.3 (p. 4-72), Section 4.5.4.3 (p. 4-81), Section 4.6.1.4 (p. 4-88), and Section 4.8.5.1 (p. 4-157). In addition, certain tables will need to be revised to remove the acreage associated with the yard.

<sup>2</sup> Bulletin: U.S. Fish and Wildlife Service Reopens Comment Period on Proposal to List the Northern Long-eared Bat as an Endangered Species (June 30, 2014), available at <http://www.fws.gov/midwest/news/734.html>. On June 30, 2014, FWS announced a 6-month extension of the final determination of whether to list the northern long-eared bat as endangered and reopened the comment period on the proposed rule to list the species due to substantial disagreement regarding the sufficiency or accuracy of the available data relevant to FWS’s determination regarding the proposed listing. 6-Month Extension of Final Determination on the Proposed Endangered Status for the Northern Long-Eared Bat, 79 Fed. Reg. 36,698 (June 30, 2014). FWS will publish a listing determination on or before April 2, 2015. *Id.*

<sup>3</sup> A copy of each permit amendment is included in Attachment E.

<sup>4</sup> Algonquin Gas Transmission, LLC, Supplemental Information – Air Quality Information, Docket No. CP14-96-000 (June 20, 2014) (“Supplemental Filing”).

a significant change in terms of regional GHG emissions.<sup>5</sup> The emissions information provided in the attached table for Southeast is consistent with the information that Algonquin has provided to the New York State Department of Environmental Conservation (“NYSDEC”) and which will be reflected in the modified air permit that NYSDEC will subject to public review.

### *Cumulative Impacts.*

The purpose of the AIM Project is to provide 10 New England shippers with 342,000 dekatherms per day (“Dth/d”) of additional natural gas supply to meet immediate and future load growth demands and to reduce volatility in natural gas pricing. The AIM Project is designed to enable Algonquin to provide 342,000 Dth/d of firm transportation service from Algonquin’s existing receipt point in Ramapo, New York, to various Algonquin city gate delivery points in southern New England, including Connecticut, Rhode Island and Massachusetts. The AIM Project shippers include eight local distribution companies and two municipal utilities that need the transportation capacity to provide natural gas distribution service to end users in Southern New England. State regulatory proceedings or municipal meetings for each of the AIM Project shippers addressed the need for the AIM Project to provide access to supply in order to meet market demand in Southern New England beginning in November 2016. Subject to regulatory approval, construction of the AIM Project is anticipated to occur in 2015 and 2016.

Notwithstanding the AIM Project, as the DEIS explains on page 4-272, Algonquin continues to evaluate various options to modify other parts of its existing interstate natural gas pipeline system to meet the growing market demand for increased energy in the Northeast. One such option is referred to as the Atlantic Bridge Project, which may include work in New York, Connecticut, Rhode Island, and Massachusetts in 2017. As the DEIS also notes, the “specific details about the Atlantic Bridge Project are currently not developed and no applications have been filed.” As a result, there is no “proposal” for action pending before FERC relating to the Atlantic Bridge Project. *See* 40 C.F.R. § 1508.23.

Even if the Atlantic Bridge Project develops at some future date to the point of being a “proposal” for purposes of NEPA, the AIM Project is an unconnected single action that has independent utility. *See* 40 C.F.R. § 1508.25. The AIM Project will proceed irrespective of whether Atlantic Bridge (or any other future “proposals” relating to system modifications or expansions) occurs. The AIM Project does not depend on any other actions for its justification nor automatically cause other actions to occur. Therefore, the proper scope of the EIS for the AIM Project is limited to that action, and the AIM Project is not connected to the Atlantic Bridge Project or any other system modifications.

The potential Atlantic Bridge Project is based on interest for additional natural gas supplies in New England (including New Hampshire and Maine) and the Canadian Maritime provinces. Increased demand for more natural gas supplies in the Northeast continues, due to price volatility in the cold winter months as well as state and local initiatives to convert combustion sources from coal and oil to cleaner-burning natural gas. These supplies would be

---

<sup>5</sup> The changes to these amounts reflect the amounts included in the Supplemental Filing with *de minimis* adjustments to reflect the updated amounts in the permit amendments.

outside of the 342,000 Dth/d contracted for under the AIM Project. Algonquin and its affiliate, Maritimes & Northeast Pipeline, L.L.C. (“Maritimes”), conducted a formal open season to determine market demand for additional natural gas supply that could involve additional expansions of the existing Algonquin and Maritimes systems. The open season for the Atlantic Bridge Project, which was completed in March 2014, reflected interest for additional natural gas supplies by local distribution companies, power generators and industrial customers across southern New England, northern New England and Atlantic Canada. Algonquin expects that Atlantic Bridge Project customers will include some southern New England customers, but will also include northern New England and Canadian customers delivering volumes to Maritimes at the end of the Algonquin system in Beverly, Massachusetts. Those customers are also seeking transportation service on Maritimes’ system to transport natural gas to their delivery points off Maritimes’ system or to the point of interconnection between Maritimes and Maritimes & Northeast Pipeline Limited Partnership at the Canadian border for deliveries in Canada.

As a result, Algonquin began to study the feasibility of increasing the delivery of gas supplies to these areas. Initial feasibility review involved conducting surveys along the existing pipeline right-of-way and meeting with landowners and municipal officials so that Algonquin could begin to define the scope of any such new project. At this time, Algonquin has not entered into any precedent agreements for additional natural gas transportation services with any shipper. Nonetheless, Algonquin has begun to present the possibility of a future Atlantic Bridge Project to landowners in informational sessions across New York and the New England states. Algonquin anticipates that, if such potential project does move forward and subject to regulatory approval, it will construct the Atlantic Bridge Project during 2017 and place the facilities into service in November 2017.

Notwithstanding the current lack of any “proposal” for NEPA purposes relating to a future Atlantic Bridge Project, more is known now about the Atlantic Bridge Project and its reasonably foreseeable impacts should the project move forward than was the case at the time of the issuance of the DEIS. As a result, Algonquin provides below, based on the current preliminary plans, a map-level analysis of the current reasonably foreseeable impacts of an Atlantic Bridge Project that may contribute to cumulative impacts to the same affected environments as those of the AIM Project. Algonquin notes, however, that the Atlantic Bridge Project is still preliminary and changes to the routing and design may occur.

## **Cumulative Impacts**

Cumulative impacts may result when the environmental effects associated with a proposed project are added to temporary (construction-related) or permanent (operations-related) impacts associated with other past, present, or reasonably foreseeable future projects. Although the individual impact of each separate project might not be significant, the additive or synergistic effects of multiple projects on the same affected environments could be significant. As noted, Algonquin is in the early planning stages of the Atlantic Bridge Project. Tables 1-1 and 1-2 list the anticipated pipeline facilities being contemplated for expansion under the Atlantic Bridge

Project.<sup>6</sup> Subject to regulatory approvals, construction of the Atlantic Bridge Project is currently anticipated to occur in 2017, which is after the 2015-2016 anticipated AIM Project construction period.

<b>TABLE 1.1. SUMMARY OF CURRENTLY PROPOSED ATLANTIC BRIDGE PROJECT PIPELINE FACILITIES</b>				
<b>State, Facility Name</b>	<b>Description</b>	<b>Proposed Diameter</b>	<b>County</b>	<b>Length (miles)</b>

<b>TABLE 1.2. SUMMARY OF CURRENTLY PROPOSED ATLANTIC BRIDGE PROJECT ABOVEGROUND FACILITIES</b>		
<b>State Facility Name</b>	<b>Description</b>	<b>Location (County, Municipality)</b>
<b><i>New York</i></b>		
Southeast Compressor Station	Add compression	Putnam, Southeast

<sup>6</sup> As currently proposed, only three segments of Atlantic Bridge pipeline facilities will overlap or be adjacent to AIM Project pipeline facilities.

**TABLE 1.2. SUMMARY OF CURRENTLY PROPOSED ATLANTIC BRIDGE PROJECT ABOVEGROUND FACILITIES**

<b>State Facility Name</b>	<b>Description</b>	<b>Location (County, Municipality)</b>
Stony Point Compressor Station	Add compression	Rockland, Stony Point
<i>Connecticut</i>		
Chaplin Compressor Station	Add compression and cooling	Windham, Chaplin
Cromwell Compressor Station	Add compression	Middlesex, Cromwell
Oxford Compressor Station	Add compression	New Haven, Oxford
<i>Massachusetts</i>		
Weymouth Compressor Station	New compressor station	Norfolk, Weymouth
<i>Rhode Island</i>		
Burrillville Compressor Station	Add compression	Providence, Burrillville

The following analyzes the potential for cumulative impacts resulting from construction and operation of the Atlantic Bridge Project, based on current preliminary plans, on environmental resources affected by the proposed AIM Project.

#### Geology, Soils, and Sediments

The facilities associated with the Atlantic Bridge Project are expected to have a temporary but direct impact on near-surface geology, soils, and sediments. Clearing and grading associated with construction of the Atlantic Bridge Project and the AIM Project could accelerate the soil erosion process and, without adequate protection, could result in discharge of sediment to adjacent waterbodies and wetlands. Because the direct effects would be localized and limited primarily to the period of construction, cumulative impacts on geology, soils, and sediments would only occur if other projects are constructed at the same time and place as the proposed Atlantic Bridge Project facilities. The construction schedule of the AIM Project does not coincide with the schedule anticipated for the Atlantic Bridge Project. The AIM Project would be constructed and the right-of-way restored before potential construction of the Atlantic Bridge Project. As with the AIM Project, Algonquin would implement the FERC Plan for the Atlantic Bridge Project to establish a baseline for minimizing the potential for erosion as a result of water or wind action and to aid in reestablishing vegetation after construction of each project. In addition, disturbance associated with construction activities would be minimized and mitigated through the application of best management practices (“BMPs”) that would be incorporated in the Atlantic Bridge Project Erosion and Sedimentation Control Plan (“E&SCP”). Should hazardous materials or contaminated soils and/or sediments be encountered during construction, they would be disposed of at fully licensed and permitted disposal facilities in accordance with applicable state and federal laws and regulations. As a result, any cumulative effects on geological resources, soils, and sediments from the AIM Project and Atlantic Bridge Project are expected to be temporary and minor.

### Water Resources and Wetlands

Based on current preliminary plans, construction of the Atlantic Bridge Project facilities could affect 45.9 acres of wetland and cross 77 waterbodies. The Connecticut River is expected to be crossed using the horizontal directional drill (“HDD”) method, which would avoid all direct in-stream effects; however, there is a potential for in-stream impacts should an inadvertent release of drilling mud occur during the crossing. Algonquin would prepare a Best Drilling Practices HDD Plan that describes measures that would be implemented in the event of an inadvertent release of drilling fluid similar to the plan prepared for the Hudson River HDD for the AIM Project.

Sediment loading could also occur due to runoff from construction activities near wetlands and waterbodies. These resources could also be affected by a spill of hazardous liquids or the excavation and dispersal of contaminated sediments during trenching. The AIM Project and Atlantic Bridge Project would be required by the terms and conditions of their respective Section 404 authorizations to provide compensatory mitigation for unavoidable wetland impacts. The AIM Project has also been required to minimize these effects by implementing wetland and waterbody construction and mitigation measures, including erosion control measures that comply with applicable federal and state permit requirements.

Much of the Atlantic Bridge Project is located within the watersheds crossed by the AIM Project, and could potentially result in impacts on wetlands and surface waters. Therefore, there is the potential that cumulative impacts could result if the Atlantic Bridge Project were constructed in addition to the AIM Project; however, the Atlantic Bridge Project would contribute little to the long-term cumulative impacts on wetlands and waterbodies. Impacts on surface waters resulting from project construction would end shortly after the pipelines are installed and most of the impact on wetlands would also be of short duration. It is anticipated that most of the affected wetlands would be restored and most are expected to return to a pre-construction state within a few years. Avoidance and minimization requirements would be followed, however if Atlantic Bridge Project facility construction necessitated any permanent wetland impacts, those impacts are likely to be small in area. Permanent impacts would be minimized to the extent practical and mitigation measures would be implemented as necessary pursuant to applicable regulations. The Atlantic Bridge Project would also be subject to all federal and state regulatory requirements, including wetland and waterbody construction and mitigation measures to minimize impacts to wetlands and water bodies from that project.

Both projects would also occur within the New York City Watershed and would be subject to additional requirements provided for in a stormwater pollution prevention plan (“SWPPP”). The SWPPPs must be approved by the New York City Department of Environmental Protection, and that ensures construction is completed in a manner that protects the watershed and does not result in significant cumulative impacts to the watershed.

Therefore, the cumulative effect on waterbodies and wetlands from the Atlantic Bridge and AIM Project would be temporary and minor.

### Vegetation and Wildlife

When projects are constructed at or near the same time, the combination of construction activities could have a cumulative impact on vegetation and wildlife in the same affected environments. Clearing, grading, and other construction activities associated with the AIM Project and Atlantic Bridge Project would result in the removal of vegetation, alteration of wildlife habitat, displacement of wildlife, and other secondary effects such as forest fragmentation and establishment of invasive plant species.

For each project, Algonquin would implement mitigation measures to minimize the potential for erosion and to minimize the degree and duration of the impact on vegetation and wildlife, which measures would be required in the applicable federal and state permits. These measures include revegetating disturbed areas, increased stabilization of site conditions, and control of the spread of noxious weeds and other invasive species. Because a significant portion of the proposed pipeline facilities for both projects would be within Algonquin's existing pipeline ROWs, public roadways, railways and/or other utility ROWs, impacts on vegetation and wildlife would be minimal. Therefore, while the cumulative effect on vegetation and wildlife from the AIM Project and Atlantic Bridge Project could result in some time delay in the restoration of impacted vegetated areas where construction of the two projects are located in the same affected environment, the overall impact is still temporary and expected to be minor.

### Cultural Resources

Past disturbances to cultural resources are typically related to urban development, accidental disturbances, intentional destruction or vandalism, lack of awareness of historic value, and construction, maintenance, and operations associated with existing infrastructure. Federally regulated projects would include mitigation measures designed to avoid or minimize additional direct impacts on cultural resources. Non-federal actions would need to comply with any identification procedures and mitigation measures required by the states of New York, Connecticut, Rhode Island and Massachusetts for properties listed or eligible for listing on state registers. As has occurred for the AIM Project, the Atlantic Bridge Project would be subject to review under Section 106 of the National Historic Preservation Act, which requires consultation with State Historic Preservation Officers ("SHPOs") and Indian Tribes in order to ensure such project minimizes impacts to historic properties and archaeological resources, including properties listed or eligible for listing on the National Registers of Historic Places. Algonquin has also developed specific plans to address unanticipated discoveries of cultural resources and human remains in the event they are discovered during construction for the AIM Project, and it is expected a similar plan for review by the relevant SHPOs would be prepared for the Atlantic Bridge Project. Accordingly, it is not expected that the AIM Project and Atlantic Bridge Project would result in significant cumulative impacts to cultural resources, particularly since both projects would be constructed generally within existing disturbed ROW.

### Socioeconomics

The Atlantic Bridge Project and the AIM Project would generate temporary construction jobs. The supply of construction workers needed for these projects may be derived from workers

employed near the construction areas. This would provide a direct economic benefit to those individuals and the communities in which they reside. The non-local laborers involved with each project would represent an increase in the percent of the total population in each of the project areas; however, the potentially vacant rental units available in both project areas would offer enough housing for non-local workers. In addition, the Atlantic Bridge Project counties have the necessary infrastructure to provide public services and utilities to support that project.

There would be positive cumulative economic benefits from these two projects. Taxes generated from operation of the projects would result in an annual tax revenue increase. Permanent employment would also increase as a result of the operation and maintenance of these projects, with the cumulative benefit of potentially lowering local unemployment rates over a several-year period.

Construction work would occur generally within existing ROW within the Towns listed in Table 1.1, which represent different economic and ethnic backgrounds. Accordingly, the two projects would not result in a disproportionate impact to environmental justice communities.

### Land Use

The Atlantic Bridge Project and the AIM Project would result in both temporary and permanent changes to current land uses. It is anticipated that 100 percent of the 52.5 miles of Atlantic Bridge Project pipeline facilities would be within or adjacent to existing ROW, consisting primarily of Algonquin pipeline ROW, and including small areas of public roadways, railways, and/or other utility ROWs. Approximately 700 acres of land area could be affected by the Atlantic Bridge Project during construction and operation. Much of this land would be within existing ROW (approximately 390 acres), but the Atlantic Bridge Project could require approximately 110 acres of new permanent ROW. New permanent impacts on land use would be minimal, however, because the majority of the land affected by construction of the Atlantic Bridge Project would be allowed to revert to prior uses following construction. No additional restrictions would be required, except for a small area of land that would be required for the new permanent pipeline easement, operation of aboveground facilities, and permanent access roads. Following construction, the majority of affected areas would be restored and relinquished back to the landowner without restrictions. Some new restrictions would be imposed on the new permanent ROW, but primarily these would be limited to activities such as deep excavations or the construction of new, permanent structures that could threaten the integrity of the pipeline or preclude Algonquin's ability to maintain the pipeline. Because a relatively small area of land used by the Atlantic Bridge Project would be converted to another land use type and because construction would be short term, the cumulative effect on land use from both the AIM Project and Atlantic Bridge Project would be temporary and minor.

### Traffic, Parking, and Transit

There is little potential for cumulative traffic, parking and transit impacts from the Atlantic Bridge Project since it is not scheduled to take place at the same time as the AIM Project. Several factors would minimize the potential for cumulative traffic impacts, including the total distance of the Atlantic Bridge Project and the tendency for construction workers to frequently

share rides and travel to and from work during off-peak hours. Construction would be scheduled for work within roadways and specific crossings so as to avoid commuter traffic and schedules for school buses and local city transit buses to the greatest extent practical. To minimize traffic delays at open-cut road crossings, Algonquin would establish detours before cutting these roads. If no reasonable detours are feasible, at least one traffic lane of the road would be left open, except for brief periods when road closure would be required to lay the pipeline. Appropriate traffic management and signage would be set up and necessary safety measures would be developed in compliance with applicable permits for work in the public roadway. Traffic safety personnel would be on hand during periods of construction. Provisions would be made for detours or otherwise to permit traffic flow. On-street parking may also be temporarily impacted during construction.

Some landowners, however, that are located adjacent or in proximity to work areas that involve pipeline construction, modifications to compressor stations, or modifications to metering stations for the AIM Project and Atlantic Bridge Project would notice construction, along with the temporary traffic and parking impacts described above, over two construction periods (i.e., potentially construction in 2016 and 2017). However, while the cumulative impact of the two projects would thus result in some additional impact related to the duration of the construction period for work on the interstate natural gas pipeline system, construction during each of these construction periods for the two projects is overall relatively short and thus would not result in significant cumulative adverse impacts due to construction traffic and parking. Similarly, some municipalities would notice additional construction vehicles using municipal roads over two construction periods, but the number of construction vehicles is overall small for each project and thus also would not result in significant adverse cumulative impacts.

Given each project's short duration of construction activities, cumulative impacts on traffic, parking and transit would be temporary and minimal.

### Infrastructure and Public Services

The cumulative impact of the Atlantic Bridge Project and the AIM Project on infrastructure and public services would depend on the specific services required for each project. Operation of the Atlantic Bridge Project would not have a major impact on public services since it would not require the construction of new public roads, extensive new sewer or water systems, or result in significant changes in local population levels.

### Air Quality and Noise

Both the AIM Project and Atlantic Bridge Project would have short-term impacts on air quality related to construction activities. Such activities would result in combustion emissions from the operation of construction equipment, commuting construction workers, and equipment delivery vehicles, as well as fugitive dust emissions from soil excavation and other construction activities. However, the AIM Project would be constructed in 2016 and the Atlantic Bridge Project is currently anticipated to be constructed in 2017. Therefore, construction of the two projects would not overlap. As discussed above, some landowners that are located in close proximity to both the AIM Project and Atlantic Bridge Project would notice increased emissions

and fugitive dust and noise during two construction years. As occurred for the AIM Project, Algonquin would be required to examine construction emissions pursuant to Clean Air Act General Conformity regulations for the Atlantic Bridge Project. Moreover, it is expected that FERC would also require the development of a Fugitive Dust Control Plan for the Atlantic Bridge Project as is required for the AIM Project. Moreover, work is expected to occur during the day and not at nighttime hours and construction must be in compliance with FERC noise standards. Thus, it is not expected that landowners and other individuals located near both the AIM Project and Atlantic Bridge Project work areas would be subject to cumulative impacts on air or noise quality from construction activities.

The AIM Project and Atlantic Bridge Project would also result in air quality impacts from ongoing operation of the pipeline and aboveground facilities. However, meaningful quantification of the air quality impacts from the Atlantic Bridge Project cannot be provided at this time because the individual customer requirements have not yet been fully determined, and the resultant Atlantic Bridge Project facilities are as yet not clearly defined. [Note that, as discussed below, both projects are subject to regulation under the CAA and state law.]

Nevertheless, with respect to pipeline and metering and regulating (M&R) station operating emissions, both projects primarily involve modifications to existing facilities, which would likely not result in sufficient amounts of new air emissions that could significantly affect air quality either individually or cumulatively. With respect to compressor station operating emissions, all proposed work for both projects would be subject to ambient air quality analyses, pursuant to applicable federal and state air permitting requirements, as a prerequisite to receiving regulatory approvals. Prior to issuance of air quality approvals, the authorities must make a determination that the cumulative effect of both projects would not cause or contribute to an exceedance of ambient air quality standards, that the appropriate level of control of new air emissions would be installed, and that the compressor stations would be in compliance with all applicable federal and state air quality regulations and permit conditions. All of these factors would minimize the potential ambient air quality impacts from both projects. Further development would ultimately be restricted or disallowed should ambient air quality become threatened.

In addition, both federal and state air quality improvement policies and regulations acknowledge and support the increased use of natural gas as an important step in improvement of air quality on a local and regional basis. To the extent that the new gas supplies are used to displace the use of other, more polluting fossil fuels, the cumulative effect from the AIM and Atlantic Bridge Projects is expected to have a net positive impact on air quality.

### Conclusion

The majority of cumulative impacts that could result from the AIM Project when considered in combination with the Atlantic Bridge Project would be temporary and minor. Cumulative impacts that could occur on wetland and upland vegetation and associated wildlife habitats are expected to be minor given that most of the construction work would occur along existing ROWs for both projects, and over time, impacts to wetland and vegetated areas would mostly be restored to their pre-construction condition except in locations of new permanent easement where wetland functions may change. Some landowners and municipalities could also be affected construction over two different construction periods, but overall construction for each

project is expected to be for a short duration at any one location along the Algonquin system. Some positive cumulative benefits to the community could be realized from increased tax revenues. Short-term cumulative benefits could also be realized through jobs and wages and purchases of goods and materials.

Re: CORRECTED COPY: Town of Dedham Comments on Draft Environmental Impact  
Statement (Algonquin Gas Transmission, LLC)  
Docket No. CP14-96-000

---

Dear Ms. Bose:

Enclosed please find a corrected copy of a letter that was sent by mail, and was filed electronically in the above matter, on September 29, 2014. The original copy was missing Page 5. Please disregard the previous letter and replace it with the enclosed. We are filing this copy electronically, as well.

Thank you for your courtesy and understanding in this matter.

Very truly yours,

A handwritten signature in blue ink, appearing to read 'John J. Goldrosen', is written over a light blue circular stamp.

Re: Town of Dedham Comments on Draft Environmental Impact Statement  
(Algonquin Gas Transmission, LLC)  
Docket No. CP14-96-000

---

Dear Ms. Bose:

The Town of Dedham, Massachusetts ("Town" or "Dedham") hereby submits the following comments on the Draft Environmental Impact Statement ("DEIS") for the Algonquin Incremental Market Project ("Project"). Dedham is particularly and directly affected by the West Roxbury Lateral ("Lateral"), which will be constructed through the Town. The Town Board of Selectmen is submitting a separate letter to state its opposition to the Project. This letter is intended to provide more detailed comments on issues that are either addressed insufficiently in the DEIS, or on which the Town disagrees with conclusions stated in the DEIS.

The Lateral will be constructed along a south to north route through the Town, from an existing Algonquin facility in Westwood to a new metering and regulation station in West Roxbury ("M&R Station"). About 2.9 miles of the Lateral will be located within the Town, nearly all of which will be located within densely developed residential and commercial areas. (DEIS, pp. 2-13, 19). The Lateral will also pass through Gonzalez Field, a Town-owned park that is used for recreational purposes.

As discussed below, the DEIS does not take a sufficiently broad view of the available alternatives to meet the stated objective of the Lateral, which is to provide additional gas supplies to Boston Gas (a division of National Grid). Instead, the DEIS assumes that, to meet that objective, the M&R Station must be built in West Roxbury, and the Lateral must pass through Dedham to reach the M&R Station. Further, even under an assumption that the Lateral is necessary to serve the Project purpose, the DEIS does not adequately evaluate alternative routes through Dedham that would reduce impacts on residential areas and avoid Gonzalez Field. Finally, assuming that the Project were to be constructed in its proposed location through the Town, we offer comments on additional measures that should be considered to reduce or mitigate impacts from the construction and operation of the Project, including construction scheduling, noise, traffic, public roadways and property, and safety.

**KOPELMAN AND PAIGE, P.C.**

Ms. Kimberly D. Bose  
 Secretary

 Page 2

I. Alternatives to Routing the Lateral Through Dedham and West Roxbury

The stated objective of the Project, as a whole, is to increase overall natural gas supplies to New England, while the particular objective of the Lateral is to provide increased supplies to Boston Gas. According to the DEIS, the latter objective is to be met by locating the new M&R Station in West Roxbury. Even assuming that Boston Gas has a need for additional supplies, the DEIS fails to explain adequately why the additional connection to the Boston Gas system is to be located in West Roxbury, and the DEIS does not explore alternatives to such a connection.<sup>1</sup> Since there are existing Algonquin gas transmission lines that supply Boston Gas, the DEIS should identify and evaluate options to increase supplies using existing routes and existing M&R stations (such as the Ponkapoag M&R station), by modifying or increasing the capacity of those facilities.

Further, if there are technical reasons why a new M&R station is necessary to provide the requested supplies to Boston Gas, the DEIS does not explain the basis for the selection of a site in West Roxbury, rather than in another location within the large region served by Boston Gas. Finally, even if one were to accept the assumption that the selected location for the M&R Station is the most feasible alternative, the DEIS does not examine alternatives to the Westwood/Dedham/West Roxbury route that could be used to reach the West Roxbury site for the M&R Station, using other principal south-to-north roads (e.g., Routes 138 or 28) or west-to-east roads (e.g., Route 9).

In short, based on the narrow focus of the DEIS, it appears that the selection of the West Roxbury M&R Station location was taken as a “given,” as was the assumption that the new M&R Station was to be supplied through a connection to the existing Westwood facility. If the beginning and endpoints of the Lateral are accepted without examination, the most direct route is, indeed, through Dedham. The Town objects to this predetermination of the Lateral’s route, and requests that the DEIS be revised to expand the geographical scope of the alternatives analysis.

II. Alternatives Within Dedham for the Selected Westwood/Dedham/West Roxbury Route for the Lateral

The DEIS examines two alternatives to the Lateral route that Algonquin has selected, involving modifications of the route at its southern and northern ends. Although the southern

---

<sup>1</sup> The DEIS states: “According to Algonquin, Boston Gas has requested a new delivery point in the West Roxbury section of the City of Boston to enhance and reinforce the existing Boston Gas delivery system and support long-term growth in the area.” (DEIS, p. 3-15). This suggests that the location of the West Roxbury M&R Station, and the consequent location of the Lateral, has been determined by Boston Gas, not by the evaluation of alternatives.

**KOPELMAN AND PAIGE, P.C.**

Ms. Kimberly D. Bose  
 Secretary  
 September 29, 2014  
 Page 3

alternative, identified in the DEIS as the “West Roxbury Lateral South End Alternative Route” (“South End Alternative”), would reduce impacts on residential areas within Dedham, the DEIS concludes that the South End Alternative “would not be preferable to or provide an environmental advantage over the proposed route.” (DEIS, p.3-26). The Town disagrees with this conclusion, which gives insufficient weight to the interests of Dedham residents.

The South End Alternative would follow a route along the north side of Interstate 95 and the northbound off-ramp from I-95 to the Boston-Providence Turnpike (“Highway”), and connect with the Highway at about Mile 1.2 of the Lateral.<sup>2</sup> This would replace a portion of the selected Lateral Route that passes through residential and commercial areas on Rustcraft Road and Elm Street, east and southeast of the Highway. As summarized in Table 3.5.3-1 (p. 3-24), the South End Alternative would involve much less construction within a roadway (0.1 compared to 0.6 miles), affect half as many residences within 100 feet of the transmission line (12 versus 24), and involve fewer road crossings (3 versus 5). Nonetheless, the DEIS favors the selected Lateral route, primarily, it appears, for the reason that:

“...installation of the [Lateral] adjacent to Interstate 95 would be inconsistent with MassHighway’s “Policy on the Accommodation of Utilities Longitudinally, Along Controlled-Access Highways,” which precludes the placement of utility infrastructure parallel to the interstate highway system absent extenuating circumstances.”

(DEIS, p. 3-24).<sup>3</sup> Thus, the DEIS allows a general policy of the Massachusetts Highway Department (“MassHighway”) to outweigh the interest of Dedham residents and businesses in avoiding the adverse impacts of the construction and operation of the pipeline. The Town does not concede that MassHighway should have veto power over an alternative route, when municipalities do not have that degree of control over the Project. Further, the DEIS does not indicate whether any formal request has been made to MassHighway to accept the South End Alternative. Perhaps, if asked, MassHighway would determine that the reduction in impacts on local residents and businesses would be “extenuating circumstances” that would justify waiving its policy for this Project.

Evaluating the South End Alternative by the stated criteria for the examination of alternatives in the DEIS (see p. 3-1), the South End Alternative: (i) meets the objectives of the Project as well

---

<sup>2</sup> Section 3.5.3, third line, on p. 3-24, states that the direction of the South End Alternative would be from the north side of I-95 “to the east/northeast for about 0.5 mile....” The direction is actually to the west/northwest.

<sup>3</sup> The DEIS does list some other disadvantages of the South End Alternative, but none of those appear to be insurmountable or incapable of mitigation.

**KOPELMAN AND PAIGE, P.C.**

Ms. Kimberly D. Bose  
 Secretary  
 September 29, 2014  
 Page 4

as the selected route; (ii) is “technically and economically feasible and practical”; and (iii) offers “significant environmental advantage” over the selected route. The Town requests that the South End Alternative be fully and objectively evaluated.

### III. Mitigating Impacts of the Selected Route

Assuming that the Lateral is to be built on the proposed route through Dedham, the Town has several comments on the assessment of environmental impacts and potential mitigation measures.

#### A. Traffic

As noted in the DEIS, the Project has the potential for serious disruption of traffic along the selected route, particularly along the Highway and at the intersection of High and East Streets. The DEIS is not as specific as it could be, as to which portions of the Project would be constructed during overnight hours (midnight to 8 AM), as compared with daytime construction. As noted in Table 4.9.5-1 (p. 4-183), traffic volumes are high throughout the daytime hours on weekdays, and on Saturdays as well.

While measures have been implemented to mitigate impacts at the intersections of the Highway and the entrances to Legacy Place, the intersection of High and East Streets has not been adequately addressed. The DEIS acknowledges that there would be “unavoidable significant adverse impacts, particularly at the High Street intersection with East Street and Harris Street.” (P. 4-187). The DEIS states that work at this intersection would be undertaken during “off-peak daytime hours,” and that “it will not be possible to maintain continuous two-way travel during most construction.” (P. 4-186, App. G-49). The Town questions whether this is a realistic approach, given the volume of traffic throughout the day at that intersection. Table 4, at App. G-52, indicates that the Level of Service at High Street would be reduced from B to F during construction, at either morning, midday, or evening hours. This may be a location at which overnight work should be considered, after further consultation with the Town. The decision as to the hours of construction should rest ultimately with the Town, and not with Algonquin.

#### B. Noise

Noise is a particular concern for Town residents along the proposed route. The Town notes that there is a residential area in the Prospect/Willow/Spruce Street neighborhood on the northwest side of the Highway, between the Dedham Plaza and the Eastern Avenue intersection with the Highway. The choice of nighttime construction along this portion of the Highway for purposes of traffic control, must be balanced against the additional impacts on residents caused by construction during sleeping hours. As noted above, closer consideration of the South End

**KOPELMAN AND PAIGE, P.C.**

Ms. Kimberly D. Bose  
 Secretary  
 September 29, 2014  
 Page 5

Alternative might result in eliminating construction impacts on residents of Rustcraft Road and Elm Streets.

C. Repaving of Town Streets

The Town seeks assurances that repaving of Town roadways will be “from curb to curb,” and not limited to the width of actual construction. The DEIS is not specific as to Algonquin’s commitment to this Town policy, stating only that the policy has been “reviewed” and that repaving would be “in accordance with applicable state and municipal requirements.” (P. 2-28, App. G-44). The Town wishes to be sure that its “curb-to-curb” policy will be observed, even if state law might, arguably, require only that pre-existing conditions be restored.

D. Gonzalez Field

The proposed route would cross Gonzalez Field, a Town-owned park and recreation area. Algonquin has discussed with the Town Parks and Recreation Commission whether there are alternative routes across Gonzalez Field that would reduce impacts on playing surfaces. There have also been discussions about timing construction so as to limit construction to the seasons of the year when the Field is not in use by sports teams. The Town wishes to clarify that these discussions have not resulted in any firm commitment by Algonquin or a final agreement. Further, based on the DEIS, the Project route has been altered by a “minor route variation” that would increase impacts on a soccer field, with the “advantage” of avoiding impacts with future expansions of the Harris Street bridge and the Highway by the Massachusetts Department of Transportation. (P. 3-27). As with the evaluation of the South End Alternative (see above), the interests of state agencies are being favored over those of the Town and its residents.

The DEIS requires Algonquin to file a “site-specific construction plan” for Gonzalez Field, prior to the end of the DEIS comment period, including the timing of construction and measures to be implemented to minimize conflicts with the use of the Field. (Pp. 4-163-4, 5-22-3). If such a plan has been or is to be filed, it should be clear that it has not yet been approved by the Parks and Recreation Commission on behalf of the Town. Nonetheless, the Commission is prepared to work cooperatively with Algonquin to develop and implement such a construction plan, if the final route crosses Gonzalez Field.

E. Timing of Construction

The DEIS notes that, to speed construction, two or three crews may be working on the Project in Dedham at a given time. There may be an advantage to the Town in having the Project completed as quickly as possible, to minimize the duration of disruption, but that must be balanced against the potential for an increased degree of disruption (particularly with respect to

**KOPELMAN AND PAIGE, P.C.**

Ms. Kimberly D. Bose  
 Secretary  
 September 29, 2014  
 Page 6

traffic), if the scheduling of the work is not carefully coordinated. It is difficult to strike this balance, without knowing how quickly work would be completed within a particular section, and in what order. Algonquin should be required to develop a complete construction schedule, and to review it with the Town and state officials both before construction commences and on a continuing basis, to monitor the amount and degree of impacts.

F. Public Safety

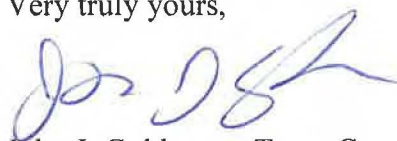

As the DEIS recognizes, the construction and operation of a high-pressure natural gas transmission line raises significant public safety concerns. The route within Dedham, for the most part, passes through heavily populated and developed commercial and residential areas, which are classified as "High Consequence Areas" for purposes of federal natural gas pipeline safety standards. (Pp. 4-255-259). The DEIS discusses procedures for "risk assessment," and for "integrity assessments" based on the level of risk. It is also stated that older pipelines are more likely to present problems from corrosion and material failure. (PP. 4-260-3). This suggests that the Project would be less likely to be inspected post-construction than existing facilities, perhaps for many years, because the Project would be deemed comparatively unlikely to pose a risk of failure. In response to the concerns about public safety, and in recognition of the intense development along the Lateral route, the Town requests that a condition be imposed that an integrity assessment be made within a shorter period of time after construction (e.g., 1-2 years), to ensure against any defects in materials or construction that might become evident within a relatively short time frame.

Conclusion

It is the Town's position that the DEIS does not examine the premises for the construction of the Lateral through Dedham, nor does it adequately assess alternatives to the selected route. The Project should not go forward until the DEIS is revised accordingly, and a further comment period is provided on the revised DEIS.

Nonetheless, if the Project moves forward, the Town requests that additional conditions and mitigation requirements be imposed, and that Algonquin be directed to work closely with Town and state officials to minimize Project impacts.

Very truly yours,

John J. Goldrosen, Town Counsel  
 On behalf of the Town of Dedham

ASSISTANT  
CITY CLERK

## CITY OF BOSTON • MASSACHUSETTS

OFFICE OF THE MAYOR  
MARTIN J. WALSH

September 26, 2014

Ms. Cheryl A. LaFluer, Chairman  
Federal Energy Regulatory Commission  
888 First Street, NE  
Washington, DC 20426

Re: Algonquin Gas Transmission, LLC  
FERC Docket No. CP14-96

Dear Commissioner LaFluer:

I am writing in regard to the Algonquin Incremental Market Project proposed by Algonquin Transmission, LLC (Algonquin). As Mayor of the City of Boston, I am deeply concerned about the impact that this proposed project may have on West Roxbury.

At the recent public hearing held in Dedham, Massachusetts, the community raised many issues that merit consideration by your agency. I share the concerns of the community and of other public officials about the impact that the proposed compressor pump station will have on the area. This station would be sited near an active quarry in West Roxbury. The dangers of natural gas are amplified by the proximity to a quarry where blasting occurs. The quarry abuts a densely populated area which in addition to residential neighborhoods includes the Deutsches Altenheim assisted care and nursing facility and Roxbury Latin School.

I recognize that Algonquin has been available to answer questions and discuss concerns, and has worked to mitigate certain impacts of the construction along the route. Of particular note are the changes Algonquin has made to its plan in order to mitigate some concerns surrounding the displacement of Saint Theresa's church and school in West Roxbury. It is of the utmost importance that FERC use this opportunity to ensure that Algonquin continues to thoroughly review all possible routes, and that the final decision provides the greatest degree of environmental protection and public safety.

The City's Office of Neighborhood Services has continued to receive inquiries and hear concerns from residents of West Roxbury. Due to the large number of inquiries and the critical nature of this project, I respectfully request that the comment period set to end September 29, 2014, be extended. An extension of the comment period will allow residents to further inquire about the project and submit informed comments to the official docket.

J.A. - 0585

I hope that as we continue to work together to achieve energy independence we can also work to ensure that the concerns of residential neighborhoods are heard and addressed. Please be assured that my Administration is ready to work with you in this regard.

Thank you for your consideration on this important and time sensitive matter. If I may be of further assistance on this matter, please do not hesitate to contact me.

Sincerely,

A handwritten signature in black ink, appearing to read 'Martin J. Walsh', with a stylized flourish at the end.

projects, as both companies have proposed their projects for the same parcel of land at the intersection of 11<sup>th</sup> Street and Broadway, Verplanck.

- Village of Buchanan – resolution opposing Spectra Energy’s Algonquin Gas Transmission Line, urging FERC to protect the rights, health and safety of the residents and deny the application in its entirety.

Copies of these actions are attached for your reference.

Other concerns are based on Spectra’s recently announced plans to expand natural gas pipeline capacity into the New England Market. FERC held a public hearing on the DEIS for the AIM project September 15, 2014, but Spectra’s planned expansion is not included in the DEIS. Therefore, the total and collective impacts of the project were not addressed. Also missing from the DEIS is a Hazards Analysis for Indian Point which is currently being performed by Entergy. The omission of the Hazards Analysis and Spectra’s expansion plans prevented members of the public from making informed comments on the project as a whole at the September 15 hearing.

Nearby residents also have questions about two other major energy projects proposed for their area. Champlain Hudson Power Express (CHPE) has just received approval from the U.S. Department of Energy to provide power to New York City by laying transmission lines through and around the Hudson River. WPP has proposed burying high voltage cables connecting the converter station in Athens, N.Y., with a high voltage converter station in Verplanck, N.Y. Both projects will run close to Indian Point, which has spent fuel rods and is located on the Ramapo fault line.

Based on all these concerns, I urge FERC to withdraw the current DEIS, evaluate and review the potential health and safety impacts of the AIM project in its entirety, and then issue a supplemental DEIS for public comment. While infrastructure and jobs are important considerations, we must take precautions to protect public health and safety and the environment.

Sincerely,

Nita M. Lowey  
Member of Congress

BOARD OF LEGISLATORS  
COUNTY OF WESTCHESTER,  
STATE OF NEW YORK

INTRODUCED BY:

LEGISLATORS PARKER & HARCKHAM

**Resolution No. - 2014**

**To ensure public safety and health  
regarding Spectra Energy's Algonquin Incremental Market (AIM) natural gas pipeline,  
compressor and metering stations expansion project**

WHEREAS, Algonquin Gas Transmission, LLC, a wholly-owned subsidiary of Spectra Energy Partners, submitted Resource Report #9 in Docket # CP14-96-000 which does not reflect aggregate (existing and proposed) and cumulative emissions from compressor stations, metering stations, and pipelines in the entire Algonquin Incremental Market project;

WHEREAS, peer-reviewed scientific studies indicate that emissions from compressor stations and other shale gas infrastructure are associated with negative health impacts;

WHEREAS, peer-reviewed scientific studies and the World Health Organization link exposure between air pollution and neurological, cardiovascular, respiratory and other health impacts;

WHEREAS, the current emissions will be significantly increased by the expansion of the Southeast and Stony Point compressor stations, and other gas pipeline infrastructure and operations (including but not limited to metering and regulating stations, pipelines, valves, fittings and pigging operations) and the tri-state region including Rockland, Westchester, and Putnam counties is already considered a non-attainment zone for air quality standards according to the U.S. Environmental Protection Agency and exceeds the limits for pollutants such as ground level ozone and particulate matter;

WHEREAS, there is presently no advanced notification for all planned compressor station and other gas pipeline infrastructure and operations blowdowns, either full or partial, or immediately following any unplanned partial or full blowdowns in order for residents and public officials to take prompt emergency measures;

WHEREAS, the location of the AIM pipeline within close proximity to the Indian Point Nuclear Facility and 40 years of spent fuel rods, and intersects with two proposed high voltage power lines, and in close proximity to a significant seismic zone, poses a risk of catastrophic damage with profound long-term impacts on the region;

WHEREAS, materials and contaminants in the gas pipeline include Radium precipitate, Radon and its decay products, Lead and Polonium, many of which are known carcinogens;

**WHEREAS, Algonquin Gas Transmission, LLC (AGT) has safely operated pipelines in Westchester County for more than 60 years;**

**WHEREAS, the AIM project will utilize local union labor and provide more than 300 short-term construction related jobs in Westchester County;**

**WHEREAS, the Westchester County Board of Legislators feels duty bound to protect the health and safety of all County residents and of all workers associated with the project;**

**THEREFORE, BE IT RESOLVED that an independent air emissions baseline assessment be conducted in the areas directly impacted by the proposed compressor and metering and regulating stations modifications before permitting, and be monitored by an independent expert acceptable to industry, local government officials, advocates and the public, funded by Spectra Energy, and that continuous emissions monitoring be conducted and results of the continuous monitoring of air, water, land and all other environmental impacts be reported daily to the New York State Department of Environmental Conservation the United States Department of Environmental Protection Agency and made available to the public in a transparent manner, and be it**

**FURTHER RESOLVED, that the best available mitigation technologies and practices be required to be installed on all components of the existing and proposed expansion of Algonquin Pipeline's compressor and metering stations including electric compressor engines, zero emission dehydrators, blowdown prevention, vapor recovery units, and methane capturing equipment and practices outlined by the U.S. Environmental Protection Agency, and if gas-driven engines are used instead of preferred electric engines, that selective catalytic reduction must be installed, and be it**

**FURTHER RESOLVED, effective immediately, advanced notification of all planned blowdowns, either full or partial, and notification within 30 minutes following any unplanned partial or full blowdowns of the Story Point and Southeast compressor stations and other gas pipeline infrastructure and operations (including but not limited to metering and regulating stations, pipelines, valves, fittings, and pigging operations) be given to the County of Westchester in order to alert all residents, police, fire departments and municipalities within Westchester County, and be it**

**FURTHER RESOLVED, that a comprehensive and transparent Health Impact Assessment (HIA), as outlined by the Centers for Disease Control and the National Academy of Sciences, be conducted by an independent entity acceptable to industry, local government officials, advocates and the public, and funded by Spectra Energy, and be it**

**FURTHER RESOLVED, that this comprehensive and transparent Health Impact Assessment (HIA) cover cumulative short-term and long-term as well as direct and indirect impacts of all infrastructure components and operations of the AIM project, including compressor stations emissions and blowdowns, metering and regulating stations emissions, and pipeline leakage prior to construction, during construction, during normal operations and during blowdowns and accidental release events, with a thorough analysis of all materials and contaminants in the pipeline, including Radium precipitate, Radon and its decay products, Lead and Polonium, and with a thorough analysis of the proposed Pipeline Inspection Gauge (PIG) launching staging areas and the handling, storage, cleaning, and disposal of PIGs, PIG wastewater, PIG launcher and all other associated equipment with PIG operations, and be it**

FURTHER RESOLVED, that a comprehensive, independent and transparent risk assessment of the potential catastrophic explosion of a 42" diameter high-pressure pipeline in close proximity to Indian Point Nuclear Facility and a significant seismic zone be conducted, and that assessment should be funded by Spectra Energy, to be completed in accordance with CFR Federal Law 50.59 and 10 CFR 100.20 regarding changes to site, and be it

FURTHER RESOLVED, that the Westchester County Board of Legislators opposes any construction of maintenance facilities located near schools, parks, houses of worship, business or residential districts or any other population centers and any current existing facilities near such locations be moved along the right-of-way, and be it

FURTHER RESOLVED that Spectra Energy comply with New York State Law since it has one of the highest standards of environmental protection by undergoing a full Environmental Impact Statement to comply with the requirements of the New York State Environmental Quality Review Act and minimize and mitigate any negative environmental impacts, and be it

FURTHER RESOLVED, that a copy of this resolution be sent to the Federal Energy Regulatory Commission and all involved Agencies with the request that the health, safety and planning concerns stated in this resolution be addressed and mitigated in the environmental review and all other review processes before project permissions be granted.

September 16, 2014

**RESOLUTION NO. 404 OF 2014  
URGING THAT HEALTH, SAFETY AND PLANNING CONCERNS BE  
ADDRESSED AND MITIGATED IN THE ENVIRONMENTAL REVIEW AND ALL  
OTHER REVIEW PROCESSES BEFORE PROJECT PERMISSIONS BE  
GRANTED FOR SPECTRA ENERGY'S ALGONQUIN INCREMENTAL MARKET  
(AIM) NATURAL GAS PIPELINE, COMPRESSOR AND METERING  
STATIONS EXPANSION PROJECT**

**CORNELL/LOW-HOGAN, SCHOENBERGER, SOSKIN, HOOD, JR., WOLFE:  
UNAN.**

WHEREAS, Algonquin Gas Transmission, LLC, (AGT) a wholly-owned subsidiary of Spectra Energy Partners which is seeking expansion of pipelines to serve customers in Massachusetts, Connecticut and Rhode Island, and affecting Rockland, Westchester and Putnam Counties, submitted Resource Report #9 in Docket # CP14-96-000 which does not reflect aggregate (existing, proposed and cumulative) emissions from compressor stations, metering stations, and pipelines in the entire Algonquin Incremental Market (AIM) project; and

WHEREAS, peer-reviewed scientific studies and the World Health Organization link exposure between air pollution and neurological, cardiovascular, respiratory and other health problems, while peer-reviewed scientific studies specifically indicate that emissions from compressor stations and other shale gas infrastructure are also associated with negative health impacts; and

WHEREAS, the current emissions will be significantly increased by the expansion of the Southeast and Stony Point compressor stations and other gas pipeline infrastructure and operations, including but not limited to metering and regulating stations, pipelines, valves, fittings and Pipeline Inspection Gauge (PIG) operations; and

**WHEREAS, the tri-state region - including Rockland, Westchester, and Putnam counties - is already considered a non-attainment zone for air quality standards according to the United States Environmental Protection Agency (EPA) and exceeds the limits for pollutants such as ground level ozone and particulate matter; and**

**WHEREAS, there is presently no advanced notification for all planned full or partial blowdowns at compressor stations, or immediately following any unplanned partial or full blowdowns in order for residents and public officials to take prompt emergency measures; and**

**WHEREAS, the location of the AIM pipeline: 1) is within close proximity to the Indian Point Nuclear Facility and 40 years of spent fuel rods; 2) intersects with two proposed high voltage power lines; and 3) is in close proximity to a significant seismic zone. This poses a risk of catastrophic damage with profound long-term impacts on the region; and**

**WHEREAS, materials and contaminants in the gas pipeline include radium precipitate, radon and its decay products, lead and polonium, many of which are known carcinogens and present a serious health risk both to local residents as well as the potentially hundreds of short-term construction-related workers in Rockland County; and**

**WHEREAS, the Rockland County Legislature feels duty bound to protect the health and safety of all County residents and all workers associated with the project; and**

**WHEREAS, the Environmental Committee has met, considered and by a unanimous vote, approved this resolution; now therefore be it**

**RESOLVED, that**

- 1) before permits are issued, an independent air emissions baseline assessment be conducted in the areas directly impacted by the proposed compressor and metering and regulating stations modifications;**
- 2) the pipeline be continually monitored by an independent expert acceptable to industry, local government officials, advocates and the public, funded by Spectra Energy; and**
- 3) results of the continuous monitoring of air, water, land and all other environmental impacts be reported daily to the New York State Department of Environmental Conservation (DEC) and the EPA, and made available to the public in a transparent manner;**

**and be it further**

**RESOLVED, that AGT be required: 1) to install the best available mitigation technologies on all components of the existing and proposed compressor and metering stations in the AIM pipeline project, including electric compressor engines,**

zero emission dehydrators, blowdown prevention, vapor recovery units, and methane capturing equipment; 2) to utilize the best practices outlined by the EPA; and 3) to install selective catalytic reduction if gas-driven engines are used instead of preferred electric engines; and be it further

**RESOLVED**, effective immediately, that advanced notification of all planned blowdowns (either full or partial) and notification within 30 minutes following any unplanned partial or full blowdowns of the Stony Point and Southeast compressor stations and other gas pipeline infrastructure and operations (including but not limited to metering and regulating stations, pipelines, valves, fittings, and Pipeline Inspection Gauge [PIG] operations) be given to Rockland County in order to alert all residents, emergency first responders, and municipalities within the County, and be it further

**RESOLVED**, that a comprehensive and transparent Health Impact Assessment (HIA), as outlined by the Centers for Disease Control and Prevention and the National Academy of Sciences, be conducted by an independent entity acceptable to industry, local government officials, advocates and the public, and funded by Spectra Energy, and be it further

**RESOLVED**, that this comprehensive and transparent HIA cover cumulative short-term and long-term impacts as well as direct and indirect impacts of all infrastructure components and operations of the AIM project, including compressor stations emissions and blowdowns, metering and regulating stations emissions, and pipeline leakage prior to construction, during construction, during normal operations and during blowdowns and accidental release events, with a thorough analysis of all materials and contaminants in the pipeline, including radium precipitate, radon and its decay products, lead and polonium, and with a thorough analysis of the proposed Pipeline Inspection Gauge (PIG) launching staging areas and the handling, storage, cleaning, and disposal of PIGs, PIG wastewater, PIG launcher and all other associated equipment with PIG operations, and be it further

**RESOLVED**, that Spectra Energy fund a comprehensive, independent and transparent risk assessment of the potentially catastrophic explosion of a 42" diameter high-pressure pipeline in close proximity to Indian Point Nuclear Facility and a significant seismic zone, to be completed in accordance with CFR Federal Law 50.59 and 10 CFR 100.20 regarding changes to site, and be it further

**RESOLVED**, that the Rockland County Legislature opposes the construction of maintenance facilities near schools, parks, houses of worship, business or residential districts or any other population centers, and be it further

**RESOLVED**, since New York has one of the highest standards of environmental protection, the Rockland County Legislature urges Spectra Energy to follow New York State law by undergoing a full Environmental Impact Statement to comply with the requirements of the State Environmental Quality Review Act (SEQRA) and thereafter minimize and mitigate any negative environmental impacts, and be it further

**RESOLVED**, that the Clerk to the Legislature be and is hereby authorized and directed to send a copy of this resolution to the Federal Energy Regulatory Commission and all federal and state involved agencies with the request that the health, safety and planning concerns stated in this resolution be addressed and mitigated in the environmental review and all other review processes before project permissions be granted; and to send a copy of this resolution to Hon. Barack H. Obama, President of the United States; Hon. Charles Schumer and Hon. Kirsten Gillibrand, United States Senators; Hon. Nita M. Lowey, Member of the United States Congress; the President Pro Tem of the United States Senate; the Speaker of the United States House of Representatives; the Majority and Minority Leaders of the United States Senate and House of Representatives, Hon. Andrew M. Cuomo, Governor of the State of New York; Hon. David Carlucci, Hon. William J. Larkin, Jr., New York State Senators, Hon. Kenneth P. Zebrowski, Jr., Hon. Ellen C. Jaffee, and Hon. James G. Skoufis, Members of the New York State Assembly; the President Pro Tem of the New York State Senate; the Speaker of the New York State Assembly; the Majority and Minority Leaders of the New York State Senate and Assembly and to such other persons as the Clerk, in his discretion, may deem proper in order to effectuate the purpose of this resolution.

I:\RESO\2014 RESOLUTIONS\8112014\RESO REGARDING SPECTRA ENERGY'S AIM PIPELINE (2).DOC

**RESOLUTION TO ENSURE PUBLIC SAFETY AND HEALTH REGARDING SPECTRA  
ENERGY'S ALGONQUIN INCREMENTAL MARKET (AIM) NATURAL GAS PIPELINE,  
COMPRESSOR AND METERING STATIONS EXPANSION PROJECT**

WHEREAS, Spectra Energy's proposed Algonquin Incremental Market (AIM) Natural Gas Pipeline would replace an existing gas pipeline and related infrastructure on public and private lands at the southern edge of the City of Peekskill with a larger, 42-inch diameter high-pressure pipeline in generally the same location; and

WHEREAS, the Common Council of the City of Peekskill has an interest in ensuring the health and safety of the people who live and work in this area and elsewhere in the community and surrounding region; and

WHEREAS, Algonquin Gas Transmission, L.L.C., a wholly-owned subsidiary of Spectra Energy Partners, submitted Resource Report #9 in Docket # CP14-96-000 which does not reflect aggregate (existing and proposed) and cumulative emissions from compressor stations, metering stations, and pipelines in the entire Algonquin Incremental Market project; and

WHEREAS, peer-reviewed scientific studies indicate that emissions from compressor stations and other shale gas infrastructure are associated with negative health impacts; and

WHEREAS, peer-reviewed scientific studies and the World Health Organization link exposure between air pollution and neurological, cardiovascular, respiratory and other health impacts; and

WHEREAS, the current emissions will be significantly increased by the expansion of the Southeast and Stony Point compressor stations, and other gas pipeline infrastructure and operations (including but not limited to metering and regulating stations, pipelines, valves, fittings and pigging operations) and the tri-state region including Rockland, Westchester, and Putnam counties is already considered a non-attainment zone for air quality standards according to the U.S. Environmental Protection Agency and exceeds the limits for pollutants such as ground level ozone and particulate matter; and

WHEREAS, there is presently no advanced notification for all planned compressor station and other gas pipeline infrastructure and operations blowdowns, either full or partial, or immediately following any unplanned partial or full blowdowns in order for residents and public officials to take prompt emergency measures; and

WHEREAS, the location of the AIM pipeline within close proximity to the Indian Point Nuclear Facility and 40 years of spent fuel rods, intersecting with two proposed high voltage power lines, and in close proximity to a significant seismic zone, poses a risk of catastrophic damage with profound long-term impacts on the region; and

WHEREAS, materials and contaminants in the gas pipeline include Radium precipitate, Radon and its decay products, Lead and Polonium, many of which are known carcinogens; and

WHEREAS, Algonquin Gas Transmission, LLC (AGT) has safely operated pipelines in Peekskill and Westchester County for more than 60 years; and

WHEREAS, the AIM project will utilize local union labor and provide more than 300 short-term construction related jobs in Westchester County; and

WHEREAS, the Common Council of the City of Peekskill is concerned about potential adverse environmental impacts during construction and subsequent operation of this pipeline, including but not limited to impacts to wetlands and to water quality in the Dickie Brook (a bordering stream), impacts to the Blue Mountain Reservation, impacts to health, safety, and property values in adjoining neighborhoods, impacts to city infrastructure (roads, bridges, culverts, utilities, etc.), and impacts to local and county emergency services; and

WHEREAS, such potential adverse environmental impacts would typically be evaluated through an Environmental Impact Statement (EIS) according to the State Environmental Quality Review (SEQR) Act and appropriate alternatives and mitigation strategies examined.

NOW, THEREFORE, BE IT RESOLVED that an independent air emissions baseline assessment be conducted in the areas directly impacted by the proposed compressor and metering and regulating

station modifications before permitting, and be monitored by an independent expert acceptable to industry, local government officials, advocates and the public, funded by Spectra Energy, and that continuous emissions monitoring be conducted and results of the continuous monitoring of air, water, land and all other environmental impacts be reported daily to the New York State Department of Environmental Conservation the United States Department of Environmental Protection Agency and made available to the public in a transparent manner; and be it

FURTHER RESOLVED, that the best available mitigation technologies and practices be required to be installed on all components of the existing and proposed expansion of Algonquin Pipeline's compressor and metering stations including electric compressor engines, zero emission dehydrators, blowdown prevention, vapor recovery units, and methane capturing equipment and practices outlined by the U.S. Environmental Protection Agency, and if gas-driven engines are used instead of preferred electric engines, that selective catalytic reduction must be installed; and be it

FURTHER RESOLVED, effective immediately, advanced notification of all planned blowdowns, either full or partial, and notification within 30 minutes following any unplanned partial or full blowdowns of the Stony Point and Southeast compressor stations and other gas pipeline infrastructure and operations (including but not limited to metering and regulating stations, pipelines, valves, fittings, and pigging operations) be given to the City of Peekskill and also to the County of Westchester in order to alert all residents, police, fire departments and municipalities within Westchester County; and be it

FURTHER RESOLVED, that a comprehensive and transparent Health Impact Assessment (HIA), as outlined by the Centers for Disease Control and the National Academy of Sciences, be conducted by an independent entity acceptable to industry, local government officials, advocates and the public, and funded by Spectra Energy; and be it

FURTHER RESOLVED, that this comprehensive and transparent Health Impact Assessment (HIA) cover cumulative short-term and long-term as well as direct and indirect impacts of all infrastructure components and operations of the AIM project, including compressor stations emissions and blowdowns, metering and regulating stations emissions, and pipeline leakage prior to construction, during construction, during normal operations and during blowdowns and accidental release events, with a thorough analysis of all materials and contaminants in the pipeline, including Radium precipitate, Radon and its decay products, Lead and Polonium, and with a thorough analysis of the proposed Pipeline Inspection Gauge (PIG) launching staging areas and the handling, storage, cleaning, and disposal of PIGs, PIG wastewater, PIG launcher and all other associated equipment with PIG operations; and be it

FURTHER RESOLVED, that a comprehensive, independent and transparent risk assessment of the potential catastrophic explosion of a 42" diameter high-pressure pipeline in close proximity to Indian Point Nuclear Facility and a significant seismic zone be conducted, and that assessment should be funded by Spectra Energy, to be completed in accordance with CFR Federal Law 50.59 and 10 CFR 100.20 regarding changes to sitc; and be it

FURTHER RESOLVED, that the Common Council of the City of Peekskill opposes any construction of maintenance facilities located near schools, parks, houses of worship, business or residential districts or any other population centers and any current existing facilities near such locations be moved along the right-of-way; and be it

FURTHER RESOLVED that Spectra Energy comply with New York State Law since it has one of the highest standards of environmental protection by undergoing a full Environmental Impact Statement to comply with the requirements of the New York State Environmental Quality Review Act and minimize and mitigate any negative environmental impacts; and be it

FURTHER RESOLVED, that a copy of this resolution be sent to the Federal Energy Regulatory Commission and all involved Agencies with the request that the health, safety and planning concerns stated in this resolution be addressed and mitigated in the environmental review and all other review processes before project permissions are granted; and be it

FURTHER RESOLVED, that this Resolution take effect immediately.

UNITED STATES OF AMERICA  
FEDERAL ENERGY REGULATORY COMMISSION

Algonquin Gas Transmission, LLC

Docket No. CP14-96-000

**MOTION TO INTERVENE OF THE TOWN OF CORTLANDT**

Pursuant to Section 15 of the Natural Gas Act, 15 U.S.C. § 717N, and Rule 214 of the Rules and Regulations of the Federal Energy Regulatory Commission ("FERC"), 18 C.F.R. § 385.214(b), the Town of Cortlandt ("Cortlandt" or "the Town"), moves to intervene and requests that FERC grant the Town full party status in the above-captioned proceeding on Algonquin Gas Transmission, LLC's ("Algonquin's") Abbreviated Application for a Certificate of Public Convenience and Necessity and Related Authorizations under Sections 7(b) and 7(c) of the Natural Gas Act (the "Application") for the proposed Algonquin Incremental Market Project ("AIM Project"). In support of its motion, Cortlandt asserts the following:

1. Correspondence or communications with respect to this proceeding should be addressed as follows:

Daniel Riesel  
Sive, Paget & Riesel, P.C.  
460 Park Avenue, 10th Floor  
New York, NY 10022  
646-378-7224  
212-421-1891 (fax)  
driesel@sprlaw.com

Tom Wood  
Cortlandt Town Attorney  
2131 Albany Post Road  
Montrose, NY 10548  
914-736-0930  
914-736-9082 (fax)  
tfwesq@aol.com

Daniel Mach  
Sive, Paget & Riesel, P.C.  
460 Park Avenue, 10th Floor  
New York, NY 10022  
646-378-7291  
212-421-1891 (fax)  
dmach@sprlaw.com

2. Cortlandt is a township located on the eastern bank of the Hudson River, in the northwestern corner of Westchester County, New York. It includes the incorporated villages of Croton-on-Hudson and Buchanan, as well as the unincorporated hamlets of Montrose, Crugers, and Verplanck. It has a population of approximately 41,500 residents.
3. On February 28, 2014, Algonquin filed the Application for authorization to construct and operate the AIM Project. The AIM Project would include the replacement of an existing 26-inch natural gas pipeline in Cortlandt with a 42-inch pipeline; the installation of pipeline along certain new routes within Cortlandt; the creation of a new pipeline crossing of the Hudson River between Cortlandt and the Town of Stony Point, New York, using horizontal directional drilling techniques; and the installation or modification of metering and regulating facilities in Cortlandt and along the border of Cortlandt and a neighboring municipality, the City of Peekskill. The Application was assigned Docket No. CP14-96-000.
4. On March 18, 2014, FERC issued a Notice of Application for the proceeding, which set a comment date of April 8, 2014, and provided that any entity wishing to become a party to the proceeding should file a motion to intervene on or before the comment date.
5. Cortlandt represents interests that will be directly affected by the outcome of this proceeding, within the meaning of FERC Rule 214, 18 C.F.R. § 385.214(b)(ii). The AIM Project would replace or install approximately 7.3 miles of pipeline within the Town of Cortlandt, including .7 miles within the Hamlet of Verplanck and 1.1 miles within the Village of Buchanan.<sup>1</sup> It also would modify two metering and regulating stations in or adjacent to Cortlandt.<sup>2</sup> The replacement, installation, and modification of those facilities would directly impact Cortlandt's residents, many of whom live adjacent to or in close proximity to segments of

---

<sup>1</sup> Algonquin Resource Report 1, at 1-7, Table 1.3-1.

<sup>2</sup> *Id.* at 1-12, Table 1.3-2.

the proposed pipeline route. The impacts of construction and operation of the AIM Project on the Town and its residents may include public safety hazards; traffic and transportation disruptions (with related interruptions of public services); noise generation; air pollution; disruption of wetlands and aquatic ecosystems; and adverse effects on the Town's scenic, historic, and cultural resources.

6. Cortlandt's participation in this proceeding is also in the public interest within the meaning of FERC Rule 214, 18 C.F.R. § 385.214(b)(iii). As the representative of numerous residents who will bear the AIM Project's adverse environmental, social, and economic impacts, Cortlandt requires party status in the proceeding to ensure that those residents' voices are heard. As a party to this proceeding, and on behalf of itself and its residents, the Town will assist FERC in evaluating the environmental impacts of the AIM Project on the communities surrounding it and in assessing the asserted public need for the requested pipeline expansion.

7. The interests that Cortlandt represents cannot be represented adequately by any other party because no other municipal entity represents the residents of the Town's unincorporated areas, because many of those residents lack the resources to represent themselves, and because no other entity shares Cortlandt and its residents' interests in the outcome of the proceeding.

8. As a municipality that has an interest in the outcome of this proceeding based on the impacts the proposed project would have on it and its residents, Cortlandt is entitled to party status under 15 U.S.C. § 717N(e) and 18 C.F.R. § 385.214(b).

9. Granting Cortlandt party status will not result in any disruption of this proceeding or cause any undue burden or prejudice to any other party.

10. The Town therefore seeks to intervene so that it may assist FERC in ensuring that the AIM Project is constructed and operated in a safe manner; that the Application demonstrates that

public convenience and necessity require the AIM Project; and that the AIM Project does not impose undue burdens on the Town, its residents, and the general public.

Respectfully submitted,

SIVE, PAGET & RIESEL, P.C.  
*Attorneys for the Town of Cortlandt*

**Village of Buchanan  
Mayor & Board of Trustees  
Regular Board Meeting  
June 2, 2014**

**PRESENT:**

Mayor Theresa Knickerbocker

Trustees Richard A. Funchion, Nicolas Zachary, Duane M. Jackson and Cesare Pasquale

Village Administrator Kevin Hay

Village Attorney Stephanie V. Porteus

Village Board Secretary Susan F. Matthews

**1. PLEDGE OF ALLEGIANCE:**

Mayor Knickerbocker opened the meeting at 7:30 PM, welcomed everyone, informed them of the fire regulations and led the Pledge of Allegiance.

**2. APPROVE MINUTES:**

February 18, 2014, Workshop Meeting: A MOTION to adopt these minutes as read was made by Trustee Funchion, seconded by Trustee Jackson with all in favor.

April 2014 Organizational Meeting: Mayor Knickerbocker amended page 8, paragraph 1, to change "center of the Village" to "down Broadway and also come into the Village Of Buchanan." A MOTION to adopt these minutes as amended was made by Trustee Funchion, seconded by Trustee Zachary with all in favor.

**3. COMMENTS FROM THE FLOOR: (agenda items only):**

None

**4. NEW BUSINESS:**

**a) 14-23 RESOLUTION REFERRING REQUEST FOR ZONING AMENDMENT TO PLANNING BOARD (GRIFFIN LANDSCAPING)**

Mayor Knickerbocker read the Resolution (*copy attached*).

Mayor Knickerbocker advised that the Village Board has had many discussions at our meetings about this application. They have gone to see one of the properties that Mr. Balter has done in Peckskill. This Resolution is to now send this to the Planning Board to come back with

Trustee Zachary commented that Trustee Funchion summed it up very well and what he said is very true. You may not hear some of the sounds during the day when there are other sounds around. But in the evening and when it is normally quiet around here, sound does carry. You will hear the converter station which is going to be near our border in Verplanck. Trustee Zachary believes it will affect the property values in our area. It is important to attend the protest rally at Letteri field at 6 PM on June 18. He commented that it is very important that we have a good showing to demonstrate that this is not just a few people protesting it. We do not want to be taken advantage of. He commented that this is the age of "Not in my backyard!" and that we have hosted an important source of power in this community for 50 years. We do not want it to translate into "You can do whatever you want here." You have to put a stop to this.

A MOTION to adopt this Resolution as presented was made by Trustee Funchion, seconded by Trustee Jackson with all in favor.

**c) 14-25 RESOLUTION OPPOSING SPECTRA ENERGY'S ALGONQUIN GAS TRANSMISSION LINE.**

Mayor Knickerbocker read the Resolution (*copy attached*).

Mayor Knickerbocker explained that they are proposing a new 42 inch pipeline beneath the river from Stony Point to Verplanck, through the Village of Buchanan to Yorktown Heights and 8 miles of line between Southeast and Danbury, Connecticut. The Mayor met with the Spectra people last week. They had a long discussion. She told them many times that we are totally against this application. What concerns her most is the close proximity, to within 500 feet of, our school. She told them that is not happening. They showed her the route. The Mayor advised that when we speak next week, she has the map and can show where the pipeline would go. She noted that currently there is an existing gas line on the Entergy property. It comes in through the Entergy property at Bleakley Avenue. That is still going to exist. The proposed 42 inch line would come up in Verplanck, come up Broadway, come across just past the cemetery and shoot over to Bleakley Avenue. They would be coming across Bleakley Avenue. The Mayor noted that we just spent \$550,000 to redo that the road. She has advised Spectra that they would not be digging up that road and if that did happen, they would be repaving that complete road. She advised that at the upcoming meeting, there is a member of the task force who has a big piece of tubing so that you will be able to see how big a 42 inch line is.

Mayor Knickerbocker commented that we are unfortunately fighting two of these things at the same time but that there is strength in numbers. We have to stick together with our neighbors to have this not happen. Her biggest fear is not only that it is going through the Village but that if there is a catastrophic event, we really do not have what we need here to take care of it. They

assured her it is very safe. But the Mayor told them that they cannot say it is 100%. She commented that it is not a positive for the Village and we are fighting this.

Trustee Funchion commented that in both of these instances, they tout that they will use Eminent Domain to take the property and basically ignore the wishes of the community. That is a piece of publicity that has to be out there. These two projects are literally being forced down our necks. He commented why is it that Verplanck and Buchanan are becoming the Grand Central Station for power in the entire metropolitan area. We already have to deal with the nuclear power plants and the gas line underneath the power plant. We do have a fault there. He commented that there is an extremely little chance of something happening from an earthquake but if a gas explosion happens to think of what effect that would have on Indian Point. He noted that they will not use the line that already goes through Indian Point. This new line will be put into effect. The construction of it will be quite cumbersome on the people of Verplanck. As Spectra described it, there are these huge pipes that are pushed into and under the river. Trustee Funchion commented that the construction will be right in our face. He urged everyone to please come out to the meetings. Come to the demonstrations. Talk to your neighbors. Talk to the newspapers, businesses and any elected representatives because we have to battle this to the very end.

Trustee Zachary commented that there is no advantage to the Village. If you look at the risks versus rewards, you can come up with lots of risks but there are no rewards. He commented that there is a small amount of tax revenue for an underground gas pipe but it is like when you do an improvement to your house. It is amortized. It is broken down over 20 or 30 years. So what little tax we get would diminish every year. There is next to no advantage to the Village but there are plenty of risks. The Mayor advised that currently we get \$70,000 per year from Spectra for the lines coming in now.

A MOTION to adopt this Resolution as presented was made by Trustee Funchion, seconded by Trustee Zachary with all in favor.

**d) 14-26 RESOLUTION AUTHORIZING THE EMPLOYMENT OF SUMMER SEASONAL HELP.**

Mayor Knickerbocker read the Resolution (*copy attached*).

A MOTION to adopt this Resolution as presented was made by Trustee Funchion, seconded by Trustee Jackson with all in favor.

**e) 14-27 RESOLUTION AUTHORIZING THE EMPLOYMENT OF RECREATION PERSONNEL**

Re: *Algonquin Gas Transmission, LLC*, Docket No. CP14-96-000  
 Response to Comments on the Draft Environmental Impact Statement

Dear Ms. Bose:

On February 28, 2014, Algonquin Gas Transmission, LLC (“Algonquin”) filed with the Federal Energy Regulatory Commission (“Commission” or “FERC”) an Abbreviated Application for Certificate of Public Convenience and Necessity and for Related Authorizations for the Algonquin Incremental Market Project (“Project”) in the above-referenced docket. On August 6, 2014, the Commission Staff issued its Draft Environmental Impact Statement (“DEIS”) for the Project. The Commission requested comments on or before September 29, 2014. Algonquin filed responses to the DEIS, including FERC Staff’s recommended mitigation identified in Section 5 of the DEIS (“Staff Mitigation Recommendations”) on September 2, September 19, and September 29, 2014.<sup>1</sup>

Algonquin is responding to certain comments on the DEIS filed with the Commission by the September 29 deadline, as identified more fully in the narrative below and attachments provided herewith.<sup>2</sup>

## **I. Supplemental EIS**

Commenters have noted that the DEIS recommends that plans, technical reports, or other additional information be submitted to FERC prior to the end of the DEIS comment period or prior to commencement of construction, which time-frame the commenters claim “could result in the public and reviewing agencies not having the opportunity or adequate time to review and comment.”<sup>3</sup> The DEIS was not required to include this information to be complete, however.

<sup>1</sup> Supplemental Information of Algonquin Gas Transmission, LLC Including a Response to Condition Number 31 of the DEIS, Docket No. CP14-96-000 (submitted Sept. 2, 2014) (“September 2 Supplemental Information”); Supplemental Information of Algonquin Gas Transmission, LLC re Conditions Number 29, 30, & 31 of the DEIS, Docket No. CP14-96-000 (submitted Sept. 19, 2014) (“September 19 Supplemental Information”); Algonquin Gas Transmission, LLC Supplemental Information – Route Variations, Docket No. CP14-96-000 (submitted Sept. 29, 2014) (“September 29 Supplemental Information”).

<sup>2</sup> Algonquin is responding to certain technical comments on the DEIS in Attachment A. To the extent necessary, Algonquin may file a response to address comments filed after September 29, 2014.

<sup>3</sup> Comment of the Environmental Protection Agency on DEIS at 6-7, Docket No. CP14-96-000 (submitted Sept. 29, 2014) (“EPA Comments”). *See also* Comment of Stop the Algonquin Pipeline Expansion at 2-3, Docket No. CP14-96-000 (submitted Sept. 29, 2014) (“SAPE Comments”); Comment of Reynolds Hills, Inc. on DEIS at 3, Docket No. CP14-96-000 (submitted Sept. 29, 2014) (“Reynolds Comments”); Comment of Earthworks Oil & Gas Accountability Project on DEIS at 1-2, Docket No. CP14-96-000 (submitted Sept. 29, 2014) (“Earthworks

Ms. Kimberly D. Bose, Secretary

October 14, 2014

Page 16

the EM&CP until after the NYPSC issues an Article VII Certificate of Environmental Compatibility and Public Need, it is expected that WPP's EM&CP would propose (and the NYPSC would require) appropriate mitigation for potential impacts similar to that described above for the Project.

Many commenters also asked to review the detailed engineering drawings that will be developed as part of the interference studies. However, detailed drawings are not a requirement of NEPA but rather are developed as part of the ongoing design of a project before construction commences. Corpro, on behalf of Algonquin, is currently preparing the interference studies based on WPP's preferred alignment as recently revised in the filing to the NYPSC on September 12, 2014. WPP and Algonquin will continue to consult so that each project will be designed so as not to interfere with the other.

### ***Atlantic Bridge & Access Northeast Projects***

As explained above, because the details of the Atlantic Bridge and Access Northeast projects are developing, site-specific effects from these projects are not reasonably foreseeable. The Commission has included a discussion of the cumulative impacts of the Atlantic Bridge project, which is consistent with NEPA.<sup>75</sup> The Commission considered the Atlantic Bridge project in the DEIS, and determined that the project would not occur at the same time as the Project and that details about the project are largely unknown.<sup>76</sup> It is not the case that the Commission ignored the Atlantic Bridge project. Rather, it determined that the project was not at the time of the DEIS sufficiently certain to require its environmental effects be taken into account with the Project.<sup>77</sup>

Algonquin has begun to study the feasibility of an Atlantic Bridge project, which involved conducting surveys along the existing pipeline right-of-way and meeting with landowners and municipal officials. Because of this early outreach, Algonquin recognizes that many of the commenters expect that the Atlantic Bridge is a proposed project and have asked that the EIS include a cumulative analysis of the two projects.<sup>78</sup> As stated above, there is still no proposed Atlantic Bridge project because no precedent agreement has been executed with any shipper in order that a proposed action can be formally developed and proposed. However, in response to comments made at the DEIS public hearings and at the request of the Commission Staff, Algonquin has provided the Commission with a map-level cumulative analysis of a future Atlantic Bridge project that may contribute cumulative impacts to the same affected environments as those of the Project. This information was filed as part of Algonquin's

---

<sup>75</sup> See DEIS at 4-272.

<sup>76</sup> *Id.*

<sup>77</sup> See *Minisink Residents for Env'tl. Pres. and Safety, et al., v. FERC*, 762 F.3d 97, 109 (D.C. Cir. 2014) (holding that the Commission did not "'close its eyes' to the issue of 'future expansion'" after considering a future project and concluding that the future project was sufficiently uncertain and did not consider its environmental effects in connection with the Minisink Project).

<sup>78</sup> See, e.g., Comments of Croton Watershed Clean Water Coalition on DEIS at 4, Docket No. CP14-96-000 (submitted Sept. 3, 2014) ("CWCWC Comments") (noting the cumulative impact of the Atlantic Bridge project on wetlands and water quality in the Croton Watershed).

Ms. Kimberly D. Bose, Secretary  
 October 14, 2014  
 Page 17

comments to the DEIS on September 29, 2014. However, given the preliminary nature of the Atlantic Bridge project, changes to the routing and design discussed in the map-level cumulative analysis are expected should such project actually move forward.

The Access Northeast project referred to by commenters is in preliminary stages of development. This project is being discussed in response to electric utilities in New England requiring additional firm natural gas supplies in year 2018 and beyond. At this time, there has been no open season held for the Access Northeast project and it is very early to attempt to establish the scope of such project. Given that the Access Northeast project is at the early stages of development, potential project effects are not reasonably foreseeable and would be speculative at this time. Thus, NEPA does not support a cumulative impacts analysis of the Access Northeast project.

### ***Natural Gas Production***

As explained above, the Commission need not analyze the indirect effects of natural gas production in the Marcellus and Utica shale regions because there is no “reasonably close causal relationship” between that development and the Project. Moreover, the Commission is not required to consider the cumulative effects of this development because such effects are outside of the geographic area of the Project.

Commenters incorrectly claim that the Commission’s cumulative effects analysis is deficient because its scope is limited to the vicinity of the Project.<sup>79</sup> For example, commenters have argued that the geographic scope of the cumulative effects analysis is too narrow, primarily because it excludes upstream gas development. In particular, commenters suggest that natural gas production could be occurring many miles upstream of the Project, and that because pipeline projects are a “key link in the chain, connecting supply to markets,” upstream development should therefore be considered as a cumulative effect even though it does not occur in the vicinity of the project.<sup>80</sup> But as explained above, cumulative impacts are limited to those occurring in the same affected environments as the proposal subject to NEPA review. Opponents of the Project cannot conflate the tests for indirect and cumulative effects in an effort to expand the scope of the EIS to include every possible effect with some tangential “linkage” to the Project.

The cumulative effects analysis “is a measurement of the effect of the current project along with any other past, present, or likely future actions *in the same geographic area*.”<sup>81</sup> Neither NEPA nor its implementing regulations require an agency to look outside the environment affected by the proposed project when considering cumulative effects. The purpose of a cumulative effects analysis is to determine whether the incremental impact of the proposed project, when added to the effects of other past, present, and reasonably foreseeable future projects, leads to a significant effect. It would not make sense, therefore, to look beyond the

Docket #CP14-96-000

October 14, 2014

Members of FERC,

We, the undersigned members of the Boston City Council, write to formally request a Supplemental Draft Environmental Statement regarding the West Roxbury Lateral portions of the Spectra Algonquin Pipeline Expansion (AIM) project, because the current DEIS does not address alternatives for the delivery of additional gas to the West Roxbury area of Boston. Further, the DEIS fails to specifically address the safety and health issues associated with the introduction of a high-pressure gas line into a densely populated residential area or the location of a Metering & Regulating (M&R) Station across the street from an active quarry. We look forward to your decision and thank you for your consideration.

Sincerely,

# **STOP THE ALGONQUIN PIPELINE EXPANSION!**

29 Highland Rd.  
Rye, NY 10580

October 20, 2014

Secretary Kathleen Bose  
Federal Energy Regulatory Commission  
888 First Avenue NE, Room 1A  
Washington, DC 20426

**RE: Algonquin Incremental Market (“AIM”) Project:  
FERC Docket No. CP14-96-000**

Dear Secretary Bose:

Please accept the following supplemental comments on behalf of Intervenor Stop the Algonquin Pipeline Expansion (“SAPE”), on the Draft Environmental Impact Statement (“DEIS”) for the proposed Algonquin Incremental Market (“AIM”) Project (“Project”).

Of particular concern to SAPE members in Westchester County is the Stony Point to Yorktown Take-up and Relay. *See* Section 2.1.1.2. The Stony Point to Yorktown Take-up and Relay involves the construction of about 12.3 miles of 42-inch-diameter mainline pipeline in the Towns of Stony Point and Cortlandt (including the Hamlet of Verplanck and the Village of Buchanan), the City of Peekskill and the Town of Yorktown. The proposed take-up and relay includes two segments of replacement pipeline and one segment of pipeline construction within a new permanent right-of-way.<sup>1</sup> *See* DEIS at Section 2.1.1.2.

Notably, however, the 2.9-mile segment within a new permanent right-of-way (from MP 2.6 to MP 5.5) is not “take-up and relay” as that term is defined in the DEIS,<sup>2</sup> since it does not involve the removal of existing pipeline and replacement with new pipeline in the same ditch. Rather, the 2.9-mile segment should have been designated a loop, since it would be constructed parallel to existing pipeline to increase capacity.<sup>3</sup> Simply inserting a footnote to Table 2.1.1-1, Summary of Pipeline Facilities, stating the total pipeline length for the Stony Point to Yorktown Take-up and Relay includes a 2.9-

---

<sup>1</sup> Starting at the Stony Point Compressor Station (MP 0.0) and extending to MP 2.6 in the Town of Stony Point, the Project would replace approximately 2.6 miles of 26-inch pipeline. At MP 2.6, the 42-inch-diameter mainline pipeline would deviate from the existing right-of-way and be constructed within a new permanent right-of-way as part of the Hudson River Crossing (until MP 5.5). Between MPs 5.5 and 12.3, the existing 26-inch-diameter pipeline would be replaced with new 42-inch-diameter pipeline.

<sup>2</sup> The term “take-up and relay” refers to a construction method by which an existing pipeline is removed and replaced with a new pipeline in the same ditch. *See* Section 2.1.1 at fn. 1.

<sup>3</sup> A pipeline “loop” is a segment of pipe constructed parallel to an existing pipeline to increase capacity. *See* Section 2.1.1 at fn. 2.

mile section of new mainline pipeline within a new permanent right-of-way, does little to inform local residents and businesses about the potential impacts associated with the construction of this new pipeline segment. In fact, short of a detailed review of the DEIS, any reference to the Stony Point to Yorktown Take-up and Relay segment brings with it the incorrect inference that the entire 12.3 miles of the 42-inch-diameter mainline pipeline section consists of “take-up and relay” pipeline segments.

Based on the foregoing, SAPE requests that a revised DEIS be prepared with revised tables that analyze the 12.3-mile section from Stony Point to Yorktown in three separate sections:

- A 42-inch-diameter take-up and relay mainline pipeline from MP 0.0 to MP 2.6 in Rockland County, NY;
- A loop of new 42-inch-diameter mainline pipeline from MP 2.6 to MP 5.5 in Westchester County; and
- A 42-inch-diameter take-up and relay mainline pipeline from MP 5.5 in Cortlandt, NY to MP 12.3 in Yorktown, NY in Westchester County.

Respectfully submitted,

Susan A. Van Dolsen

PUBLIC TITLE

## CITY OF BOSTON • MASSACHUSETTS

OFFICE OF THE MAYOR  
MARTIN J. WALSH

October 24, 2014

Ms. Cheryl A. LaFleur, Chairman  
Federal Energy Regulatory Commission  
888 First Street, NE  
Washington, DC 20426

Dear Commissioner LaFleur:

I am writing with regard to the Algonquin Incremental Market Project proposed by Algonquin transmission, LLC (Algonquin). As Mayor of the City of Boston, I represent the residents of West Roxbury who are directly impacted by this project.

At a recent community meeting I held in West Roxbury sponsored by the local representatives and attended by United States Congressman Stephen F. Lynch, many issues were brought to our attention that warrant consideration as the process moves forward. Of particular concern is the danger that the proposed route of the high pressure gas pipeline presents to the densely settled residential homes in the area. Of further concern is the decision to locate the Metering and Regulating station in an area of residential homes and adjacent to an active stone quarry that engages in significant ongoing blasting activity.

As proposed, the current route which runs along Grove Street to the M&R Station at Grove and Centre Streets across the quarry is troubling. According to many of the longtime residents of the homes in the area, they regularly experience shaking and rattling with each blast from the quarry, raising legitimate worry that this is not an optimal or safe location for a high pressure gas line. While I understand the need to supply natural gas to this area, I agree with my neighbors and must oppose the current configuration based on the quality of life and public safety concerns generated by the current iteration of this project.

My office has continued to receive inquiries and hear concerns from the affected communities, especially the West Roxbury area surrounding the quarry. Those calls and concerns also include thoughtful alternatives that would allow the project to proceed under a different route and configuration. I recognize that Spectra has submitted an engineering study done by GZA. However, I respectfully request that this study be reevaluated and more thoroughly examined. In the final analysis, the route must be altered to ensure the reasonable protections sought by the residents of West Roxbury and the adjacent towns.

Thank you for your consideration on this important and time sensitive matter. If I may be of further assistance, please do not hesitate to contact me, I will make myself available.

Sincerely,

Honorable Martin J. Walsh  
Mayor, City of Boston

**ASSOCIATED  
PUBLIC FILE****FEDERAL ENERGY REGULATORY COMMISSION  
WASHINGTON, DC 20426**

CP14-96

November 6, 2014

**OFFICE OF THE CHAIRMAN**

The Honorable Nita Lowey  
U.S. House of Representatives  
222 Mamaroneck Ave., #312  
White Plains, NY 10605

Dear Congresswoman Lowey:

Thank you for your October 6, 2014, letter regarding concerns expressed by your constituents in Westchester and Rockland Counties, New York, about Algonquin Transmission, LLC's (Algonquin) Algonquin Incremental Market Project (Federal Energy Regulatory Commission's Docket No. CP14-96-000).

We are in receipt of the resolutions you reference by Westchester County, Rockland County, the City of Peekskill, and the Village of Buchanan regarding the project and the Town of Cortlandt's motion to intervene in Commission's proceeding. Your constituents have raised concerns about health and safety impacts of the project, including the potential project impacts on the Indian Point Nuclear Power Plant and cumulative impacts associated with the Algonquin Atlantic Bridge Project, Champlain Hudson Power Express Project, and the West Point Partners Transmission Project.

As you know, the Commission's draft environmental impact statement (EIS) for the project was issued on August 6, 2014, with a 45-day public comment period. The draft EIS comment period closed on September 29, 2014. You request that the Commission consider withdrawing the draft EIS and issue a supplemental draft EIS, addressing your constituents' concerns. The draft EIS discusses and evaluates all of the issues and the cumulative impacts of the projects identified by your constituents, and concludes that the project would result in some adverse impacts, most of which would be reduced to less than significant levels. Section 5 of the draft EIS also recommends a total of 42 specific mitigation measures to further reduce the project impacts.

Currently, Commission staff is preparing the final EIS, which will address all the comments received on the draft EIS, including those of your constituents. The final EIS will also include the findings of the Entergy Nuclear Operations, Inc.'s safety evaluation of the project on the Indian Point Nuclear Power Plant. The final EIS is currently scheduled for issuance on December 19, 2014, and will be noticed in the *Federal Register* and mailed to the environmental mailing list. Once the final EIS is issued, the Commission will consider its findings before making its decision on whether or not to authorize the project.

2014-00222  
J.A. - 0620

Dear Secretary Bose:

Please accept the following supplemental comments on behalf of Intervenor Stop the Algonquin Pipeline Expansion ("SAPE"), on the Draft Environmental Impact Statement ("DEIS") for the proposed Algonquin Incremental Market ("AIM") Project ("Project").

Of particular concern to SAPE members in Westchester County is the Stony Point to Yorktown Take-up and Relay. *See* Section 2.1.1.2. The Stony Point to Yorktown Take-up and Relay involves the construction of about 12.3 miles of 42-inch-diameter mainline pipeline in the Towns of Stony Point and Cortlandt (including the Hamlet of Verplanck and the Village of Buchanan), the City of Peekskill and the Town of Yorktown. The proposed take-up and relay includes two segments of replacement pipeline and one segment of pipeline construction within a new permanent right-of-way.<sup>1</sup> *See* DEIS at Section 2.1.1.2.

Notably, however, the 2.9-mile segment within a new permanent right-of-way (from MP 2.6 to MP 5.5) is not "take-up and relay" as that term is defined in the DEIS, since it does not involve the removal of existing pipeline and replacement with new pipeline in the same ditch.<sup>2</sup> Rather, the 2.9-mile segment should have been designated a loop, since it would be constructed parallel to existing pipeline to increase capacity.<sup>3</sup> Simply inserting a footnote to Table 2.1.1-1, Summary of Pipeline Facilities, stating the total pipeline length for the Stony Point to Yorktown Take-up and Relay includes a 2.9-

<sup>1</sup> Starting at the Stony Point Compressor Station (MP 0.0) and extending to MP 2.6 in the Town of Stony Point, the Project would replace approximately 2.6 miles of 26-inch pipeline. At MP 2.6, the 42-inch-diameter mainline pipeline would deviate from the existing right-of-way and be constructed within a new permanent right-of-way as part of the Hudson River Crossing (until MP 5.5). Between MPs 5.5 and 12.3, the existing 26-inch-diameter pipeline would be replaced with new 42-inch-diameter pipeline.

<sup>2</sup> The term "take-up and relay" refers to a construction method by which an existing pipeline is removed and replaced with a new pipeline in the same ditch. *See* Section 2.1.1 at fn. 1.

<sup>3</sup> A pipeline "loop" is a segment of pipe constructed parallel to an existing pipeline to increase capacity. *See* Section 2.1.1 at fn. 2.

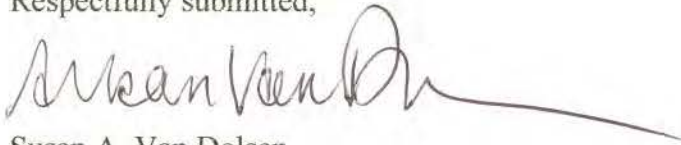

mile section of new mainline pipeline within a new permanent right-of-way, does little to inform local residents and businesses about the potential impacts associated with the construction of this new pipeline segment. In fact, short of a detailed review of the DEIS, any reference to the Stony Point to Yorktown Take-up and Relay segment brings with it the incorrect inference that the entire 12.3 miles of the 42-inch-diameter mainline pipeline section consists of "take-up and relay" pipeline segments.

Based on the foregoing, SAPE requests that a revised DEIS be prepared with revised tables that analyze the 12.3-mile section from Stony Point to Yorktown in three separate sections:

- A 42-inch-diameter take-up and relay mainline pipeline from MP 0.0 to MP 2.6 in Rockland County, NY;
- A loop of new 42-inch-diameter mainline pipeline from MP 2.6 to MP 5.5 in Westchester County; and
- A 42-inch-diameter take-up and relay mainline pipeline from MP 5.5 in Cortlandt, NY to MP 12.3 in Yorktown, NY in Westchester County.

Respectfully submitted,

A handwritten signature in dark ink, appearing to read "Susan Van Dolsen", with a long horizontal flourish extending to the right.

Susan A. Van Dolsen

Stop the Algonquin Pipeline Expansion

## 2.0 PROJECT DESCRIPTION

### 2.1 PROPOSED FACILITIES

Algonquin proposes to expand its existing natural gas transmission pipeline system in New York, Connecticut, Rhode Island, and Massachusetts. The AIM Project involves construction and operation of about 37.6 miles of replacement, loop, and lateral pipeline facilities; modifications to 6 existing compressor stations; modifications to 24 existing M&R stations; the removal of an existing M&R station; and the construction of 3 new M&R stations as described below. The Project would also involve the abandonment of one segment of existing mainline and four compressor units at one existing compressor station. An overview map of the Project locations and facilities is provided on figure 2.1-1. Detailed maps showing the pipeline routes, aboveground facilities, and pipe and contractor ware yards are contained in appendix B.

#### 2.1.1 Pipeline Facilities

The AIM Project includes about 37.6 miles of pipeline composed of the following facilities:

- replacement of 20.1 miles (in three segments) of existing 26-inch-diameter mainline pipeline with a new 42-inch-diameter pipeline (take-up and relay)<sup>1</sup>;
- extension of existing loop<sup>2</sup> pipeline with about 2.0 miles of additional 36-inch-diameter pipeline within Algonquin's existing pipeline right-of-way (Line-36A Loop Extension);
- replacement of about 9.1 miles of existing 6-inch-diameter pipeline with a new 16-inch-diameter pipeline (E-1 System Lateral Take-up and Relay);
- extension of an existing lateral loop pipeline with about 1.3 miles of additional 12-inch-diameter lateral loop pipeline within Algonquin's existing pipeline right-of-way (E-1 System Lateral Loop); and
- installation of about 5.1 miles of new lateral<sup>3</sup> pipeline off of Algonquin's existing I-4 System Lateral (West Roxbury Lateral).

Table 2.1.1-1 summarizes the proposed pipeline facilities associated with the Project.

<sup>1</sup> Take-up and relay refers to a construction method by which an existing pipeline is removed and replaced with a new pipeline in the same location and depth.

<sup>2</sup> A pipeline loop is a segment of pipe constructed parallel to an existing pipeline to increase capacity.

<sup>3</sup> A pipeline lateral branches off of a mainline pipeline to connect with or serve a specific customer or group of customers.

TABLE 2.1.1-1

## Summary of Pipeline Facilities for the AIM Project

Facility	County, State *	Existing Diameter (inches)	New/ Replacement Diameter (inches)	Begin Milepost	End Milepost	Length (miles)
<b>Replacement Pipeline</b>						
Havenstraw to Stony Point Take-up and Relay	Rockland, NY	26	42	0.0	3.3	3.3
Stony Point to Yorkdown Take-up and Relay <sup>†</sup>	Rockland, NY	26	42	0.0	3.5	3.5
	Westchester, NY	26	42	3.5	12.3	8.8
Southeast to MLV 19 Take-up and Relay	Putnam, NY	26	42	0.0	0.1	0.1
	Fairfield, CT	26	42	0.1	4.5	4.4
E-1 System Lateral Take-up and Relay	New London, CT	6	16	0.0	9.1	9.1
<b>Loop Extension</b>						
Line-36A Loop Extension	Middlesex, CT	NA	36	0.0	1.8	1.8
	Hartford, CT	NA	36	1.8	2.0	0.2
E-1 System Lateral Loop Extension	New London, CT	NA	12	0.0	1.3	1.3
<b>New Pipeline</b>						
West Roxbury Lateral	Norfolk, MA	NA	16	0.0	3.4	3.4
	Suffolk, MA	NA	16	3.4	4.2	0.8
	Suffolk, MA	NA	24	4.2	5.1	0.9
<b>TOTAL</b>						<b>37.6</b>

\* No pipeline facilities would be located in Rhode Island.

† The total pipeline length for the Stony Point to Yorkdown Take-up and Relay segment includes an approximately 2.9-mile-long section of new mainline pipeline and right-of-way associated with the crossing of the Hudson River.

## **STOP THE ALGONQUIN PIPELINE EXPANSION!**

29 Highland Rd.  
Rye, NY 10580

September 27, 2014

Kimberly D. Bose, Secretary  
Federal Energy Regulatory Commission  
888 First Street NE, Room 1  
Washington, DC 20426

**RE: Algonquin Incremental Market ("AIM") Project:  
FERC Docket No. CP14-96-000**

Dear Secretary Bose:

Please accept the following comments on behalf of Intervenors Stop the Algonquin Pipeline Expansion ("SAPE"), on the Draft Environmental Impact Statement ("DEIS") for the proposed Algonquin Incremental Market ("AIM") Project ("Project"), particularly as it affects the counties of Rockland, Westchester and Putnam in New York State. As an Intervenor in these proceedings, SAPE urges the Federal Energy Regulatory Commission ("Commission" or "FERC") to withdraw the DEIS and take no further action on the application until all of the matters set forth in these comments are addressed in a revised DEIS.

For the reasons explained below, the DEIS is inadequate as a National Environmental Policy Act ("NEPA") document and a revised DEIS must be prepared with a new period for review and public comment on the proposed project to ensure that the Commission satisfies its obligations under NEPA.

**I. The Time Period Designated to Submit Comments on the DEIS is Wholly Insufficient, Violates the Public Right to Meaningful Participation, and is Contrary to the Express Purpose of NEPA**

While SAPE appreciates the additional nine (9) days that the Commission has given to the public for comment—extending the original comment period from August 6, 2014 to September 29, 2014—a comment period of just over fifty (50) days is still wholly insufficient time to properly review the DEIS and provide substantive and useful comment given the enormity and complexity of the proposed Project. The Commission should have at least doubled the comment period for a project of this scale. The DEIS

and its exhibits total well over 1,000 pages—including appendices—and discuss complex technical and scientific information, including engineering, ecological and environmental studies and data upon which the Commission relies to justify its conclusions.

To meet the proposed Project's goals, the public should be provided appropriate time to allow for meaningful review of this lengthy DEIS with all its complexity. In that way, the public can adequately assess the study of methodologies, assumptions made and conclusions made before providing the type of meaningful comments to the Commission that NEPA expects. SAPE notes that a coalition of elected officials<sup>1</sup> recently sent a letter to the Commission requesting that the DEIS be withdrawn and a revised DEIS be released when all the missing information is complete, and that a ninety (90) day public comment period commence at that time.

Further, for many who attended the scheduled public meetings over the past week, the meetings represented the only opportunity to have their voices heard on their legitimate concerns regarding the proposed Project. The limited amount of time provided to the public for comment on the DEIS suggests that the Final EIS has already been written and that the Commission is merely going through the motions to create an illusion of meaningful public participation.

## **II. The DEIS is Grossly Incomplete and Premature**

Virtually no aspect of the DEIS is complete; its deficiencies are pervasive and substantial. Taken together they deprive the public of a meaningful opportunity to comment on the proposed plans and fail to impose enforceable mitigation prior to permitting. Significant omissions addressed in the DEIS include, but are not limited to, the following:

- Final conclusion on safety-related conflicts with the Indian Point Energy Center ("IPEC") not provided (Section 4.12.3);
- Field Sampling Plan for potential soil contamination not provided (Section 4.2.2.6);

---

<sup>11</sup> To date, the list of politicians that have signed-on to that letter requesting additional time to review and comment on the DEIS includes, but is not limited to: New York State Senator Andrea Stewart-Cousins; New York State Senator George Latimer; Assemblyman Tom Abinanti; Assemblyman David Buchwald; Assemblywoman Sandy Galef; Assemblywoman Shelley Mayer; Assemblyman Steve Otis; Westchester Legislator Catherine Borgia; Westchester Legislator Peter Harckham; Westchester Legislator Michael Kaplowitz; Westchester Legislator Catherine Parker; Westchester Legislator MaryJane Shimsky; Westchester Legislator Lyndon Williams; Putnam Legislator Carl Albano; Putnam Legislator Sam Oliverio; Rockland Legislator Harriet Cornell; Buchanan Mayor Theresa Knickerbocker; Cortlandt Town Supervisor Linda Puglisi; Peekskill Mayor Frank Catalina; Buchanan Town Board Member Duane Jackson; Cortlandt Town Board Member Debbie Costello; Cortlandt Town Board Member Seth Freach; Peekskill City Council Member Drew Claxton; Peekskill City Council Member Kathleen Talbot; Peekskill City Council Member Vinnie Vesce; North Salem Town Board Member Amy Rosmarin; Ossining Town Board Member Victoria Gearity; Yorktown Town Board Member Nick Bianco; Yorktown Town Board Member Visnu Patel.

- Insufficient analysis of impacts to vernal pools in New York (Section 4.4.3.2);
- Non-saturated wetlands not identified (Section 4.4.4);
- Compensatory Mitigation Plan not prepared (Section 4.4.5);
- Tree survey of Harriman State Park not complete (Section 4.6.1.5);
- Alternatives for the Hudson River crossing not prepared (Section 4.4.3);
- Final plans for the Catskill Aqueduct crossing not developed (Section 4.3.2.1);
- Plans for to address trench dewatering not developed (Section 4.3.2.6);
- Survey for the presence of the Indiana bat not complete (Section 4.7.1.2);
- Survey for the presence of the northern long-eared bat not complete (Section 4.7.1.3);
- Incomplete information on impacts to migratory birds (Section 4.7.2);
- Incomplete information on impact to bald eagles (Section 4.7.3);
- Survey for the presence of Timber Rattlesnakes not complete (Section 4.7.5.1);
- NYSDOS approval of consistency assessment for Hudson Crossing (Section 4.8.4.1);
- Design modifications for New York M&R stations not complete (Section 4.11.1.2);
- Site Specific construction plan for St. Patrick Church not provided (Section 4.8.5.1);
- Site Specific construction plan for Buchanan-Verplanck Elementary not provided (Section 4.8.5.1).

These omissions go to the very heart of the question of whether the proposed Project can or should be constructed. By providing a wholly incomplete DEIS for public comment, FERC has put the public and members of SAPE in an uncertain position. Undoubtedly, the permitting of this Project should not be considered further until all of the documents and information identified on the face of the DEIS are completed and made available for review and public comment. Until this occurs, the DEIS is premature and must be withdrawn.

### **III. The Project Poses A Significant Threat to Public Health and Safety.**

The transmission of highly flammable natural gas creates significant risks of loss of life and major property damage. The greatest hazard is a fire or catastrophic explosion following a major pipeline rupture. The U.S. Department of Transportation's Pipeline and Hazardous Materials Safety Administration reports that in the past 20 years alone, on-shore gas transmission incidents have caused 41 fatalities, 195 injuries requiring in-patient hospitalization and over \$1.7 billion in property damage.<sup>2</sup>

Safety is of paramount concern to SAPE members because the proposed Project plans to replace an existing 26-inch diameter pipeline with 42-inch diameter high-pressure pipelines and to add an additional 42-inch diameter high-pressure segment across the Hudson River entering a highly populated, high risk area in Cortlandt, New York in Westchester County. As a result, the Project will allow significantly greater amounts of combustible natural gas to flow through the infrastructure, thereby presenting greater risk of hazard to the public.

FERC's conclusion that the Project will have no significant environmental impacts is unsupportable where virtually no aspect of the DEIS is complete. The public has the right to know with certainty what environmental impacts of the proposed Project will be. This is particularly true where the Project raises significant health and safety concerns that have not been sufficiently addressed in the DEIS.

#### **A. Indian Point Energy Center ("IPEC") ("Indian Point")**

A site that is of particular concern to SAPE members is the Indian Point Energy Center ("IPEC") ("Indian Point") in Buchanan, New York, located in close proximity to the proposed Project route. There are three existing gas pipelines that run under the Hudson River in Algonquin's Right-of-Way and abut the IPEC security barrier. The proposed route of the new 42-inch diameter high-pressure segment would be 0.5 miles south of the existing Right-of-Way, and would cross a portion of IPEC land less than a mile from the IPEC-protected security barrier around the main facility.

Title 10 to the Code of Federal Regulations ("C.F.R.") requires that nuclear power plants be appropriately protected against the dynamic effects and conditions that may occur outside the nuclear power plant. These events include the effects of explosion of hazardous material that may be associated with nearby industrial activities such as transportation routes such as pipelines. Since the Project's proposed route passes within the confines of the IPEC site the requirements of 10 C.F.R. §100.20 should have been considered in the DEIS.

Based almost entirely on data contained in Table 4.12.3-1 ("Existing or Potential Impact Range for the AIM Project"), the DEIS concludes that the proposed Project should not pose any new safety hazards to IPEC. However, this analysis falls short of

<sup>2</sup> Stakeholder Communications, US DEPT OF TRANS PIPELINE AND HAZ SAFETY ADMIN: <http://primis.phmsa.dot.gov/comm/reports/safety/SigPSI.html?nocache+970#ngtrans>.

adequately addressing the safety-related risk of a major failure of a high-pressure natural gas pipeline in close proximity to IPEC. This failure cannot be ignored where other publicly available evaluations of natural gas pipeline hazards have concluded that a 16-inch diameter natural gas pipeline (at 50 psi) posed an undue risk to a nuclear enrichment center.<sup>3</sup> In light of these potential dangers, the proposed Project's 42-inch diameter pipeline (at 850 psi) plainly poses an unacceptable risk to IPEC.

While we are pleased that FERC has addressed its concern regarding a pipeline explosion near the IPEC facility, its analysis of the safety-related information in connection with the Project's proximity to IPEC is woefully inadequate. Notably, for example, Algonquin is still awaiting receipt of a Hazards Analysis being performed by Entergy. Without an opportunity to review that Hazards Analysis, Algonquin has not made any final conclusions with regard to the safety of its proposed pipeline in the vicinity of IPEC. The absence of final conclusions regarding potential safety-related conflicts with IPEC suggests at the very least that the proposed Project requires additional analysis. The DEIS also fails to fully consider the risk due to seismic activity in the project area and fails to fully analyze the adequacy of Algonquin's emergency response procedures to a major explosion in the vicinity of IPEC.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file its final conclusions regarding any potential safety-related conflicts with IPEC based on the Hazards Analysis currently being performed by Entergy. SAPE respectfully requests that at minimum, Algonquin must be *required* to file its final conclusions regarding those potential safety-related conflicts and that Algonquin must make all further communication regarding potential safety-related conflicts with IPEC available to the public for review and comment.

The absence of any complete information on potential safety-related conflicts with IPEC deprives the public of a meaningful opportunity to comment on the proposed Project. A Supplemental DEIS must be prepared for review and public comment to analyze potential safety-related conflicts with IPEC. *See* Section 4.12.3.

## **B. Existing/Unknown Contaminated Sites**

It is anticipated that the Project will traverse parts of New York State that are in close proximity to existing hazardous sites and facilities. In New York alone, the DEIS identifies three properties where a release of contaminants occurred and had the potential to impact soils along the proposed pipeline route.

Potential contaminants that may be encountered in soils proximate to these facilities include VOCs, petroleum hydrocarbons, polychlorinated biphenyls and other industrial chemicals. Additional soil contamination along the proposed Project route may result from hazardous material or fuel spills during construction and/or those occurring before construction in pre-existing contaminated areas. However, Algonquin has not

<sup>3</sup> *See, e.g.,* The Nuclear Regulatory Commission's 2004 hazard evaluation for the National Enrichment Facility (NEF) (Accession ML0424600718), *available online*.

even completed its inventory of locations where sampling may be necessary and has not provided details to FERC on the protocols for any such additional sampling.

Based on the foregoing, the DEIS *recommends* that prior to construction of the Project, Algonquin file a Field Sampling Plan for potentially contaminated sites that could be encountered during construction, including, but not limited to, the locations of all proposed sampling, the number of samples to be taken and how and where the samples will be analyzed. SAPE respectfully suggests that Algonquin be required to make all further communication regarding the development of its Field Sampling Plan for potentially contaminated sites in New York available to the public for review and comment.

The absence of complete information on potential soil contamination along the proposed Project route deprives the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze the Field Sampling Plan for potentially contaminated sites in New York. *See* Section 4.2.2.6.

#### **IV. The Project Will Affect Numerous Unique Areas And May Cause Destruction of Significant Environmental Resources**

An astounding number of unique resource areas will be adversely affected by the Project, which will cross through several critical environmental areas.

The proposed pipeline will cross the Hudson River, an American Heritage River, as well as Harriman State Park, the Blue Mountain Reservation, the Sylvan Glen Park Preserve, Cheesecote Mountain, the Washington-Rochambeau National Historic Trail and a Village Park in the Village of Buchanan. The proposed pipeline will cross water bodies located within sub-basin level watersheds of the Lower Hudson Watershed in Rockland, Westchester and Putnam Counties. These include crossings at the Minisceongo Creek, Cedar Pond Brook and Dickey Brook, which serve as cold- and warmwater fisheries.

The exceptional value of these unique resource areas cannot be disputed. American Heritage Rivers, including the Hudson River, are so designated because they have characteristics that render them distinctive or unique. The public lands and resources protected at the state level that will be adversely affected by the Project are no less remarkable. For example, the Haverstraw to Stony Point Take-up to Relay segment will affect approximately 15 acres of diverse forested land across a section of the Harriman and Sterling Forests in Rockland County, New York. These areas support a wide variety of flora and fauna.

## A. Wetlands & Vernal Pools

Wetlands are areas that are inundated or saturated by surface water or groundwater at a frequency and duration to support and under normal circumstances do support, a prevalence of vegetation typically adapted for live in saturated soil conditions. Wetlands are a source of significant biodiversity and serve a variety of functions including flood control, wildlife habitat, recreational opportunities, and improving water quality.

The Project will impact approximately 25 acres of wetlands and 7 vernal pools in New York State. The Project will result in 77 wetland crossings in New York alone. In particular, the Project will impact a large wetland system (B13-RLR-W3) between about MPs 0.8 and 1.0 of the Haverstraw to Stony Point Take-up and Relay segment and the 2 vernal pools in Cortlandt, New York that are located within the temporary construction area for the Project.

Project construction activities can affect wetland resources in many ways. During construction, the primary direct impact of the Project on wetlands in New York would be the short and long-term alteration of wetland vegetation. Other direct impacts associated with the Project could include changes in wetland hydrology and water quality. These disturbances could result in altered biological activities and chemical conditions that could affect the establishment of native vegetation. Secondary impacts could include reduced riparian buffers, disturbance to adjacent habitats and incremental fragmentation. Notwithstanding the identified impacts, the DEIS concludes that the Project would not result in adverse impacts on the functions of the wetlands.

Based on the foregoing, the DEIS *recommends* that prior to construction beginning in the vicinity of the 2 vernal pools in New York, Algonquin file revised site-specific crossing plans incorporating any additional avoidance or mitigation measures for the two vernal pools as required by state agencies. SAPE respectfully requests that Algonquin be *required* to make all further communication regarding site-specific crossing plans for the two vernal pools in New York available to the public for review and comment.

Algonquin's failure to provide site-specific plans with respect to the crossing of two vernal pools in New York means that the public has had no meaningful opportunity for comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze site-specific crossing plans incorporating any additional avoidance or mitigation measures for the two vernal pools in New York. *See* Section 4.4.3.2.

### 1. Non-Saturated Wetlands & Construction Right-of-Way Width

Algonquin's Erosion and Soil Control Plan ("E&SCP") stipulates that construction right-of-way width in wetlands be limited to 75 feet and that all additional

temporary work space should be located at least 50 feet from wetlands except where an alternative measures has been requested and approved by FERC.

Not surprisingly, Algonquin identified numerous areas (in Table 4.4.4-1) where it believed that the 75-foot right-of-way was insufficient to accommodate its wetland construction—and that a wider right-of-way was necessary. Without considering the full scope of the environmental impacts on these non-saturated wetlands and without providing data or methodology to support its determination the DEIS simply concludes that Algonquin's modification requests for a wider right-of-way are justified. Further, the DEIS acknowledges that Algonquin's E&SCP was not consistent with FERC Procedures with regard to construction in site-specific non-saturated wetland conditions.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file its final site-specific information regarding the location of those wetlands it believed would meet the criterion of non-saturated conditions at the time of construction. SAPE respectfully requests that Algonquin make all further information regarding the location of those wetlands it believed would meet the criterion of non-saturated conditions at the time of construction available to the public for review and comment.

Algonquin's failure to provide any site-specific information regarding the location of non-saturated wetlands in its E&SCP deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any site-specific information regarding the location of wetlands believed to meet the criterion of non-saturated conditions at the time of construction. *See* Section 4.4.4.

## **2. Compensatory Mitigation Plan**

The majority of the wetland impacts would be on PEM (Palustrine Emergent) and PSS (Palustrine Scrub-Shrub) wetlands, with only 17 acres of PFO (Palustrine Forested) wetland impacts. About 2.5 acres of PFO wetlands would be permanently converted to non-forested conditions as a result of the Project. Algonquin developed a Compensatory Mitigation Plan to provide compensatory mitigation for both temporary impacts and permanent conversion of wetlands to another cover type.

Even though the United States Army Corps of Engineers ("USACE") NY District indicated what it would require in terms of on-site restoration for temporary wetland impacts and off-site mitigation for permanent conversion, Algonquin has not yet developed any final mitigation plan. Further, Algonquin has not even confirmed New York's compensatory mitigation requirements for wetland impacts and has just assumed that the proposal submitted to the USACE NY District would be acceptable to the New York State Department of Environmental Conservation ("NYSDEC"). Notwithstanding these deficiencies, the DEIS concludes that impacts on most wetland resource would be minimal and would be temporary in duration.

Based on the foregoing, the DEIS *recommends* that prior to beginning construction in New York, Algonquin file its final Compensatory Mitigation Plan, developed in consultation with USACE and NYSDEC and file documentation of consultation with these agencies regarding the Compensatory Mitigation Plan. SAPE respectfully suggests that Algonquin must be *required* to make all further communication regarding development of its final Compensatory Mitigation Plan available to the public for review and comment.

Algonquin's failure to finalize a Compensatory Mitigation Plan deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any final Compensatory Mitigation Plan. *See* Section 4.4.5.

### **B. Harriman State Park – Site Specific Plan**

Algonquin's existing right-of-way is currently recognized as existing scrub-shrub and open field wildlife habitats used by a variety of species inhabiting Harriman State Park and Blue Mountain Reservation.

Since Project construction is expected to have impacts on wildlife species that inhabit these habitats, Algonquin met with the Palisades Interstate Park Commission ("PIPC") in January 2014 to discuss the Project's impacts on Harriman State Park. As a result of the meeting, Algonquin agreed to conduct tree counts for the portions of the Project's pipeline construction located in the park to address compensation for tree removal. Algonquin still has not completed *any* tree surveys and continues to consult with the New York State Office of Parks Recreation and Historic Preservation ("NYSOPRHP") and PIPC.

Based on the foregoing, the DEIS *recommends* that, prior to construction of the Haverstraw to Stony Point Take-up and Relay segment, Algonquin file a site-specific plan for the Harriman State Park, including any avoidance or mitigation measures developed with the NYSORPH and PIPC. SAPE respectfully suggests that Algonquin be *required* to make all further communications with NYSORPH and PIPC regarding the site-specific plan for the Harriman State Park available to the public for review and comment.

The absence of any completed tree survey of Harriman State Park deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project as currently envisioned will have on Harriman State Park. *See* Section 4.6.1.5.

### **C. St. Patrick's Church (Verplanck, New York)**

St. Patrick's Church is located in the hamlet of Verplanck, New York. The Stony Point Take-up and Relay segment of the pipeline is expected to cross church property. A

new easement would be required for this crossing as it deviates from the existing right-of-way. Without mitigation, project construction will result in significant adverse impacts to the church property. For example, the project will restrict church parking, interfere with access to the church, and result in noise and dust disturbances. Notably, however, Algonquin has not filed a site-specific construction plan for the church.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file a site-specific construction plan for the St. Patrick Church developed in consultation with church leadership. SAPE respectfully suggests that Algonquin be *required* to file its site-specific plan for the church property and to make all further communications regarding its site-specific construction plan for the St. Patrick's Church available to the public for review the public for review the public for review and comment.

The absence of any site-specific construction plan for the St. Patrick's Church deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project would have on St. Patrick Church. *See* Section 4.8.5.1.

#### **D. Buchanan-Verplanck Elementary School**

The Buchanan-Verplanck Elementary School is a public elementary school serving about 300 people in Westchester County. The Stony Point to Yorktown Take-up and Relay segment of the Project would be located adjacent to the back portion of the school property between MPs 4.9 and 5.0.

The DEIS fails to adequately analyze the potential safety-related impacts of siting a 42-inch diameter high-pressure gas pipeline in close proximity to an elementary school. However, the DEIS acknowledges that, since construction activity could potentially coincide with the school year, construction noise and dust could cause a disturbance to school operations. SAPE suggests that such disturbances are, more likely, a certainty that is unacceptable both in terms of the impact on children's health and their studies.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file a site-specific construction plan for the Buchanan-Verplanck Elementary School developed in consultation with school management. SAPE respectfully suggests that Algonquin be *required* to file its site-specific construction plan and to make all further communications regarding that site-specific construction plan for the Buchanan-Verplanck Elementary School available to the public for review and comment.

The absence of a site-specific construction plan for the Buchanan-Verplanck Elementary School deprived the public and, more to the point, the parents of affected students attending the school, of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project would have on St. Patrick Church. *See* Section 4.8.5.1.

### **E. Hudson River Crossing -- Horizontal Directional Drilling (“HDD”)**

The Hudson River is the only major water body (greater than 100 feet wide) crossed by the pipeline. Algonquin plans to use the Horizontal Directional Drilling (“HDD”) crossing method at the Hudson River in New York.

In accordance with the prescribed (Delft Geotechnics) method, Algonquin completed a hydraulic fracture evaluation for the Hudson River HDD to estimate the maximum effective pressure (*i.e.*, drilling fluid pressure) that can be induced during a HDD operation within a particular soil. The results of the evaluation suggested that there exists a relatively high potential for hydraulic fracture in the soft sediments of the Hudson River HDD alignment. Despite the high risk of hydraulic fracturing using HDD, the DEIS concluded that the HDD method was an appropriate technique for installing the pipeline at the Hudson River crossing.

While the DEIS briefly assesses alternatives to the proposed route, it does so without providing any data to support its conclusion that the proposed route is the most suitable. Notably, Algonquin has not provided the Commission with a contingency plan that incorporates another location or another construction methodology for the Hudson River crossing. If the Project proceeds as planned and the HDD proves unsuccessful, Algonquin will have no alternative location or methodology identified in connection with the proposed Project’s largest water crossing. This is unacceptable.

Algonquin’s failure to develop a contingency plan that incorporates another location or another construction methodology for the HDD crossing of the Hudson River falls short of what is required under NEPA.

Algonquin’s failure to include an alternative location or methodology for the planned Hudson River crossing deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to fully examine any alternative plan considered by Algonquin for the HDD crossing of the Hudson River. *See* Section 4.4.3.

### **F. The Catskill Aqueduct Crossing**

The proposed Stony Point to Yorktown Take-up and Relay segment crosses the Catskill Aqueduct. The Catskill Aqueduct is a part of the New York City water supply system. It brings water from the Catskill Mountains to Yonkers where it connects to other parts of the system.

As currently proposed, Algonquin would remove its existing 26” pipeline that currently crosses over the aqueduct and replace those removed section(s) with 42-inch diameter pipeline. Remarkably, however, Algonquin has still not finalized its planned crossing of the Catskill Aqueduct and is still in consultation with NYCDEP regarding the crossing and evaluating an alternative route that would relocate the segment to the south.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file a site-specific crossing plan for the Catskill Aqueduct developed in consultation with the NYCDEP, containing the location relative to the aqueduct, the construction methods, timing of construction and any mitigation measures to minimize impacts. SAPE respectfully suggests that Algonquin be *required* to file its site-specific crossing plan for the Catskill Aqueduct and to make all further communication regarding the development of a site-specific crossing plan for the Catskill Aqueduct developed in consultation with the NYCDEP available to the public for review and comment.

Algonquin's failure to finalize its planned crossing of the Catskill Aqueduct deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to fully examine the extent of any impacts of the planned Catskill Aqueduct crossing. *See* Section 4.3.2.1.

### **G. Trench Dewatering**

Project construction activities could negatively affect water resources in many ways. During construction, open trenches may accumulate water, either from seepage or drainage. Where dewatering becomes necessary, the water would be removed and directed into well-vegetated uplands. However, Algonquin's Erosion and Soil Control Plan ("E&SCP") does not address the need to isolate shorter portions of trench to reduce the volume of water handled at one time.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file additional details describing how it would minimize trench dewatering as recommended by the NYSDEC and file documentation of its consultations with NYSDEC. SAPE respectfully suggests that Algonquin be *required* to file a report setting forth such additional details and to make all further communication regarding trench dewatering developed in consultation with the NYCDEC available to the public for review and comment.

Algonquin's failure to fully address trench dewatering and the need to isolate shorter portions of trench to reduce the volume of water handled at one time in its E&SCP deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project would have on trench dewatering. *See* Section 4.3.2.6.

## **V. State of New York Parkland Alienation**

The proposed Project will intrude onto parkland in the State of New York, including the Blue Mountain Reservation, the Sylvan Glen Park Reserve (note: Granite Knolls West is incorrectly considered the same as Sylvan Glen Park Reserve in the DEIS and they are not the same), Cheesecote Mountain and a Village Park in the Village of Buchanan.

New York law is well settled: dedicated park areas in New York are impressed with a public trust for the benefit of the people of the State. That proposition is reflected both in New York case law and in New York statutes. The leading New York decision on this issue is *Williams v. Gallatin*, 229 N.Y. 248 (1920), in which the Court of Appeals held that legislative approval is required when there is a substantial intrusion on parkland for non-park purposes. This requirement, moreover, exists regardless of whether there has been an outright conveyance of title and regardless of whether the parkland is ultimately to be restored. Since *Williams*, New York courts have reaffirmed the principle that parkland is impressed with a public trust, requiring legislative approval before it can be alienated or used for an extended period for non-park purposes.

Notwithstanding the still-binding legal precedent requiring legislative authorization, the Commission takes the opposite position: that the proposed Project would fall within recognized “*de minimis*” exceptions to the rule. Yet the cases cited by the Commission in support of its position are distinguishable from the facts here, in that each of those cases involved land that was found *not* to be parkland.

Respectfully, SAPE believes that the proposed Project as currently envisioned does not fall within any recognized *de minimis* exception and that the proposed Project requires legislative approval for its intrusions onto New York state parkland. In any case, the issue is not one for the parties or the Commission to decide; only a court can properly make such determination in accord with *Williams* and its progeny. See Section 4.8.5.1.

## **VI. The Project Will Have Cumulatively Significant Impacts on the Environment**

NEPA mandates that a proper EIS include a full discussion of the cumulative impacts of a proposed project. See 40 C.F.R. §1508.25(a)(2); *Kleppe v. Sierra Club*, 427 U.S. 390, 413 (1976) (“Cumulative environmental impacts are, indeed, what require a comprehensive impact statement”). An EIS must include the cumulative effects of projects if those projects are “interrelated and functionally interdependent” to the proposed action. *Stewart v. Potts*, 996 F.Supp. 668, 683 (S.D. Texas 1998). Courts have been very clear that projects must be evaluated together whenever “proceeding with one project, will, because of functional or economic dependence, foreclose options or irretrievably commit resources to future projects. *Fritiofson v. Alexander*, 772 F.2d 1225, 1241 n. 10 (5<sup>th</sup> Cir. 1985). Under 40 C.F.R. §1508.7, cumulative impacts are defined as:

the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

The DEIS’s treatment of cumulative impact falls short of NEPA requirements. The DEIS fails to consider the full scope of impacts. It also assesses the identified impacts without providing any detailed or quantified data to support the analysis.

Finally, the DEIS impermissibly relies entirely on presumed compliance with permitting requirements and mitigation plans to justify its conclusion that most of the adverse impacts environmental impacts associated with the Project would be reduced to less than significant levels.

Although it includes a small section on cumulative impacts, the DEIS failed to consider the cumulative environmental impacts associated with the planned Atlantic Bridge Project and the Access Northeast Project. Remarkably, the DEIS failed to even mention the Access Northeast Project. Since the AIM Project, the Atlantic Bridge Project and the Access Northeast Project are connected actions and thus “interrelated and functionally interdependent,” the present DEIS does not suffice to analyze their cumulative effects. *Stewart*, 996 F.Supp. at 683.

The DEIS represents that “three types of projects (past, present and reasonably foreseeable projects) could potentially contribute to a cumulative impact when considered with the proposed AIM Project.” However, the DEIS fails to consider the full scope of connected and similar actions as well as the cumulative impacts arising from the full scope of those actions. *See* Section 4.4.3.2.

## **VII. The DEIS Improperly Segments the AIM Project from Connected Actions**

One of the DEIS’s principle deficiencies is that it improperly segmented the AIM Project from other connected actions which are part of Spectra/Algonquin’s larger development plan to expand its existing pipeline system. Segmentation is a means of circumventing NEPA’s purpose by dividing a larger action into smaller proposed actions, thereby minimizing the environmental consequences of a larger plan by dividing it into several proposals for analysis in separate NEPA documents. *See Citizens’ Comm. to Save Our Canyons v. U.S. Forest Serv.*, 297 F.3d 1012, 1028 (10<sup>th</sup> Cir. 2002).

Indeed, Algonquin and its parent company, Spectra Energy, plan to modify other parts of its existing interstate pipeline system in expansions known as the Atlantic Bridge Project and the Access Northeast Project. While no formal applications have yet been filed, the DEIS acknowledges that the Atlantic Bridge Project would be similar in scope to the AIM Project and would involve facilities in the same region of influence. Nevertheless, the DEIS fails to consider the cumulative impacts of the Atlantic Bridge Project since it would “not occur at the same time” as the AIM Project and its details were unknown.

Remarkably, the DEIS makes no reference whatsoever to the Access Northeast Project, a \$3 billion dollar Spectra project that would expand the existing Algonquin pipeline from New Jersey through New York and Connecticut to Everett, outside of Boston. The Access Northeast Project is specifically intended to complement the AIM and Atlantic Bridge projects and would reportedly boost capacity on Spectra’s Algonquin (and Maritimes) pipelines by as much as 1 billion cubic feet a day, by installing new larger diameter pipelines on existing routes. FERC’s failure to analyze the Atlantic

Bridge Project and the Access Northeast Project as connected actions raises serious questions about the adequacy of the DEIS's cumulative impacts analysis.

As explained below, the Atlantic Bridge Project and the Access Northeast Project are clearly connected to the AIM Project, and thus must be reviewed, pursuant to NEPA, in the same EIS, particularly with regard to potential cumulative effects associated with the several projects. *See* 40 C.F.R. §1508.25(a).

To determine whether the AIM Project has been improperly segmented, the proper inquiry is whether the Atlantic Bridge Project and the Access Northeast Project are connected for the purposes of NEPA. Under 40 C.F.R. 1508.25(a)(1), actions are connected, meaning that they must be analyzed under the same EIS, if they:

- i) Automatically trigger other actions which may require environmental impact statements;
- ii) Cannot or will not proceed unless other actions are taken previously or simultaneously; or
- iii) Are interdependent parts of a larger action and depend on the larger action for their justification.

The purpose for the rule against segmentation is to “prevent an agency from dividing a project into multiple actions, each of which individually has an insignificant environmental impact, *but which collectively have a substantial impact.*” *Wilderness Workshop v. BLM*, 531 F.3d 1220, 1228(10th Cir. 2008) (emphasis added); *Great Basin Mine Watch v. Hankins*, 456 F.3d 955, 969 (9th Cir. 2006). In other words, the rule prevents applicants and agencies from thwarting their NEPA obligations by improperly segmenting projects into smaller components in order to avoid considering their collective impact.

Under this definition, the AIM Project, the Atlantic Bridge Project and the Access Northeast Project are plainly connected actions that must be considered together under the same EIS. The primary collective purpose of these interdependent projects is to increase Spectra/Algonquin's existing pipeline capacity and to provide it access to growing natural gas supply and demand markets.

The fact that there is no formal application currently filed by Algonquin for the Atlantic Bridge Project or the Access Northeast Project should not preclude a finding that the NEPA process was unlawfully segmented. Algonquin should not be allowed to circumvent heightened environmental scrutiny by timing its applications to FERC in an effort to manipulate the NEPA process to avoid a cumulative impact analysis of its larger development plans.

In short, we believe that the AIM Project is a wholly arbitrary subdivision of a larger development project, apparently created for the purpose of thwarting NEPA review of the cumulative effects of the project in its entirety. The DEIS fails to evaluate the AIM Project in conjunction with the Atlantic Bridge Project and the Access Northeast Project even though the three projects are clearly connected and will unavoidably create a

greater cumulative effect than might be anticipated by a focused or limited review of any one of the interrelated segments.

In *Delaware Riverkeeper Network v. FERC*, No. 13-1015 (D.C. Cir. 2014), the D.C. Circuit recently applied NEPA's segmentation policy to a pipeline project. Giving considerable deference to the applicable NEPA regulations on segmentation (40 C.F.R. §1508.25), requiring federal agencies to consider the effect of "connected actions" and "similar actions" when carrying out their responsibilities under NEPA, the Court found that where four upgrades were "physically, functionally and financially connected and interdependent," they warranted a single NEPA analysis. We suggest that this analysis should be applied to the Project.

In light of the foregoing, we question why FERC would allow the AIM Project, the Atlantic Bridge Project and the Access Northeast Project to be submitted in a piecemeal fashion without a full analysis of their cumulative impacts. We urge FERC to reevaluate Spectra/Algonquin's overarching development plans to markedly expand its existing pipeline infrastructure in New York, Connecticut, Rhode Island and Massachusetts. By omitting from the DEIS any substantive discussion of the Atlantic Bridge Project and the Access Northeast Project, FERC has effectively failed to take into account the cumulative impacts of connected projects, and has thus acted contrary to NEPA and thwarted effective review by segmenting the AIM Project.

By failing to consider the Atlantic Bridge Project and the Access Northeast Project as interdependent pieces of Spectra/Algonquin's larger development plan to expand its existing pipeline infrastructure, FERC facilitated the unlawful segmentation of the AIM project.

The DEIS's failure to consider the cumulative impacts of the Atlantic Bridge and Access Northeast projects is not cured by its cursory treatment of twelve (12) other existing or proposed projects evaluated for potential cumulative impacts analysis. Notably, the DEIS fails to provide any substantive information about the additive impacts of those actions, and instead only provides brief descriptions of the actions in Table 4.13-1. Yet the information in Table 4.13-1 fails to provide anything substantive about the projects listed or any meaningful analysis of their potential for cumulative impacts.

As a result, the DEIS is inadequate in considering the combined environmental impacts of related existing and reasonably foreseeable pipelines within the Commission's jurisdiction, and a new EIS must be prepared that includes an analysis of the cumulative impacts of those projects, including the Atlantic Bridge Project and the Access Northeast Project.

#### **A. Marcellus Shale – Natural Gas Development**

Remarkably, the DEIS fails to address the effect of the Project together with the existing or reasonable foreseeable gas development activities, most notably hydraulic fracturing that has already been determined to have impacts on seismic activity. Instead, the DEIS omits any substantive discussion of foreseeable gas development, concluding

that the resources that may be affected by shale development would not be affected by the Project and the Project would not be affected by the development in the shale region.

On its face, this conflicts with NEPA policy and federal regulation, which require an analysis of the full range of a project's impacts "whether direct, indirect, or cumulative." (40 C.F.R. 1508.8). Under NEPA, indirect impacts are defined as those that occur "later in time or farther removed in distance" and may include

...growth inducing effects and other effects related to induced changes in the pattern of land use ... and related effects on air and water and other natural systems, including ecosystems. (40 C.F.R. §1508.8).

Despite this definition, the DEIS fails to address the indirect impacts of induced gas development, specifically the extent to which the presence of the proposed Project will encourage and facilitate the development of natural gas infrastructure. The DEIS also fails to consider how environmental impacts of the proposed Project may be cumulated with the impacts of gas development in the Marcellus shale region. FERC incorrectly limits its analysis to short- and long-term impacts resulting from construction of the proposed Project, ignoring the potential for future induced development of related infrastructure in New York.

Natural gas development in and around the pipeline's service area, extending into the Marcellus shale region, is a reasonably foreseeable consequence of the Project, and its effects must be considered as cumulative impacts. To the extent the DEIS considers Marcellus Shale activities, however, it fails to provide any quantified or detailed account of such activities, or consider their cumulative impacts.

While the DEIS includes a general acknowledgement that the Commission received numerous comments during the scoping for the Project about the cumulative impacts of natural gas development (including hydraulic fracturing) in the Marcellus shale region, it simply concludes, without discussion, that the local resources affected by natural gas development activities would not be affected by the Project since they would occur more than ten miles from the Project construction area, outside the sub-watersheds crossed by the Project, and outside the air quality control regions for the Project compressor stations.

The absence of any meaningful analysis in the DEIS regarding the cumulative impacts of natural gas development failed to take the requisite hard look at the environmental impacts of the proposed Project. A revised DEIS must be prepared to detail and analyze the cumulative impacts of natural gas development (including hydraulic fracturing) in the Marcellus shale region, including impacts from other reasonably foreseeable activities such as the construction of additional pipeline, access roads, compressor stations and other infrastructure. *See* Section 4.13

## **VIII. The Project May Adversely Affect Several Endangered and Threatened Species and Their Habitat**

The U.S. Fish and Wildlife Service (“FWS”) identified seven federally listed threatened or endangered species that are known to be present in the Project area. For three of the seven species identified (the Indiana bat, Northern long-eared bat and New England Cottontail) the DEIS cited incomplete survey results. For surveys that do exist for the remaining species, the DEIS fails to describe the methodology used or to identify or analyze any data. Further, the DEIS repeatedly recognizes the loss of habitat or changes to other vegetation but fails to carefully examine the impact of those losses on endangered and threatened species.

### **A. Indiana Bat**

The inadequacy of survey results is particularly apparent for the Indiana bat, a federally listed endangered species that may be impacted by the Project. Notably, the FWS identified a section of the Stony Point to Yorktown Take-up and Relay segment as having the potential to provide suitable summer habitat for the Indiana bat. Yet despite the likely presence of Indiana bats in the Project area, Algonquin has still not completed any survey of the area for bats.

While the DEIS states that Algonquin is in consultations with the FWS to *plan* surveys and develop and implement mitigation measures, the fact that there is still no complete survey of the Project in regard to this endangered species is astounding. Further, the DEIS fails to provide any meaningful analysis of the potential for habitat destruction. The incomplete survey results, lack of habitat destruction analysis and the lack of any suggested avoidance or mitigation measures, clearly demonstrate that the DEIS is inadequate.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file all survey results, any avoidance or mitigation measures developed in consultation with the FWS and a statement regarding Algonquin’s intent to comply with those measures.

FERC’s framing here as a mere “recommendation” what should be a necessary precondition casts doubt on whether measures to mitigate harms to the species in the project area will ever be undertaken. Although a segment of the Project has been identified as having the potential to provide suitable summer habitat for the Indiana bat, FERC has not received complete survey results, nor has it sufficiently addressed habitat destruction or mitigation measures to justify approval of this Project at this time. SAPE respectfully requests that Algonquin make all further communication regarding the Indiana bat developed in consultation with the FWS available to the public for review and comment.

Algonquin’s failure to have any completed survey of the Project area for the presence of the Indiana bat deprived the public of a meaningful opportunity to comment

on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project would have on the Indiana bat. *See* Section 4.7.1.2.

### **B. Bog Turtle**

The bog turtle is a federally listed threatened turtle that is potentially present within the Project area. Based on information from the FWS, bog turtles could be present in suitable wetlands along the proposed Southeast to MLV 19 Take-up and Relay segment in Putnam County, New York. Notably, consultation with the FWS identified a known bog turtle habitat within sixteen (16) miles of the proposed Project facilities in New York.

Although Algonquin completed surveys for bog turtles and identified a known bog turtle habitat in the vicinity of the Project area, the DEIS simply concludes without explanation that the Project would not likely affect the bog turtle.

Algonquin's failure to adequately explain its methodology in reaching a determination that bog turtles would not likely be affected by the Project deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project would have on the bog turtle. *See* Section 4.7.1.2.

### **C. Northern Long-eared bat**

The northern long-eared bat, currently proposed for federal listing as an endangered species, may be impacted by the Project. Yet despite the possibility that Northern Long-eared bats are present in the Project area, Algonquin has still not completed any survey of the area.

While the DEIS states that Algonquin will be conducting surveys in connection with this species at the same time as the surveys it plans for the Indiana bat (see above), the incomplete results clearly demonstrate that the DEIS is inadequate.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file its survey results, any avoidance or mitigation measures developed in consultation with the FWS and a statement regarding Algonquin's intent to comply with those measures.

FERC's framing here as a "recommendation" what should be a necessary precondition casts doubt on whether measures to mitigate harms to the species in the project area will ever be undertaken and if so, whether such measures will be effectively designed. Although Algonquin continues to consult with the FWS to assess the potential occurrence of the Northern long-eared bat in the Project area, FERC has not received complete survey results, nor has it sufficiently addressed habitat destruction or mitigation measures to justify approval of this Project at this time. SAPE respectfully suggests that

Algonquin be *required* to make all further communication regarding the Northern long-eared bat developed in consultation with the FWS available to the public for review and comment.

Algonquin's failure to have any survey completed of the Project area for the presence of the northern long-eared bat deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project would have on the northern long-eared bat. *See* Section 4.7.1.3.

#### **D. Migratory Birds**

Potential impacts of the Project on migratory birds, including FWS Birds of Conservation Concern (BCC)-listed birds, would include temporary and permanent loss of habitat associated with the removal of existing vegetation during construction. Noise and other construction activities could also potentially affect foraging and breeding activities that occur during the nesting season. Migratory birds could also be affected by the operation and maintenance of the new facilities, including a reduction in habitat, potential increase in parasitic bird species, edge effects and ongoing disturbances associated with maintenance.

The Haverstraw to Stony Point Take-up and Relay segment of the Project as currently envisioned runs adjacent to and across the section of the Harriman and Sterling Forests' Important Bird Area (IBA) in Rockland County, New York. This diverse forested area supports a healthy representative breeding community of migratory birds which may be potentially harmed or disturbed by impacts associated with the Project, including tree removal and construction related disturbances.

While the DEIS outlines mitigation measures for Algonquin to implement to potentially minimize the proposed Project's impact on migratory birds, it states that the FWS is still reviewing the AIM Project for migratory bird impacts, and Algonquin is still in consultations with the FWS and NYSDEC. The absence of complete information as to the potential impacts of the Project on migratory birds demonstrates that the DEIS is incomplete.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file any updated consultations with the FWS Field Office in New York regarding migratory birds including and avoidance measures developed.

FERC's framing here as a "recommendation" what should be a necessary precondition casts doubt on whether effective measures to mitigate harms to the species in the project area will ever be undertaken. Although Algonquin continues to consult to assess the potential impact on migratory birds in the Project area, FERC has not received complete survey results, nor has it sufficiently addressed habitat destruction or mitigation measures to justify approval of this Project at this time. SAPE respectfully suggests that

Algonquin be *required* to make any further communication regarding migratory birds developed in consultation with the FWS available to the public for review and comment.

The absence of any final assessment by the FWS regarding the potential impact of the Project on migratory birds deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project would have on migratory birds. *See* Section 4.7.2.

### **E. Bald Eagles**

As of March 2013, adult and immature bald eagles were observed flying along the shorelines and hillsides of the Hudson River and an active nest was observed less than 3 miles from the Project. However, the DEIS does not include any substantive analysis of the impacts the Project would have on bald eagle habitats.

While the DEIS states that Algonquin is in consultation with the FWS and NYSDEC to discuss survey results and to develop and implement appropriate avoidance and mitigation measures to avoid impacts on bald eagles in the Project area, the absence of complete information on the bald eagle suggests that the DEIS is inadequate.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin file any updated consultations with the FWS and NYSDEC regarding bald eagles including and avoidance measures developed.

FERC's framing here as a "recommendation" what should be a necessary precondition casts doubt on whether measures to mitigate harms to the species in the project area will ever be undertaken. Although Algonquin continues its consultation to assess the potential impacts on bald eagles in the Project area, FERC has not received complete survey results, nor has it sufficiently addressed habitat destruction or mitigation measures to justify approval of this Project at this time. SAPE respectfully requests that Algonquin make any further communication regarding bald eagles developed in consultation with the FWS or NYSDEC available to the public for review and comment.

Algonquin's failure to assess the potential impacts on bald eagles in the Project area deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project would have on bald eagles. *See* Section 4.7.3.

### **F. Timber Rattlesnakes**

The timber rattlesnake is a state-listed threatened species that inhabits deciduous forest in rugged terrain. According to NYSDEC, timber rattlesnakes are known to be present along the Stony Point to Yorktown Take-up and Relay segment of the Project. Possible impacts to the timber rattlesnake include alteration of forested habitat and direct impacts including mortality. Since Algonquin would not be able to adhere to NYSDEC's

seasonal restrictions for timber rattlesnakes, the DEIS outlined additional measures to be implemented by Algonquin to mitigate impacts to rattlesnakes.

Yet despite the likely presence of timber rattlesnakes along the Project area, Algonquin has still not completed its survey for snakes or performed any included any analysis of habitat destruction.

While the DEIS states that Algonquin is engaged in consultation with the NYSDEC to identify potential existing habitats in construction work areas in Rockland County and determine proper mitigation measures, the fact that there is still no complete survey of the Project in regard to this state-listed threatened species is disturbing. In addition, the DEIS fails to provide any meaningful analysis of the potential for any habitat destruction.

Based on the foregoing, the DEIS *recommends* that Algonquin file any results for timber rattlesnakes habitat, permit requirements, and avoidance or mitigation measures developed in consultation with the FWS and NYSDEC regarding timber rattlesnakes.

FERC's framing here as a "recommendation" what should be a necessary precondition casts doubt on whether measures to mitigate harms to the species in the project area will ever be undertaken. Although Algonquin continues to consult to assess the potential impacts on timber rattlesnakes in the Project area, FERC has not received complete survey results, nor has it sufficiently addressed habitat destruction or mitigation measures to justify approval of this Project at this time. SAPE requests that Algonquin make any further communication regarding timber rattlesnakes developed in consultation with the FWS or NYSDEC available to the public for review and comment.

Algonquin's failure to have any survey completed of the Project area for the presence of timber rattlesnakes deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze any potential impact that the Project would have on timber rattlesnakes. *See* Section 4.7.5.1.

## **G. Coastal Zone Management**

The Stony-Point to Yorktown Take-up and Relay segment crosses the coastal zone management area associated with the Hudson River in the Town of Stony Point and in the City of Peekskill. The Project plans to cross the Hudson River using the HDD method to avoid impacts on aquatic resource and potential impacts on critical environmental areas.

Algonquin filed its consistency assessment application with the New York State Department of State ("NYSDOS") in February 2014 describing how the Project would be consistent with state coastal policies as well as policies of the town approved waterfront revitalization programs. To date, however, NYSDOS has yet to approve Algonquin's consistency assessment application.

Since NYSDOS has not yet concurred with Algonquin's consistency assessment application, the DEIS fails to address whether or not the Project would or would not be consistent with the above mentioned coastal zone management policies to justify approval of this Project at this time.

Based on the foregoing, the DEIS *recommends* that Algonquin file documentation of concurrence from the NYSDOS that the Hudson River crossing is consistent with New York coastal policies, including the Stony Point and Peekskill waterfront revitalization plans. SAPE requests that Algonquin be *required* to make any further communication regarding concurrence from the NYSDOS that the Hudson River crossing is consistent with New York coastal policies available to the public for review and comment.

Algonquin's failure to have its consistency assessment application approved by NYSDOS deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze whether or not the proposed Project's Hudson River crossing is consistent with New York coastal policies. *See* Section 4.8.4.1.

## **IX. Analysis of Air Quality and Climate Change Impacts is Inadequate**

As discussed below, the DEIS dramatically underestimates the extent to which Project construction and operation will emit air pollutants and fails to present a comprehensive analysis of the direct, indirect and cumulative effects of the Project on air quality.

The DEIS acknowledges that construction and operation of the proposed Project will result in significant emissions of various air pollutants, including NO<sub>x</sub>, VOCs, carbon monoxide, particulate matter, sulfur dioxide and GHGs. These pollutants affect air quality—and therefore human health—in a variety of ways. NO<sub>x</sub> is a precursor of both ozone and fine particulate matter. VOCs are also an ozone precursor. Fine particulate matter is linked to increased heart attacks, aggravated asthma and decreased lung function, and for people with heart or lung disease, premature death. Ozone exposure can lead to coughing, chest pain and throat irritation. It also exacerbates pre-existing bronchitis, emphysema and asthma and can reduce lung function.

With the exception of sections exploring whether air emissions trigger regulatory requirements, the DEIS does not undertake any analysis of the potential impacts on those who may be at risk of exposure to the HAPs. FERC's failure to undertake any meaningful analysis of the effects of emissions from Project construction and operation is particularly concerning, given that the proposed Project would result in significant emissions of NO<sub>x</sub> and VOCs. *See* Section 4.4.3.2.

### **A. Compressor Stations / M&R Stations**

The compressor stations in New York are already major sources of Hazardous Air Pollutants (HAPs). Peer-reviewed scientific studies indicate that emissions from

compressor stations and other shale gas infrastructure are associated with negative health impacts. Current emissions will be significantly increased by the expansion of the Southeast and Stony Point compressor stations, and the region including Putnam, Rockland and Westchester counties is already considered a non-attainment zone for air quality standards according to the United States Environmental Protection Agency (USEPA).

Submissions made by Algonquin (Resource Report #9 in Docket CP12-96-000) do not reflect the aggregate (existing or proposed) and cumulative emissions from compressor stations, metering stations and pipelines for the Project. In addition, modifications are needed to the M&R stations in Peekskill, Cortlandt and Stony Point, New York, to connect the existing valve to the new 42-inch diameter pipeline. However, the design modifications are still not complete.

Without considering any proposed design modification to the M&R stations, the DEIS largely dismisses the impacts of air pollution, and concludes that modeling analysis for all modeled pollutants would not contribute to a violation of the National Ambient Air Quality Standards (NAAQS). Since Algonquin's M&R design modifications are not yet complete, the DEIS could not have addressed the unknown.

Based on the foregoing, the DEIS *recommends* that prior to the end of the DEIS comment period, Algonquin provide an update regarding the air permitting requirements associated with the modification to the M&R stations in New York, as well as any application filed with NYSDEC regarding air permitting/registration. SAPE requests that Algonquin be *required* to provide its update requiring the air permitting requirements and that it be further *required* to make any further communication regarding the air permitting requirements associated with the modification to the M&R stations in New York available to the public for review and comment.

The absence of any completed design modifications for the M&R stations in New York deprived the public of a meaningful opportunity to comment on the proposed Project. A revised DEIS must be prepared for review and public comment to analyze the final design modifications for the M&R stations in New York. *See* Section 4.11.1.2.

## **B. Fugitive Emissions**

The DEIS fails to adequately address fugitive emissions from the proposed Project. The DEIS provides an annual estimate of these emissions in Table 4.11.1-13, but that table fails to provide any basis for those estimates. In particular, the DEIS provides no analysis of potential malfunctions of either pipeline or compressors that could lead to unintended emissions of various HAPs. This is a significant oversight, given that the PHMSA reported *nearly 300 significant pipeline incidents* in 2013. The data makes clear that spills, explosions and other unintended releases of pollutants from pipelines occur with a measurable degree of frequency. The resulting—and equally predictable—emissions should be taken into account as part of the DEIS's assessment of the impacts associated with the Project.

The DEIS's failure to adequately address fugitive emissions from the proposed Project and further, its failure to provide any data or methodology to support its conclusion, deprived the public of a meaningful opportunity to comment on the proposed Project and failed to take the requisite hard look at the proposed Project's environmental impact. A revised DEIS must be prepared for review and public comment to adequately address fugitive emissions from the proposed Project. *See* Section 4.11.1.3.

### **C. Cumulative Impacts on Air Quality**

As discussed *supra*, the DEIS's analysis of cumulative impacts of the proposed Projects on air quality is insufficient. The DEIS concedes that the construction and operation of the Project will contribute cumulatively to air quality impacts, but concludes that it does not anticipate that the construction and operation of the proposed Project facilities will have a significant impact on air quality. Although it is unclear exactly to what extent the DEIS has calculated the potential emissions from other projects and included them in its cumulative impact analysis, the DEIS nonetheless discounts the impacts of those projects without offering any justification for such discounting of those dangers.

The DEIS's failure to adequately address the cumulative impacts of the proposed Projects on air quality deprived the public of a meaningful opportunity to comment on the proposed Project. Moreover, the DEIS failed to take the requisite hard look at the proposed Project's environmental impact. A revised DEIS must be prepared for review and public comment to adequately address the cumulative impacts of the proposed Projects on air quality. *See* Section 4.13.7.

### **D. Climate Change**

The DEIS fails to undertake a meaningful analysis of the climate change impacts of GHG emissions, including fugitive GHG emissions, which would result from the construction and operation of the Project. The DEIS concludes, without pointing to any evidence in support of its conclusion, that emission of GHGs from the proposed Project would not have any direct impacts on the climate change in the Project area. As discussed *supra*, this conclusion fails to take into account the likelihood of a significant incident with the pipeline, resulting in a spill, leak, explosion or other unintended emission of GHGs.

The absence of any meaningful analysis of the climate change impacts of GHG emissions associated with this Project deprived the public of a meaningful opportunity to comment on the proposed Project. The DEIS, moreover, failed to take the requisite hard look at the proposed Project's environmental impact. A revised DEIS must be prepared for review and public comment to analyze the climate change impacts of GHG emissions associated with this Project. *See* Section 4.13.8.

## VII. Environmental Justice

In New York, environmental justice communities are defined according to the following thresholds: communities where 23.6 percent of the individuals within a given census block are living below the poverty line as low-income populations; and/or communities where minorities comprise more than 51.1 percent of the population within a given census block as minority populations. Low income communities and communities of color have historically been overburdened as a result of air pollution from energy-generating facilities. In particular, the proposed Project would have adverse impacts on neighborhoods within a 12.5-mile radius of downtown Peekskill, New York, an area that is already home to more than its fair share of hazardous waste facilities.

The primary adverse impacts on the environmental justice communities associated with the construction of the Project would be the temporary increases in dust, noise and traffic from the Project construction. These adverse impacts would occur along the entire pipeline route. However, the DEIS does not provide sufficient financial analysis of the Project to effectively determine if the Project would result in a disproportionately high and adverse impact on these minority and low-income populations.

Other than acknowledging that two census block groups crossed by the Project in Westchester County have minority populations greater than the minority threshold, the DEIS lacks any meaningful analysis of environmental justice issues. The lack of any discussion of the costs of the Project, including a full analysis of the discarded alternatives, prevents any meaningful understanding of the impact upon environmental justice communities.

The absence of any meaningful analysis in the DEIS of the proposed Project's impact on environmental justice issues along the pipeline route failed to take the requisite hard look at the proposed Project's environmental impact. A revised DEIS must be prepared for review and public comment to analyze the impact on environmental justice issues along the pipeline route. *See* Section 4.9.10.

## CONCLUSION

For all of the reasons stated above, the DEIS is premature, incomplete, unsupported by evidence and fails to adequately consider the direct, indirect and cumulative impacts of the proposed Project. The proposed Project is unnecessary, improperly located in close proximity to a nuclear power facility, with significant environmental impacts that have not been fully addressed in the DEIS. The defects in the DEIS are fundamental and pervasive. We therefore request that the Commission: (1) take no further action with respect to permitting of the proposed Project on the basis of this profoundly flawed DEIS; and (2) prepare a revised DEIS with a new period for review and public comment to ensure that the FERC satisfies its obligations under NEPA.

Respectfully submitted,

Stop the Algonquin Pipeline Extension (SAPE)

**Docket #CP14-96-000**

**November 17, 2014**

**Chairwoman LaFleur,**

Thank you for your response to the joint request of myself and nine of my Boston City Council colleagues regarding the need for a Supplemental Draft Environmental Impact Study. I write to you today to notify you of a troubling misstatement in Spectra's latest communication to FERC.

In a letter dated October 31, 2014, Spectra stated that, "Numerous discussions with Boston Mayor Martin Walsh's office as well as the Boston City Council, including City Councilors Matt O'Malley and Michelle Wu, occurred over the summer and into the fall." I would like to note for the record, that the only time I met with and discussed the West Roxbury Lateral with representatives from Spectra was at a small community meeting on October 2, 2014, to which I had been invited by community residents. A member of my staff attended two other meetings, one sponsored by Spectra on September 3, 2014 and the other sponsored by FERC on September 8, 2014, but I was not present.

It is critical that information being sent to FERC and posted to the public docket is accurate, and it is my hope that the record will be corrected to properly reflect my communications with Spectra throughout this process.

I would like to further note my continued opposition to this proposal due to Spectra's failure to be forthright with the community throughout this process.

Sincerely,

**Michelle Wu**

**Re: FERC Proceeding CP14-96: Algonquin Gas Transmission, LLC Algonquin  
Incremental Market ("AIM") Project**

Dear Ms. Bose:

Enclosed for filing please find the report of Accufacts, Inc. prepared on behalf of the Town of Cortlandt, commenting on the Draft Environmental Impact Statement for the AIM Project. Exhibits 4 and 5 of the report refer to Critical Energy Infrastructure Information ("CEII") materials. Consistent with FERC's eFiling guidelines, we are filing both a public copy of the report from which Exhibits 4 and 5 have been redacted and, under seal, a full copy including Exhibits 4 and 5.

Please contact me if you require any additional information.

Sincerely,

Daniel Mach

**Re: Review of Algonquin Gas Transmission LLC’s Algonquin Incremental Market (“AIM Project”), Impacting the Town of Cortlandt, NY, FERC Docket No. CP14-96-0000, Increasing System Capacity from 2.6 Billion Cubic Feet (Bcf/d) to 2.93 Bcf/d**

### **Executive Summary**

Accufacts Inc. was retained by the Town of Cortlandt (“Cortlandt”) to perform a basic system review and to provide a brief analysis of the above FERC filing as it may affect Cortlandt. The project as submitted to FERC is asking for several major modifications on the Algonquin gas transmission system to increase gas capacity by approximately 342 dekatherms per day (Dth/d) from Ramapo, NY, to move gas eastward to Connecticut, Rhode Island and Massachusetts markets. The AIM proposal impacting Cortlandt upgrades the existing 26-inch and 30-inch looped pipelines between the Stony Point and the Southeast Compressor Stations in New York, by removing sections of existing 26-inch lower 674 psig Maximum Allowable Operating Pressure (“MAOP”) pipe, replacing it with approximately 8 miles of new 42-inch higher 850 psig MAOP pipe, and installing new interconnecting pressure reducing/letdown valves to take advantage of the higher MAOP pipe (See Exhibit 1).<sup>1, 2, 3</sup> A segment of the new 42-inch installation may also involve approximately 2 miles of pipe looped on new right-of-way (“ROW”) running south of the Indian Point nuclear power plant complex within Cortlandt. Modifications to a metering and regulating station servicing the Cortlandt, NY area are also

---

<sup>1</sup> Looping is the connection of two or more pipes between two points, splitting gas flow to reduce pressure drop through the connected sections of the pipeline due to pressure limitations or for increasing the flow rate in a bottlenecked or constrained segment or section.

<sup>2</sup> MAOP is a term defined in federal minimum pipeline safety regulations that defines the maximum pressure under which a gas pipeline may normally be operated. Pressures greater than MAOP are allowed in certain situations.

<sup>3</sup> There are varying numbers in AIM Project filings to FERC for the miles of pipe replacement within Cortlandt. The 8 mile figure is derived from Exhibit G data.

included in the project. This report focuses on the gas transmission infrastructure that could impact Cortlandt.

The following are major findings and observations from my analysis of the AIM Project proposal, sections of the AIM DEIS, and a detailed review of CEII information supplied in the Exhibit Gs submitted to FERC by Algonquin that contain important system information.<sup>4</sup> Exhibits 4 and 5, which are included as attachments, contain more detailed information bolstering my general observations and findings, but these two specific Exhibits are CEII protected under a nondisclosure agreement (“NDA”), and are not for public release or distribution, even among Cortlandt officials, unless they have also signed a FERC CEII NDA.

### **Major Accufacts Findings and Observations for Cortlandt concerning the AIM Project:**

- 1) The new 42-inch pipeline in Cortlandt is considerably oversized/overbuilt for the stated capacity increase of 342 Dth/d claimed for this project.
- 2) Actual gas velocities, an important variable driving design, for the pre-AIM existing gas transmission pipelines spanning Cortlandt are within acceptable ranges, but after the AIM installation are so low that considerable future possible throughput increases can be easily accommodated for these segments.
- 3) Further Algonquin Pipeline pipe expansions in New York State are likely given the 42-inch pipe installations proposed for AIM, and the extremely high gas velocities in other existing segments of the New York system further downstream of Cortlandt. However, the AIM proposal and the DEIS contain no evaluation of the impacts of these future expansions.
- 4) The Safety Evaluation and Analysis for the Indian Point Nuclear Plant (“IPEC”) submitted by Entergy concerning the risk associated with the 42-inch AIM pipeline is seriously deficient and inadequate.
- 5) Additional precautions are warranted for the proposed southern 42-inch pipeline route near the Buchanan-Verplanck Elementary school.

Expanding on the above major findings and observations:

- 1) The new 42-inch pipeline in Cortlandt is considerably oversized/overbuilt for the stated capacity increase of 342 Dth/d claimed for this project.**

The following Exhibits included as Attachments supplement this report:

- 1) Exhibit 1 is a simple schematic developed from information in the public domain of the existing and proposed major pipeline segments for the AIM Project that could impact

---

<sup>4</sup> Accufacts requested the CEII information from FERC on September 11, 2014 and received the files from Algonquin on October 6, 2014.

Cortlandt. The AIM Project is proposing to modify the pipeline segments between the Stony Point and Southeast Compressor Stations into two significantly different operating loops via new mainline interconnects utilizing pressure reducing/letdown valving installations, and various pig launcher/receiver modifications (to be installed within Cortlandt) to produce: (a) a “Smaller Loop” mainline system consisting of first an existing 30-inch pipeline reducing to an already existing 26-inch mainline, and (b) a “Larger Loop” mainline system consisting of new proposed 42-inch pipe reducing down to an already existing downstream 30-inch mainline (See Exhibit 1).<sup>5</sup>

- 2) Exhibit 2 is a figure captured from the AIM Project DEIS showing the relative location of where the existing 26-inch pipeline will be removed and replaced by new 42-inch pipeline that AIM has labeled “Take-up and Relay (T&R),” in essentially the same right-of-way (“ROW”) through most of Cortlandt.<sup>6</sup>
- 3) Exhibit 3 is a figure taken from the AIM DEIS depicting existing and proposed Algonquin Hudson River crossings for the AIM Project.<sup>7</sup>
- 4) Exhibit 4 (CEII Protected) is a hydraulic profile (pipeline pressure vs. pipeline milepost) developed by Accufacts for the smaller diameter (30-inch and 26-inch) lower MAOP pipeline (Smaller Loop) segment within New York State, pre and post AIM Project, for the pipelines between the Stony Point and Southeast compressor stations, incorporating Exhibit G information provided by Algonquin’s submission to FERC.
- 5) Exhibit 5 (CEII Protected) is a hydraulic profile developed by Accufacts for the larger diameter (42-inch and 30-inch) higher MAOP pipeline (Larger Loop) segment within New York State, pre- and post-AIM Project, for the pipelines between the Stony Point and Southeast compressor stations, incorporating the Exhibit G information provided by Algonquin’s submission to FERC.

Exhibits 1, 2, and 3 provide a quick perspective of the pipeline changes and general routing for the AIM Project in that specific segment of concern between the compressor stations that bridge Cortlandt. Exhibits 4 and 5 provide a more detailed technical perspective of some of the hydraulics (pressures, MAOP, and gas velocities at certain locations along the pipelines) for the flow cases that drive various Accufacts conclusions and findings. For ease of reference in Exhibit 4 and 5, I have set the milepost (“MP”) reference for the segments beginning at the Stony Point, NY compressor station at zero. The pipelines crossing Cortlandt generally begin at the landfall on the east side of the Hudson River, and are thus

---

<sup>5</sup> Pig launcher/receivers are above ground installations to permit the periodic launching or receiving, depending on their location within the system, of multi-ton inline inspection tools inserted into an operating transmission pipeline to assess for various pipeline imperfections, or certain possible threats, to pipeline integrity.

<sup>6</sup> Algonquin Gas Transmission LLC Docket No. CP14-96-000, FERC/EIS-0254D, “Algonquin Incremental Market Project Draft Environmental Impact Statement,” filed to the FERC Docket on 8/6/14, p. 2-2.

<sup>7</sup> *Ibid.*, p. 3-20.

between approximately MP 3.5 and 11.5 as indicated on Exhibits 4 and 5. Exhibit 4 contains an approximately 5 mile shorter length for the Smaller Loop between compressor stations post versus pre AIM, which Accufacts cannot explain from the Exhibit G data provided. This discrepancy suggests an error in this important submission to FERC. This difference does not affect Accufacts' major findings or conclusions, however.

In addition, I have reviewed the Hudson River crossing DEIS discussions currently consisting of: two existing 24-inch pipelines, and an existing 30-inch pipeline, and a proposed new 42-inch pipeline crossing to be routed either south of the existing three gas pipeline river crossings or at a more northern crossing (the Hudson River Northern Route Alternative, or "HRNRA") near the existing three pipelines (See Exhibit 3).<sup>8</sup> This new 42-inch Hudson River crossing, to be installed via Horizontal Directional Drill, or HDD, if possible, would connect to new onshore 42-inch pipelines installed on each side of the Hudson River as part of AIM. The southern 42-inch crossing option would incorporate a new additional pipeline right-of-way of approximately 1 3/4 miles within Cortlandt as it is routed out of the existing pipeline ROW and south of the Indian Point Energy Complex passing a church and an elementary school. The route eventually rejoins the existing 26-inch ROW east of IPEC to continue its route through Cortlandt in the existing ROW as indicated in Exhibit 3 filed to the FERC Docket on August 6, 2014 as the Draft Environmental Impact Statement, or DEIS.

A detailed review of the CEII files captured by the hydraulic profile in Exhibit 5 clearly demonstrates the 42-inch pipeline is not needed for the AIM project claimed capacity increases of 342 Dth/d. The Larger Loop is taking considerable pressure drop introduced from a new "midstream" mainline pressure reducing/letdown valve located at the end of the new pipe MAOP 42-inch upgrade at the edge of Cortlandt, essentially wasting horsepower added at the Stony Point compressor station (See Exhibits 1 and 5). The 42-inch proposal overbuilds the system for the capacity/horsepower increases submitted for AIM. The Stony Point Compressor station after the AIM project, fails on both the Larger Loop and Smaller Loop mainline systems to operate anywhere near Stony Point Compressor Station discharge pipeline MAOP, and the 42-inch to 30-inch mainline pressure reducing/letdown valve takes a major pressure drop for the stated maximum flow conditions.<sup>9</sup> This indicates that added AIM horsepower is wasted at the Stony Point Compressor station increasing pollution emissions.

Exhibit 5 can also be used to demonstrate that a new smaller (i.e., 30 or 36-inch 850 psig MAOP pipe instead of the proposed 42-inch) can provide the additional 342 Dth/d claimed in the AIM proposal. Installation of higher rated MAOP pipe on the discharge segment of Stony Point Compressor Station deals with one bottleneck on this segment spanning the compressor stations. AIM is incomplete, however, as it fails to also adequately address the

---

<sup>8</sup> The proposed installation of the 42-inch across the Hudson River and south of Indian Point is in a new ROW within the Town of Cordlandt. The existing two, 24-inch and one, 30-inch crossings under the Hudson River will remain active and pressurized, in "standby" backup service if ever needed, which is a reasonable operating approach for this river crossing.

<sup>9</sup> For the Exhibit G CEII cases reviewed, the Smaller Loop does not take pressure drop at the new pressure reducing/letdown valve to stay within the 26-inch mainline MAOP.

weaker bottleneck mainline segments downstream of Cortlandt entering the Southeast Compressor Station that are experiencing extremely high actual gas velocities.

Installation of the overbuilt/oversized AIM 42-inch pipe appears to be an initial effort by Algonquin to minimize future construction impacts by installing a pipeline larger than that needed for the present stated application, but positions the system for future major increased expansions. This is especially true if further downstream pipeline “bottlenecks” to the Southeast Compressor Station can be overcome with additional pipe replacements/upgrades to reduce the extreme actual gas velocities in these remaining existing mainline pipes.

The AIM Project is clearly oversized and is only a partial step toward a more system-wide pipe upgrade path within the state of New York. The AIM Project thus appears to be either an unjustified pipeline expansion or a segmentation of a larger, system-wide upgrade. The AIM Project effort is substituting quicker-to-install compressor horsepower placed at Stony Point against additional needed pipe replacement. Such a quicker path may be an attempt to avoid a proper environmental review and introduces a substantial loss of pipeline system efficiency via wasted horsepower and subsequent increased air pollution emissions. This inefficiency is not addressed in AIM’s DEIS.

**2) Actual gas velocities, an important variable driving design, for the existing gas transmission pipelines spanning Cortlandt are within acceptable ranges, and after the AIM installation are so low that considerable future possible throughput increases can be easily accommodated for these segments.**

For a natural gas transmission pipeline a critical variable, actual gas velocities (in ft/sec, or fps) along the system, is very relevant, usually driving piping mainline modification/addition decisions and compressor horsepower installations. Actual gas velocities within a pipeline segment are mainly a function of:

1. the internal pipeline diameter,
2. the required gas flow along a given pipeline segment, usually reported at standard flow conditions,
3. pipeline pressure, which decreases and varies down a pipeline, and
4. pipe segment MAOP.<sup>10</sup>

Because natural gas is compressible as pressure decreases along a pipeline, actual gas velocities increase for the same cross-sectional area of the pipe and same gas flow stated at standard conditions. Gas flow as stated at standard conditions of temperature and pressure can vary depending on possible major additions and takeoffs along a specific pipeline segment, though many segments do not have major receipts or deliveries. Because the pressure at the downstream segment is less than the upstream pressure, actual mainline velocity is usually (but not always, depending on such factors as receipts/deliveries) highest for pipeline segments immediately upstream of compressor stations (at lowest segment

---

<sup>10</sup> There is an associated effect of gas temperature on gas velocity but this influence in long transmission pipelines is usually not leveraging.

pressure). High gas velocities can also be experienced in segments where the effective cross sectional area of a pipeline, or looped pipelines, is restricted or “pinched,” compared to the rest of the segments experiencing similar standard flows and pressures.

Accufacts has observed that maximum actual gas velocities along a specific pipeline have usually been set by company internal standards that keep velocities well below those that could result in mainline erosion and based on other considerations. As a result, federal minimum pipeline safety regulations have not established maximum gas velocities for gas transmission pipelines. Unfortunately, Accufacts has found that more than one company has elected to change, ignore, or modify their own internal maximum historical gas velocity standards in recent FERC filings in order to minimize project costs and/or accelerate applications/approvals with FERC and project startup on multibillion dollar expansion projects. For example, I place little credence in studies or industry standards submitted to FERC that try to convey that a maximum gas velocity of 100 fps is appropriate for gas transmission pipelines.<sup>11</sup> For many reasons, including close proximity to population areas, gas transmission velocities should be set at limits well below those of production pipelines.

For gas transmission pipelines, two cases are usually important in actual gas velocity determinations: the velocities at “design” capacity, and the velocities at “peak flow” which will usually be higher than the design case. These two terms are often not defined in a FERC process and their misuse or misapplication can have serious consequences on safe and appropriate operation of a gas transmission pipeline.

Peak flow cases and their probable duration usually establish the maximum actual gas velocity design control within a transmission pipeline segment, as well as the needed additional horsepower and pipeline operating pressure, but this should be confirmed by the development of a hydraulic profile (pipeline operating pressure vs milepost) of the boundary case incorporating the gas additions and removals along a pipeline system that may differ between the cases. Peak flow cases usually set the maximum operating pressure which can affect a safety design review within a pipeline segment, but not always. The information provided in Exhibit Gs usually permits one to develop such a simple hydraulic profile as that captured in Exhibits 4 and 5. Fortunately, the Exhibit Gs and supporting documents for the AIM Project provided under CEII Nondisclosure Agreements provided sufficient relevant details to reliably evaluate this system at important points where actual gas velocities may be critical for the AIM Project and provide an indication where pipeline bottlenecks remain for possible future capacity increases.

A detailed analysis of the information provided under FERC CEII nondisclosure and Algonquin NDA agreements has allowed Accufacts to develop the hydraulic profiles of Exhibits 4 and 5.<sup>12</sup> Further, Accufacts’ calculations based on this CEII protected data

---

<sup>11</sup> Accufacts Report to Delaware Riverkeeper, “Evaluation of Actual Velocity Critical Issues Related to Transco’s Leidy Expansion Project,” dated Sept 8, 2014 (FERC Docket No. CP13-551, Accession No. 20140910-5084 submitted 9/10/2014).

<sup>12</sup> Accufacts was required to take a highly unusual step of signing an Algonquin NDA, which raises serious questions about the CEII process in this FERC filing.

indicate that actual gas velocities do not exceed prudent velocities in the pipeline segments spanning Cortlandt for both the AIM base and expansion cases. In fact, the resulting very low gas velocities for these segments after AIM suggest the pipelines crossing Cortlandt will be able to easily accommodate considerable future expansions via horsepower increases at the Stony Point compressor station.

- 3) Further Algonquin Pipeline pipe expansions in New York State are likely given the 42-inch pipe installations proposed for AIM, and the extremely high gas velocities in other existing segments of the New York system further downstream of Cortlandt. However, the AIM proposal and the DEIS contain no evaluation of the impacts of these future expansions.**

While the gas transmission pipelines crossing Cortlandt for the CEII cases reviewed indicate actual gas velocities well within acceptable ranges, this is not the case for much of the existing looped pipelines remaining downstream of Cortlandt but upstream of the Southeast Compressor Station in New York. Actual gas velocities on these existing 26 and 30-inch downstream transmission pipelines are at the highest levels that Accufacts has observed in the many FERC CEII filings we have been asked to review (well beyond 60 feet per second). Such high gas velocities suggest further pipe replacement projects in the Algonquin system in New York are needed or forthcoming. Such additional expansions should not be segmented in phases, but should be considered as one overall project requiring a complete environmental review considering their cumulative environmental impact. FERC needs to pursue this important possible segmentation question in further detail.

Because of gas compressibility, pipeline segments facing high gas velocities from increased demand can reduce velocities by increasing compressor horsepower with one or a combination of the following approaches: (1) increase system operating pressure subject to the MAOP limitations of the pipe, (2) rerate or uprate the segment of the pipe MAOP following certain pipeline safety minimum regulations for such upgrades that can introduce some serious risks unless a proper integrity hydrotest is performed, (3) replace or loop the pipeline usually with higher MAOP rated pipe, to yield a larger effective diameter for the segment, and/or (4) shorten the interval between compressor stations by adding new compressor stations that essentially raise the system average operating pressure.

While the 42-inch take and replace segments (42-inch to replace portions of the existing 26-inch) overcompensate for basically the upstream half of the looped system between Stony Point and Southeast Compressor Stations within New York, the remaining existing looped New York pipeline systems downstream of Cortlandt are a serious impediment given inefficiencies of the looped remaining pipeline system both in limited pipe diameter and low MAOP. I would anticipate further 26-inch pipe replacement proposals on this segment downstream of Cortlandt and upstream of the Southeast Compressor Station in the near future that take full advantage of additional capacity of the 42-inch proposed installation applied for in this Docket. Commensurate with such an additional pipe segment upgrading will most likely be a need for additional compressor horsepower at Stony Point.

**4) The Entergy-submitted Safety Evaluation and Analysis for the Indian Point Nuclear Plant (“IPEC”) concerning the risk associated with the 42-inch AIM pipeline is seriously deficient and inadequate.<sup>13</sup>**

After a careful review, Accufacts has concluded that the above referenced Entergy Safety Evaluation and Analysis (“Analysis”), which includes enhanced pipeline measures proposed by the pipeline operator for the 42-inch pipe segment near IPEC fails to adequately capture the threat and, more importantly, prudently demonstrate that rupture of the new 42-inch higher MAOP pipeline will not markedly impact IPEC facilities, including IPEC’s ability to “failsafe” shutdown from such a pipeline rupture. A 42-inch pipeline rupture is a far greater release event than that from the existing 26- or 30-inch lower MAOP gas transmission pipelines now operating in close proximity to IPEC.

A primary deficiency in the Analysis is the critical assumption of a three minute response time to identify, acknowledge, and close appropriate gas mainline remote isolation valves in event of a pipeline rupture. This assumption is unrealistically optimistic, ignoring both systemic dynamics (compressor and pipeline system rupture dynamics/interactions that mask remote rupture identification), uncertainty in the SCADA monitoring that will further delay remote recognition of a pipeline rupture, and control room operator confusion and related human factors that will also easily further delay control room remote response actions of a pipeline rupture, all of which will work to drive response well beyond the assumed 3 minute time. In addition, the 3 minute assumption disregards initial release and subsequent blowdown times dictated by the laws of thermodynamics related to pipeline rupture, even large 42-inch gas transmission pipelines. History is filled with clear examples of gas transmission pipeline rupture events generating high heat flux events well past an hour, so the 3-minute response assumption in the Analysis is highly unrealistic and not appropriate for this sensitive infrastructure site, especially with a 42-inch high MAOP pipeline. Such important issues must be taken into consideration in any prudent and realistic safety analysis concerning critical energy infrastructure, such as a nuclear power plant, where gas transmission pipeline rupture interactions, such as loss of nearby power grid or substations and resulting loss of power to IPEC, may cascade or snowball, driving the nearby IPEC facility to failure or prevent emergency access.

The Analysis has identified that in the vicinity of IPEC the 42-inch pipeline will be enhanced, or upgraded, to consist of X-70 API 5L grade pipe with a thicker wall thickness of 0.72 inches, buried to a minimum depth of four feet.<sup>14</sup> While I approve of these specific proposed safety enhancement measures to increase the 42-inch pipeline safety near IPEC, additional arguments presented in the Analysis are very misleading or inappropriate so as to cause one to underrepresent the real risks of pipeline rupture on/near IPEC, even with the enhancements. These additional arguments are far from complete in preventing a pipeline

---

<sup>13</sup> Entergy letter to U.S. Nuclear Regulatory Commission, “10 C.F.R 50.59 Safety Evaluation and Supporting Analysis Prepared in Response to the Algonquin Incremental Market Natural Gas Project Indian Point Nuclear Generating Unit Nos. 2 & # Docket Nos. 5-247 and 50-286 License Nos. DPR-26 and DPR-64,” dated August 21, 2014.

<sup>14</sup> *Ibid.*, Sheets 3 to Sheet 10 of 21.

rupture. For example, the argument to install a concrete barrier over the pipeline to prevent possible damage from third parties at first blush sounds like an appropriate step. Unfortunately, Accufacts has seen too many pipeline near misses where such barriers were defeated, negating the effectiveness of such barriers to avoid serious damage to high-pressure pipelines. Accufacts has yet to see a steel pipeline that cannot be damaged by third party threat activities, especially damage that could result in delayed pipeline rupture. I have seen similar misguided arguments presented in the Analysis that steel pipelines can be made difficult to puncture, reflected in some very poor pipeline risk management approach studies and safety risk analyses trying to improperly convey the impression that pipelines cannot be made to rupture. Delayed pipeline ruptures generating massive explosions and flames are caused by damage that seldom punctures the pipe, but the pipe is weakened to where it eventually fails in time as a rupture, a large pipeline fracture that occurs in microseconds during operation.

The Analysis should more thoroughly assess the impact of pipeline rupture on IPEC facilities and operation. Such a safety hazard analysis is unique to the IPEC facilities and should thoroughly evaluate and document a process safety management approach to assess the real effect on IPEC of the proposed 42-inch, 850 MAOP, gas transmission if it should rupture. Given the seriousness of a nuclear plant loss-of-containment incident, that analysis should reflect actual gas rupture dynamics and realistic duration and impact for this specific location and system. Such an analysis should be performed and subjected to a true independent process hazard analysis that would assure any equipment loss impacted by such a large diameter pipeline rupture would not prevent the “failsafe” shutdown of IPEC, nor loss of radiation storage containment that could cascade into a radiation release in this highly populated and sensitive location. Risk management analysis should be considered seriously deficient if it dismisses low probability events with catastrophic consequences as no probability. History has repeatedly demonstrated that when it comes to complex systems, low probability events can easily become linked, substantially increasing the likelihood and risks, and may even drive a system to catastrophic failure with all too predictable disastrous consequences. A more thorough and truly independent safety analysis of the 42-inch pipeline and its possible rupture effects to IPEC are warranted and the results made public given the deficiencies and many failings of the current Analysis to instill confidence in the public.

**5) Additional precautions are warranted for the proposed southern 42-inch pipeline route near the Buchanan-Verplanck Elementary school.**

Given the various concerns raised from involved officials and citizens about the risks associated with the southern routing option of the new 42-inch proposed pipeline in close proximity to the Buchanan-Verplanck Elementary School, Accufacts will comment on pipeline related safety concerns concerning this matter. Ironically, current federal pipeline minimum safety regulations, industry codes, or best practices, do not specifically or adequately address siting issues or risks related to natural gas pipelines near schools. Pipeline safety regulations are moot concerning such important siting related issues for various reasons.

Nevertheless, there are several precautions that Accufacts recommends that would prove helpful to minimize the consequences of a 42-inch pipeline rupture if the new pipeline is routed in such a sensitive location near the school. There is no requirement that a pipeline be placed in an existing or new ROW, or even in the middle of a pipeline ROW. The placement of the pipeline right-of-way and the actual location of the pipeline within the ROW should be carefully reviewed and assured so as to minimize the removal of trees that buffer between the proposed pipeline and the school. Such large and numerous trees can reduce the impact of blast and thermal radiation to structures and individuals, buying critical time that can markedly reduce injury or loss of life associated with a possible pipeline rupture. In addition the Buchanan-Verplanck Elementary School is constructed mostly of masonry that has a much greater tolerance, or survivability, during a rupture event. Such more hardened structures also serve as excellent radiation shields to shelter individuals from blast and thermal radiation. While there is no requirement, placement of school ball and play fields where individuals are most likely to be caught unsheltered, are best situated as presently located, in the shadow of the building away from the gas transmission pipeline. Sheltering substantially increasing the likelihood of individual survival should a pipeline rupture.

The stark reality is that pipeline safety regulations and industry standards do not provide FERC with siting precautions for such sensitive locations. Integrity management (“IM”) pipeline safety regulations have attempted to instill certain additional safety precautions in such potential High Consequence Areas, or HCAs. Unfortunately, the first phase of these IM regulations, in effect for more than ten years now, have met with very mixed success as evidenced by many high profile pipeline ruptures indicating further improvements in IM regulation are warranted.<sup>15</sup>

## Conclusion

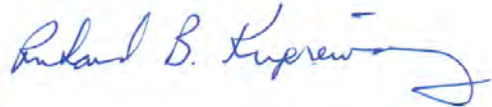

It should be clear, from a review of the Exhibits and the above discussions, that the attempt to replace segments of the 26-inch pipeline segment with a 42-inch pipeline across Cortlandt are not in sync with the claimed increased gas demands identified in the current AIM FERC filing and subsequent DEIS. The operator appears to be positioning for further expansions on the Algonquin system and there are still serious bottlenecks on the looped system between the Stony Point and Southeast Compressor Stations that should have been included with this FERC application. The operator appears to be attempting to utilize horsepower compressor additions that can be permitted more quickly than pipe installations, in an attempt to overcome pipeline bottleneck inefficiencies in remaining segments spanning New York State.

Accufacts cannot overstress the importance of performing a full and complete process hazard safety analysis, independently demonstrating, especially to the public, that there will be no interplay between a possible gas transmission pipeline rupture and the IPEC facilities to failsafe shutdown or cause a loss of radiation containment in such a sensitive and highly populated area

---

<sup>15</sup> Sites where significant numbers of people can gather near a pipeline, such as churches and schools, fall under the definition of High Consequence Areas, meriting additional pipeline safety integrity management precautions as per Subpart O of 49CFR§192 for gas transmission pipelines.

of the country. A proper and thorough hazard review and analysis may suggest another 42-inch route is warranted to assure the safety of IPEC from this gas transmission pipeline infrastructure. While Accufacts can appreciate attempts to keep certain information of such an important safety analysis somewhat secret, much more detailed effort is needed to assure the public that prudent and complete safety analysis efforts have been performed in choosing possible pipeline options in this location.

**THE COMMONWEALTH OF MASSACHUSETTS  
ENERGY FACILITIES SITING BOARD**

ONE SOUTH STATION  
BOSTON, MA 02110  
(617) 305-3525

DEVAL L. PATRICK  
GOVERNOR

November 24, 2014

Kimberly D. Bose, Secretary  
Federal Regulatory Energy Commission  
888 First Street, N.E.  
Washington, DC 20426

Re: Algonquin Gas Transmission, LLC, Docket No. CP14-96-000

Dear Ms. Bose:

On September 29, 2014, the Massachusetts Energy Facilities Siting Board (the "Siting Board" or "Board") submitted comments to FERC regarding the Draft Environmental Impact Statement ("DEIR") filed in this case. Since that time, additional residents have brought their concerns to the Board's attention. Consequently, the Siting Board hereby submits this letter and its enclosures as a supplemental comment letter on the Algonquin Incremental Project ("AIM"). This letter and its enclosures do not primarily address the DEIR. Rather, this letter and its enclosures address the AIM project as a whole.

On or about October 8, 2014, Ms. Rickie Harvey, a resident of West Roxbury, Massachusetts, acting with a group of residents, West Roxbury Saves Energy ("WRSE"), propounded written questions to the Algonquin regarding AIM. As you may be aware, the AIM project involves locating natural gas pipeline in West Roxbury, a densely-populated residential section of Boston. While Algonquin did respond in writing to these questions, WRSE and Ms. Harvey are dissatisfied with the responses. On November 16, 2014, they sent an email to Algonquin's local counsel, Jon Bonsall, Esq. of Keegan Werlin LLP, articulating the specific faults they allege in the responses. A copy of the email was sent to me last week.

Attached is a document that I have created using the written correspondence exchanged by the parties. The enclosed document contains: the questions propounded to Algonquin by Ms. Harvey and WRSE; Algonquin's responses to those questions; and Ms. Harvey's criticisms of those responses. The various parts of these documents have been cut and pasted in order to group the questions, answers, and criticisms by subject matter.

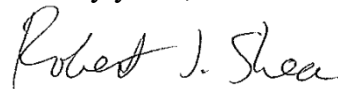

Please note, the questions propounded by Ms. Harvey and WRSE to Algonquin are printed in bold. The Company's response is printed in regular, black typeface. Ms. Harvey's criticisms of the responses follow those responses. These criticisms are printed in blue. The

criticisms are all taken from the November 16, 2014 email. The text from that email that addresses an overall dissatisfaction is printed at the beginning of the enclosed document, also in blue. Ms. Harvey's closing comments are printed, in blue, at the end of the document.

You will note that the questions propounded to Algonquin are grouped together and responded to as a group. It was Algonquin that so arranged the questions and responses. I have kept this arrangement in the enclosed document to avoid confusion.

We hope that this letter and the enclosed document are helpful to FERC. Thank you for accepting this letter and the enclosed document as supplements to the Board's earlier comments.

Sincerely yours,

Robert J. Shea  
Attorney, Massachusetts Energy  
Facilities Siting Board

Enclosure

Jon N. Bonsall, Esq. (w/enclosure, by email only)  
Ms. Rickie Harvey (w/enclosure, by email only)

## **THE EXCHANGE OF CORRESPONDENCE BETWEEN WEST ROXBURY SAVES ENERGY AND ALGONQUIN GAS TRANSMISSION LLC, ARRANGED BY SUBJECT MATTER.**

Text from Ms. Harvey's email to Jon Bonsall, Esq. dated November 16, 2014

Mr. Bonsall,

Thank you for forwarding Spectra/Algonquin's responses to the questions from our Community Meeting on Oct. 8 that you did not attend. It was a disappointment that multiple questions were grouped together and then answered that way. They were individual questions from individuals in the community and deserved individual answers. While this may have helped Spectra organize the questions, it also made it easy to fail to provide a great deal of specific information that we requested. If Spectra either cannot or will not provide the specific answers to our questions, we should be told this.

I forwarded Spectra's responses to the community, and following are reactions and comments. Please also see, at the conclusion, a question and a comment about Spectra's recent filings on FERC's website in response to FERC's request for more information.

[Editor's note: The reactions and comments by Ms. Harvey to the Algonquin responses are printed in blue.]

### **I. QUESTIONS 4-7, 13 AND 16**

- A. Questions Propounded to Algonquin by Ms. Harvey and WRSE. These questions were grouped together by Algonquin. The "Safety" headline was also supplied by Algonquin)

### **Safety**

**4. What safety precautions will be taken to avoid an explosion at any point in the line? 5. What activities and events are likely to cause an explosion along the line or at the M&R Station? What is Spectra doing to prevent such events from occurring? 6. Knowing that promising with 100% certainty that no event will occur that results in a major explosion is not possible, what percent are you able to promise? What is your SLO (service level objective) for safety? 7. What kind of pressure can the pipes withstand before they are compromised and at risk for an explosion or other catastrophe? 13. On page 5-14 of the DEIS the mention of a "slight increase in risk to the nearby public" of the new pipeline is stated. What are these "slight" risks? 16. Describe what occurs when a 750 psi pipe has an explosion.**

- B. Algonquin's Response

- General Pipeline Safety Information

Since pipeline safety is a concern raised in many of these questions, the following is information about interstate natural gas transmission pipelines and how they are safely designed, constructed, operated and maintained. This includes the pipeline system operated by Algonquin Gas Transmission, LLC (“Algonquin”). It is also important to note that the Draft Environmental Impact Statement (the “DEIS”) which the Federal Energy Regulatory Commission (“FERC”) issued on August 6<sup>th</sup> concluded that Algonquin’s implementation of the safety measures which are reflected in its filing and reviewed within the DEIS would ensure public safety and the integrity of its proposed facilities. FERC also noted that Algonquin’s facilities will be designed, constructed, operated and maintained in accordance with or to exceed the applicable federal regulations which are intended to ensure adequate protection for the public and to prevent natural gas facility accidents and failures. Accordingly, FERC determined that by designing its project in accordance with the applicable standards, Algonquin’s West Roxbury Lateral Project would not result in significant increased public safety risk. FERC’s DEIS also noted that its regulations require that an applicant certify that it will design, install, inspect, test, construct, operate, replace, and maintain the facilities for which a Certificate is requested in accordance with federal safety standards and plans for maintenance and inspection. FERC also stated that natural gas transmission pipelines continue to be a safe, reliable means of energy transportation. Please also refer to the copy of Resource Report 11 concerning reliability and safety which accompanied Algonquin’s FERC application and which is attached to these responses.

The pipeline is designed, constructed and operated to last virtually forever with the proper ongoing maintenance practices. Natural gas transmission pipelines have been operating safely in New England for over 60 years.

The pipeline is built of high strength carbon steel that is coated with a corrosion resistant, non-conductive, inert material with high quality control during manufacturing. The pipe is coated with corrosion resistance coatings. During construction, each joint of pipeline is welded and each weld is x-rayed to verify its integrity. Additionally, the pipeline is hydrostatically tested at high pressure before being placed into service to ensure its structural integrity prior to being placed into service. During hydrostatic testing, the pipeline is filled with water and pressurized to at least 150 percent of the maximum allowable operating pressure. That pressure is held for a minimum of 8 hours to confirm the integrity of the pipeline. The pipeline is also cathodically protected to protect it from the effects of corrosion.

The pipeline will consist of high strength Grade X-52 steel with welded connections. The pipe will be installed within an excavation and be enveloped in an engineered backfill (e.g., compacted sand or cementitious fill (a.k.a., flowable fill)) extending a minimum of 8 inches below the pipe and a minimum of 6 inches on both sides and the top of the pipe. The engineered backfill is designed to support the pipe evenly, and protect the pipe’s corrosion-protection coating.

Once the pipeline is installed at least three feet beneath the surface and the surface is restored to its pre-existing contours, Algonquin installs above-ground or surface markers to indicate the location of the buried pipeline. These markers are placed in line-of-sight intervals as the buried pipeline crosses private and public property; they are also installed at each and every road crossing. Markers are designed to enhance public safety and alert anyone planning any

excavation activities of the pipeline's presence in the area. The markers contain a decal which indicates Algonquin's name and the telephone number for assistance.

The piping and associated facilities are also required to undergo quality control and testing during manufacturing and construction. Algonquin's quality assurance/quality control includes having its inspectors at the manufacturing facilities and on-site during all welding, coating, and backfill operations. All welds for the pipeline are required to be tested (non-destructively) by a third-party radiographic inspection company.

An important key to public safety is leak prevention and detection. Algonquin personnel regularly perform visual inspections of its pipeline to identify potential problems. These inspections are done on foot, by vehicle and air. Aerial inspections of the entire pipeline route are done on a regular basis. The rights-of-way are routinely viewed by vehicles at road crossings. An on-the-ground inspection is conducted annually by walking the entire pipeline route.

Government statistics cite "outside forces" as the primary cause for reportable incidents on natural gas pipelines, with "human error" in equipment usage comprising 75 percent of these events. Most of these cases involve excavating without first contacting a gas company to mark the location of the pipeline. The reference in the DEIS issued by the FERC in August to a slight increase in risk primarily involves third party damage. For this reason, Algonquin adheres to strict guidelines regulating activities within close vicinity of its facilities. For the protection of the public and the pipeline, Algonquin must approve any physical work in such vicinity. Algonquin supports third party awareness by promoting pipeline safety and public awareness. This is accomplished by community liaison meetings and mailings throughout the areas where the pipeline is located.

Algonquin is an active member and advocate of the "Dig Safe" program in Massachusetts. Through Dig Safe, Algonquin is informed of planned excavations, which allows it to monitor activities around the right-of-way to protect the pipeline. Before any type of excavation work may be done within close vicinity of its facilities, Dig Safe and Algonquin must be contacted. Algonquin will then mark the location of its facilities and will require that an inspector be present during the excavation to monitor the work. In most instances, Algonquin provides that inspection at no cost to the contractor or landowner.

Once the pipeline is in-service, Algonquin's Gas Control Center electronically monitors the operations of the pipeline. The Gas Control Center is staffed 24 hours a day, 365 days a year and uses a state of the art computerized gas monitoring system ("SCADA System") to read pressures on a continuous basis along the system every 60 seconds or less.

Safety is Algonquin's primary focus. Steel pipelines are designed, constructed and operated to avoid catastrophic events. In the course of construction and operation of the pipeline, Algonquin works closely with local communities and public safety officials through an ongoing liaison program. In the unlikely event of an emergency, Algonquin operating personnel who are headquartered in Westwood coordinate their response with the local public safety officials as noted within FERC's DEIS.

Company personnel are responsible for the pipeline in the event of an emergency. Local public safety officials (fire, police) would be responsible for protecting the public during an emergency situation and make the determination of the necessary emergency steps to take, notifying or evacuating residents if necessary. Company personnel meet with local safety officials on a regular basis in conjunction with its liaison program to ensure that the public's safety is maintained and its response activities are coordinated.

C. Ms. Harvey's Criticisms of Algonquin's Response

"Safety"

**In the first section** (where you have grouped together our questions 4-7, 13, and 16), you have addressed few of the specifics asked for in these questions: you do not indicate what activities and events are likely to cause an explosion along the line or at the M&R Station; you do not indicate what specific percentage of certainty you have that no event will occur that results in a major explosion; you do not tell us your SLO for safety; you do not tell us what kind of pressure the pipes can withstand before they are compromised; you do not tell us what the "slight" risks are that are mentioned in the DEIS (other than "third-party damage"); and you do not describe what occurs when a 750psi pipe has an explosion.

II. QUESTIONS 9, 14, 23, AND 24

A. Questions Propounded to Algonquin by Ms. Harvey and WRSE (Grouped Together by Algonquin)

**9. Where have you successfully built and maintained a pipeline of similar length and pressure in a similar environment (M&R Station so close or closer to an active quarry that is also in such a densely settled neighborhood)? Where else is there an active quarry in the middle of a major city that also has one of your 750 psi pipelines running through it? 14. Is it possible to relocate the M&R Station to a place that is not in proximity to the quarry? 23. Why did Spectra not consider alternative locations for this 5-mile spur that did not include a densely populated residential area and an active quarry across from the M&R Station? 24. One speaker stated that his home will be just a few hundred feet from the proposed M&R Station. Please ask the CEO of Spectra if he would want his children living in that same proximity to the M&R Station.**

B. Algonquin's Response

**West Roxbury Crushed Stone Quarry**

The issue of safety was initially raised by public officials, residents and local community groups in the fall of 2013. The core issue is whether Algonquin's facilities can operate safely in close proximity to an active quarry. In order to address those concerns, Algonquin commissioned

a detailed engineering study by GZA GeoEnvironmental, Inc. (“GZA”) to evaluate the possible impacts from the West Roxbury Crushed Stone Quarry’s (the “Quarry”) current and potential future blasting operations on the construction and operation of the West Roxbury Lateral pipeline and the meter and regulator station. The GZA study was completed and filed with FERC on March 31, 2014 for its review and consideration. Critically, the DEIS issued by FERC provides an in-depth analysis of the GZA study and the DEIS did not fault the conclusions within the study which are summarized below.

The GZA study took an extremely conservative approach by assuming that the Quarry was allowed to blast within five (5) feet of the sidewalk along Grove Street in West Roxbury. Such a location would place the Quarry’s blasting at the closest possible point to the facilities associated with Algonquin’s West Roxbury Lateral Project. In preparing its report as submitted to FERC, GZA concluded as follows:

- The current or future blasting operations at the Quarry will not affect the safe operation and integrity of Algonquin’s facilities.
- Despite the conservative approach followed concerning the proximity of the Quarry’s blasting, ground vibrations from future blasting at the Quarry will not damage the proposed pipeline and the pipeline had a minimum factor of safety of ten (10) to twenty (20) times its design strength.
- The blasting at the Quarry will not be disruptive or damaging to the meter and regulator station at the intersection of Grove and Centre Streets due in part to the station’s design and because the meter station will be located even further away from the Quarry than the pipeline, with the impact from blasting dissipating over distance.
- The likelihood that a piece of fly-rock from the Quarry might hit and damage the meter and regulator station is calculated to be in the range of 10,000,000 to 1, and the possibility that such a direct hit might actually cause a release of gas in any amount is even less likely.

Subsequent to the preparation of the GZA report which assumed that blasting occurred within five feet of the sidewalk, State Senator Michael Rush successfully passed legislation which restricts the ability of the Quarry to blast within five hundred (500) feet of Algonquin’s facilities absent state approval and a specific finding by the state that such blasting is completely safe. It is also important to recognize that blasting at the Quarry is performed under a permit issued by the Fire Department for the City of Boston which, as FERC’s DEIS notes, specifies a limit on the allowable blast-induced vibration magnitude at any abutting property of 1.0 inch per second.

Algonquin would also note that two existing gas pipelines and a waterline have been operating within Grove and Centre Streets, adjacent to the Quarry, for several decades with no appreciable effect on the community’s safety or the Quarry’s operation.

#### C. Ms. Harvey’s Criticism of Algonquin’s Response

**In the second section** (where you have grouped together our questions 9, 14, 23, and 24), again you fail to address the actual questions asked: you do not tell us where you have successfully built and maintained a pipeline similar to the WR Lateral and an M&R Station in this densely a populated area and adjacent to a blasting quarry; you do not answer yes or no to the question of

whether it is possible to relocate the M&R Station to a place not in proximity to the West Roxbury quarry; you do not tell us the Spectra CEO's answer to whether he would want his children living in this kind of proximity to the M&R Station.

### III. QUESTIONS 1 AND 2

#### A. Questions Propounded to Algonquin by Ms. Harvey and WRSE. (These questions were grouped together by Algonquin)

**1. If an explosion happened along any point in the five-mile pipeline, what would the blast radius be? How many residents and homes would be affected by the blast and the ensuing fires? 2. If an explosion happened at the M&R Station, what would the blast radius be? How many residents and homes would be affected by the blast and the ensuing fires?**

#### B. Algonquin's Response

Safety is Algonquin's top priority in the construction, operation and maintenance of its facilities. According to National Transportation Safety Board statistics, the interstate natural gas pipeline system is the safest energy delivery system in the nation. The pipeline and the meter and regulator station are designed, constructed and operated to meet or exceed the safety requirements exclusively governed by the U.S. Department of Transportation ("U.S. DOT").

It is important to note that in the Draft Environmental Impact Statement issued on August 6<sup>th</sup>, the FERC concluded that Algonquin's implementation of the safety measures which are reflected in its filing would ensure public safety and the integrity of its proposed facilities.

The U.S. DOT is responsible for establishing the requirements and oversight of the operation and maintenance of interstate natural gas pipelines. In that capacity, regional U.S. DOT representatives perform periodic inspections of Algonquin as the pipeline operator by reviewing its records, operating and maintenance procedures and facilities to ensure that Algonquin's operating practices meet or exceed U.S. DOT regulations.

A pipeline rupture or similar occurrence at the meter and regulator station is highly unlikely. In fact, the U.S. DOT design and operating criteria are developed specifically to avoid those types of events. Algonquin and the pipeline industry in general make every effort to avoid and prevent such occurrences. Algonquin works with local authorities and the Dig Safe Program to educate third parties about the necessary communications when a contractor needs to perform construction on and around the pipeline right-of-way or in the general vicinity of the meter and regulator station. Additional detail concerning the strong focus which Algonquin brings to the construction, operation and maintenance of its facilities was included within Resource Report 11 as filed with Algonquin's application at the FERC; a copy of Resource Report 11 is included as an attachment to these responses.

Algonquin has safely operated pipelines in Massachusetts and the region for over sixty years. The safe operation of the Algonquin pipeline system is due to procedures and specifications that incorporate multiple layers of safety into the design, materials procurement, construction and

operation as described more fully in the *General Pipeline Safety Information* section included with these responses.

C. Ms. Harvey's Criticisms of Algonquin's Response

**In the third section** (where you have grouped together our questions 1 and 2), you have not answered what the blast radius would be in either situation or told us how many residents and homes would be effected. (We are aware that the accompanying PDF you sent provides a formula for a blast radius calculation. Using 750psi and a 16-inch pipe, we came up with a radius of slightly over 300 feet. However, given that Spectra is expert at this, why wouldn't you just provide us with the radius information—or at this point confirm our calculation—as well as tell us the number of residents/homes that would be affected?)

IV. QUESTION 11

A. Question Propounded to Algonquin by Ms. Harvey and WRSE

**11.What materials will be used for the M&R Station? Are they explosion-proof?**

B. Algonquin's Response

The meter and regulator ("M&R") Station will consist of a metering building, two exterior gas heaters, a regulating building, and above-ground and underground gas pipelines. The M&R Station site will be enclosed in a security fence. The two buildings will be engineered, single-level structures with minimum 4-inch thick reinforced concrete walls and a 4- to 6-inch thick reinforced concrete roof. The exterior above-ground structures, pipes, and supports will be steel construction. The buildings and heaters will be supported on concrete foundations. All sensitive M&R Station piping, instruments and components will be located inside of the reinforced concrete buildings.

C. Ms. Harvey's Follow-Up Question

**In the fourth section** (question 11), we have a follow-up question to your answers: at what point will the community be able to see what the M&R Station will look like and will there be a community process to review the proposed station? You have made representations that the M&R Station will use brick and be screened, but we have not seen any documentation in regard to these statements.

V. QUESTIONS 3, 12, AND 20

A. Questions Propounded to Algonquin by Ms. Harvey and WRSE (Grouped Together by Algonquin)

**3. In the event of an emergency, how long would it take Spectra and/or National Grid to turn off the gas to the line and to the M&R Station to avoid further damage and loss of life? (It took PG&E approximately 1.5 to 2 hours in the San Bruno blast.) 12. Where will the shut-off valves for the M&R Station be located? 20. An elementary school is located less than a mile away from the proposed high-pressure pipeline. Explain what precautions will be taken to protect these children in the event of a leak or explosion at the pipeline.**

## B. Algonquin's Response

Remotely operated valves are installed along the pipeline to control and shut off the flow of gas. The spacing of these valves is regulated by the U.S. Department of Transportation ("U.S. DOT"). As required by U.S. DOT standards, mainline valve sites are located at specified intervals depending upon the population density. Algonquin plans to install mainline valves at the beginning of the route in Westwood and at the M&R Station in West Roxbury. A typical valve site is comprised of an area that is enclosed by a fence measuring approximately 50 feet by 50 feet surrounding an aboveground valve and piping. In addition, an additional shut-off valve will be located at the interconnection between Algonquin's pipeline and Grid's facilities in West Roxbury.

With the remote operating capability, our Gas Control Center can immediately begin a safe shutdown and isolation of a section of pipeline in the event of an emergency. The remotely operated valves close within 60 to 90 seconds.

As noted elsewhere, company personnel are responsible for the pipeline in the event of an emergency. Local public safety officials (i.e., fire, police) would be responsible for protecting the public, including nearby schools, during any emergency situation. Company personnel meet with local safety officials on a regular basis in conjunction with its liaison program to ensure that the public's safety is maintained and response activities are coordinated.

As noted previously, the DEIS which FERC issued on August 6<sup>th</sup> concluded that Algonquin's implementation of the safety measures which are reflected in its filing would ensure public safety and the integrity of its proposed facilities.

## C. Ms. Harvey's Criticisms of Algonquin's Response

**In the fifth section** (where you have grouped together our questions 3, 12, and 20), you have not answered the question as to what precautions will be taken to protect the children in the nearby school in the event of a leak or explosion, except with the usual generalities. In addition, you state that "Algonquin plans to install mainline valves at the beginning of the route in Westwood and at the M&R station in West Roxbury." The literal meaning and implication of this statement appears to be that the only mainline valving along the entire WR Lateral will be at the beginning and end of the lateral. If anything happens within the entire stretch of the WR Lateral that requires gas shut off, it would occur (apparently automatically) back in Westwood. We would ask you at this time to rectify this statement with subsequent statements that a section of pipe can be isolated if necessary. For example, in the section on Air Emissions (page 18), you claim that "all gas releases for maintenance operations is minimized to small sections of pipe." Can you follow up with an explanation of how both these statements can be true? Perhaps there are alternative mechanical mechanisms for accomplishing this, rather than mainline valving?

VI. QUESTIONS 21, 25, 26, 27, 28, 29

- A. Questions Propounded to Algonquin by Ms. Harvey and WRSE. (These questions were grouped together by Algonquin)

### **Project Need**

**21. Has there been a cost-benefit analysis done on the supply of gas through a new line vs. fixing the current leaks in the system? 25. In light of all the leaks in the existing gas pipes, can the added pressure from the high-pressure line be handled safely? 26. Is this gas going into a liquefied station? Can Spectra promise us it will not be LNG? 27. Is the sole purpose of the West Roxbury Lateral at full capacity to deliver 30,000 decatherms to National Grid or is Spectra anticipating other uses? 28. Is there any reason Spectra could not bring the extra gas in through a lower pressure line? 29. How many communities will be served by the 750 psi line coming into West Roxbury?**

- B. Algonquin's Response

The West Roxbury Lateral Project (the "Project") is being developed by Algonquin in order to provide additional pipeline capacity to National Grid ("Grid") so that Grid can meet its immediate and planned load growth demands within the West Roxbury area and the City of Boston. In fact, the agreement between Algonquin and Grid which forms the basis for Algonquin's Project was subject to review and approval by the Massachusetts Department of Public Utilities (the "Department"). Based on a filing made by Grid with the Department in September 2013, the Department found that the contract between Algonquin and Grid was in the public interest and was necessary to enable Grid to meet its forecasted demand for its customers in the West Roxbury/Boston area. Both the Attorney General and the Massachusetts Department of Energy Resources had recommended approval of the contract between Algonquin and Grid as necessary for Grid to be able to meet its forecasted demand. In its filing with the Department, Grid noted that Algonquin's Project would be a dedicated lateral to serve Grid's distribution system. Grid maintained that the primary reasons why the Project would be beneficial and was needed for Grid's distribution system and its customers was to improve system reliability, to facilitate upgrades to the local distribution system in West Roxbury, and to support long-term growth. Specifically, Grid noted the following:

- Ninety-five percent of the homes and businesses in West Roxbury use natural gas and Algonquin's West Roxbury Lateral will provide significant enhancements to the reliability of supply into this portion of the Grid service territory.
- Its gas system could be modernized and replaced with higher pressure (60 psig) plastic gas mains, which would be more efficient and cost effective than replacing the existing low pressure system. That modernization program has already been initiated by Grid in anticipation of the additional supply to be provided by the Project.
- New gas customers are driving the need for additional supply even with ongoing energy efficiency gains. For example, Grid estimates that there could be nearly 146,000 potential new customers in the Boston area that could be supported by the completion of Algonquin's Project, with a corresponding benefit for the entire City due to cleaner air which will result from the lowering of greenhouse gas emissions.

The West Roxbury Lateral also helps Grid resolve gas distribution system reliability issues in West Roxbury. For example, Grid has estimated that 15 percent of peak day supplies are delivered from its Commercial Point facility in Dorchester. Absent the West Roxbury Lateral being in-service, an outage at that facility would result in wide spread system outages. Similarly, Grid has noted that 25 percent of its peak day supplies are delivered into Boston on Algonquin's J-lateral. In the event of an outage on the J-lateral on a cold day (i.e., 15 degrees), Grid has estimated that tens of thousands of its customers would lose service without the West Roxbury Lateral.

There is no intent to use the gas supplied through the Project for LNG production or export. The DEIS issued by FERC on August 6<sup>th</sup> addressed this issue and concluded that the Project is not designed for the export of natural gas.

C. Ms. Harvey's Criticisms of Algonquin's Response

**"Project Need"** (where you have grouped together our questions 21 and 25-29), you do not answer the question about a cost-benefit analysis; you do not answer the question in regard to the 30,000 decatherms; you do not answer whether a low-pressure gas line could accomplish the same goal for National Grid.

VII. QUESTIONS 14, 19, AND 23

A. Questions Propounded to Algonquin by Ms. Harvey and WRSE. (These questions were grouped together by Algonquin)

**14. Is it possible to relocate the M&R Station to a place that is not in proximity to the quarry? 19. Explain why this route for the West Roxbury Lateral is the best route available for this incoming pipeline. 23. Why did Spectra not consider alternative locations for this 5-mile spur that did not include a densely populated residential area and an active quarry across from the M&R Station?**

## B. Algonquin's Response

National Grid ("Grid") requested a new delivery point located in the West Roxbury section of the City of Boston to connect with, enhance and reinforce system reliability during outage situations and support long-term growth in the Boston region. The site for the new delivery point cannot be reached by the existing Algonquin pipeline system. As a result, it is necessary to install approximately 4.9 miles of new lateral pipeline and a new meter and regulator ("M&R") Station to provide Grid with the service it has requested.

Algonquin initially identified another route for the West Roxbury Lateral which is identified in its FERC filing as the West Roxbury Lateral Alternative. The West Roxbury Lateral Alternative route deviated from the currently proposed route for the West Roxbury Lateral on Washington Street in the Town of Dedham. The alternate route followed Incinerator Road off of Washington Street and existing parking lots and driveways for a variety of commercial properties for approximately 0.7 miles before paralleling Providence Highway and crossing into West Roxbury. The alternative route then went cross country and intersected with Belle Avenue. At this point, the route followed various residential roadways including Belle Avenue, Baker Street, Spring Street and Alaric Street before intersecting with the proposed alignment.

Significant concern was raised at that time about the alternative route primarily because of its proximity to residential structures and the surrounding neighborhoods, particularly in the vicinity of Belle Avenue. For example, the alternative alignment would have crossed through the backyards of several residential homes, impacted a number of residential streets, and caused significant disruption to the surrounding neighborhood. Construction in these areas would also have required complete closure of these residential streets. In addition, if this alternative route were to be used, the required M&R Station would have to be located on private property at the intersection of Centre Street and Alaric Street, which does not present any favorable land options for locating the M&R Station. For example, one option would have required the purchase and demolition of a residential property at the corner of Centre and Alaric Streets.

In addition, after detailed engineering review, it was determined that finding a location for the proposed M&R Station along the West Roxbury Lateral Alternative would have resulted in greater impacts due to the presence of residential homes, school athletic facilities and traffic congestion as compared to the proposed M&R Station site at the intersection of Grove and Centre Streets on the preferred route. The proposed M&R Station site is located at the intersection of Centre Street and Grove Street on a 4.11-acre undeveloped property. This provides a more feasible option for siting the new M&R Station in West Roxbury. In addition, this site was superior in terms of allowing the Project to help screen the M&R Station from view due to the existing growth on that parcel.

A detailed analysis of the West Roxbury Lateral Alternative Route was performed by the Federal Energy Regulatory Commission in conjunction with its preparation of its DEIS. Based on that review, the DEIS concluded that the alternative route was not preferable to or otherwise provided a significant advantage over the proposed route. Moreover, the DEIS also discussed the proposed location of the M&R Station in West Roxbury and compared it with the possible location at the intersection of Centre and Alaric Streets. The DEIS determined that the alternative location was not technically feasible or environmentally preferable when compared to the proposed site off of Grove

Street. The DEIS also concluded that no other viable alternative sites had been identified for the M&R Station in West Roxbury.

In recent weeks, the Project has also been asked about the possibility of Algonquin's West Roxbury Lateral Project tying-in to the Grid system by traveling up the VFW Parkway and connecting on Rivermoor Street. Basically, a tie-in at Rivermoor Street would not support Grid's intermediate pressure system as the pipe infrastructure at Rivermoor is insufficient to provide the needed takeaway capacity or pressure support which Grid requires in order to serve its customers. In fact, an additional pipeline would still need to be installed from Rivermoor Street to the current interconnection with Grid near Temple and Centre Streets in order to achieve the needed benefits. Thus, instead of one pipeline, the project would have two pipelines running through West Roxbury, and the overall length in Boston would increase by close to two miles. In contrast, the West Roxbury Lateral as presently configured meets Grid's requirements by interconnecting to Grid at Spring and Centre Streets.

In summary, the DEIS issued by FERC conducted an exhaustive review of alternative routes and concluded that none offered significant environmental advantages over the alignment proposed by the Project.

#### C. Ms. Harvey's Criticisms of Algonquin's Response

"Alternatives Discussion" (where you have grouped together our questions 14, 19, and 23): while your answer may be technically factual, it is our feeling that you continue to miss the larger point about alternative locations, that is, that you have not considered alternatives that are entirely different, not just alternatives that simply constitute variations on the one locational approach. Your claim that what has occurred to date has been an "exhaustive review of alternative routes" is untenable absent fuller discussion of alternatives intended to meet National Grid's request for additional capacity in southwest Boston.

#### VIII. OTHER CRITICISMS BY MS.HARVEY

In addition to the follow up above, we are requesting information about a statement Spectra makes in its recent filings on FERC's website in response to additional information requested by FERC on Oct. 22. In the section with respect to the West Roxbury community, Spectra states: "Numerous discussions with Boston Mayor Martin Walsh's office as well as the Boston City Council, including City Councilors Matt O'Malley and Michelle Wu, occurred over the summer and into the fall. The discussions focused on the proposed route through West Roxbury and issues related to the location of the Project's facilities in the vicinity of the West Roxbury Crushed Stone Quarry." We ask that you supply us with the dates of these "numerous discussions" with the City Council (including Councilors O'Malley and Wu) and the mayor that you say took place, according to the filing, over the summer and fall of 2014.

Finally, I have to take issue with the characterization by Spectra in these recent filings that Algonquin was never "officially invited to the meeting [on October 8] by WRSE." Mr. Bonsall, we sat in the same room together, and you know that I personally requested of you twice during that meeting (at the beginning and at the end) that Spectra send representatives to the Oct. 8 Community Meeting. You are also well aware that, on the community's and WRSE's behalf,

multiple requests were made by Congressman Lynch's office and also the mayor's office that Spectra attend the Community Meeting on Oct. 8.

We will look forward to receiving responses to the question immediately above in regard to the meeting dates and, we hope this time, specific answers to our original specific questions, as opposed to more general statements and reiterations of material already available on the FERC website and in the GZA report, with which we are familiar.

FEDERAL ENERGY REGULATORY COMMISSION  
WASHINGTON, D.C. 20426

In Reply Refer To:  
OEP/DPC/CB-2  
Algonquin Gas Transmission,  
LLC  
Docket No. CP14-96-000  
§ 375.308(x)(3)  
December 2, 2014

Berk Donaldson  
Director, Rates and Certificates  
Algonquin Gas Transmission, LLC  
P.O. Box 1642  
Houston, Texas 77251-1642

Re: Data Request

Dear Mr. Donaldson:

Please provide the information described in the enclosure to assist in our analysis of Algonquin Gas Transmission, LLC's (Algonquin) proposal in the above application.

File your response in accordance with the provisions of the Commission's Rules of Practice and Procedure. In particular, 18 C.F.R. § 385.2010 (Rule 2010) requires that you serve a copy of the response to each person whose name appears on the official service list for this proceeding.

**Please file a complete response within 10 business days of the date of this letter.** If certain information cannot be provided within this time frame, please indicate which items will be delayed and provide a projected filing date. Any Critical Energy Infrastructure Information should be filed as non-public and labeled "Contains Critical Energy Infrastructure Information-Do Not Release" (18 C.F.R. § 388.112), and should be filed separately from the remaining information, which should be marked "Public."

File all responses under oath (18 C.F.R. § 385.2005) by an authorized representative of Algonquin and include the name, position, and telephone number of the respondent to each item.

Docket No. CP14-96-000

Steven E. Hellman  
Associate General Counsel  
Algonquin Gas Transmission, LLC  
P.O. Box 1642  
Houston, Texas 77251-1642

**Enclosure**

1. Provide both steady-state and transient models of Algonquin's pipeline system, operating under both existing and proposed conditions. Algonquin can do so by using either one of the commercially available pipeline simulation software packages, Gregg Engineering WinTran and DNV GL SynerGi Pipeline USM, currently licensed by the Commission or an in-house developed program.
2. If Algonquin does not currently utilize either of the aforementioned software programs utilized by the Commission, provide the transient data (input and output) for Algonquin's pipeline system operating under both existing and all proposed conditions for each operational scenario Algonquin utilizes in order to evaluate the operational capabilities/performance while designing for new services. For these transient models, Algonquin should provide input and output files for a minimum of three days operating at off-peak hourly and peak day hourly usage (6 percent hourly load or maximum currently used by Algonquin) for each pipeline segment examined by Algonquin to generate results necessary to evaluate the need of the proposed mainline facility augmentation. The data, submitted in tabular form in Microsoft Excel spreadsheet(s), must include the following calculated information for its pipeline system both before and after the AIM Project for each time step examined (or a maximum of  $\Delta t = 0.1$  hours).
  - a. the length, (internal) diameter and maximum allowable operating pressure of each pipe segment;
  - b. the gas velocity for each pipe segment;
  - c. the flows and pressures, including the minimum and maximum values, for each node or point of interest;
  - d. the flows and set pressures of all regulating facilities;
  - e. the flows, including the inlet and outlet pressures, for all the compressor stations;
  - f. the horsepower utilization and operating status of each unit for each compressor station; and
  - g. the compressor curves for each compressor unit used at each compressor station.
  - h. All data must be provided and filed with the Commission in electronic format.

3. As part of Algonquin's response, highlight the facilities, starting at the inlet of the Hanover Compressor Station (CS) and continuing through the outlet of the Oxford CS, that were used by Algonquin to generate the Exhibit G and G-I flow diagrams submitted in this proceeding. Discuss, in detail, how the new facilities are needed to allow Algonquin to meet its proposed delivery requirements while maintaining service to its existing shippers.

CP14-96-000 Algonquin Data Request 120214.DOC.....1-5

CP14-96

**ASSOCIATED  
PUBLIC FILE****FEDERAL ENERGY REGULATORY COMMISSION  
WASHINGTON, DC 20426**

December 2, 2014

**OFFICE OF THE CHAIRMAN**

The Honorable Martin J. Walsh  
Mayor  
City of Boston - Boston City Hall  
One City Hall Square  
Boston, MA 02201

Dear Mayor Walsh:

Thank you for your October 24, 2014, letter regarding Algonquin Transmission, LLC's (Algonquin) Algonquin Incremental Market Project (in Federal Energy Regulatory Commission's Docket No. CP14-96-000). Specifically, you request alternative routes and location for the proposed West Roxbury Lateral and Metering and Regulating Station, as well as additional review of the safety and health impacts associated with locating pipeline facilities in a densely residential area and near an active quarry.

The Commission staff's review of the Algonquin Incremental Market Project has included an independent review of numerous alternatives developed by stakeholders. For example, the draft environmental impact statement (EIS) for this proposal, issued on August 6, 2014, discusses and evaluates two route alternatives for portions of the West Roxbury Lateral. The draft EIS also recognizes the potential conflicts associated with the proposed facilities being located near an active quarry. Specifically, the draft EIS incorporates an analysis of the current and potential future expanded quarry blasting operations and its effects on the pipeline and aboveground meter and regulating station. Section 4.12 of the draft EIS identifies extensive safety information about the project, presenting the U.S. Department of Transportation's pipeline safety standards and how they relate to the population density around the pipeline, pipeline accident data, and the impact on public safety.

Currently, Commission staff is preparing the final EIS, which will address all the comments received during the draft EIS comment period, including those regarding alternatives, safety, and the quarry's blasting operations. When we complete the final EIS, it will be issued, noticed in the *Federal Register*, and mailed to the environmental mailing list. The Commission will consider its findings (along with the results of the staff's review of the project engineering, markets, costs, financing, and rates) before making its decision on whether or not to authorize this project.

2014-00253

J.A. - 0696

-2-

In the end, our decision on whether to authorize this project will be based on a careful review of the safety, security, and environmental issues relating to this project and will be rooted in the law, facts, and science. I hope the above information has been helpful. If I can be of any further assistance in this or any other Commission matter, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read 'Cheryl A. LaFleur', with a stylized flourish at the end.

Cheryl A. LaFleur  
Chairman

<i>Office of Energy Projects – Division of Gas Environment and Engineering – Gas Branch 2</i>		<b>Docket No.</b> CP14-96-000
<b>Interagency Meeting</b>		
<b>Date of Meeting:</b> 10/17/2014		<b>Project:</b> Algonquin Incremental Market Project (AIM Project)
<b>Purpose:</b> Discuss the Nuclear Regulatory Commission’s (NRC) review of Entergy’s Safety Evaluation for Indian Point		
<b>Name</b>	<b>Affiliation</b>	
Maggie Suter	Federal Energy Regulatory Commission (FERC)	
Doug Pickett	NRC	
Sara Mroz	NRC	
Ben Beasley	NRC	
Sam McCarver	NRC	
Art Burritt	NRC	
Tom Setzer	NRC	
Jennifer Lee	Natural Resource Group, LLC	

### Meeting Summary:

FERC had a conference call with the NRC to discuss its review of Entergy’s site hazards analysis for the Indian Point Energy Center (IPEC) relative to Algonquin’s proposed AIM Project. NRC has received Entergy’s 50.59 submission, which included Entergy’s conclusion that the AIM Project would not present an additional safety hazard for the IPEC facility. NRC conducted an independent analysis of Entergy’s 50.59 submission, which included a site inspection and review of the IPEC site during the week of September 22, 2014. NRC also conducted an independent, confirmatory blast analysis. In the area where a postulated pipeline rupture could adversely affect structures, systems, and components important to safety, Algonquin committed to take additional mitigation measures to enhance the pipeline design and construction to further limit the already very low potential for a gas pipeline rupture. However, the NRC’s analysis did not allow any credit for these additional mitigation measures and assumed a catastrophic pipeline failure.. The review covered everything within the Security Owner Controlled Area (SOCA), which includes everything inside the outer most fenced area of the facility (including the spent fuel rods). Based on its review, the NRC came to the same conclusion that Entergy did in its 50.59 submission. Therefore, NRC finds Entergy’s 50.59 submission acceptable and has determined that no prior approval from the NRC is needed. NRC also indicated that the existing pipelines have been studied extensively, including as recently as 2008. NRC also confirmed that the use of “IPEC” to describe the facility is appropriate.

**Enclosure**

1. What are Algonquin's engineering design constraints for gas velocities on its pipeline system for both existing and proposed facilities? Does Algonquin use the erosional velocity as a limitation when designing its pipeline expansions? Explain and calculate the gas flow velocities on its system under both peak draft and pack conditions.
2. Under what circumstances will Algonquin allow the gas velocity to exceed its design requirements? Explain.
3. Compare and contrast Algonquin's flow diagrams with flow schematic provided by Accufacts, Inc. (Accufacts) in Exhibit No. 1 in its November 3, 2014 report.
4. Using the calculated steady-state and transient data from Algonquin's pipeline models, compare and contrast the calculated flow velocities from Algonquin's pipeline models with Accufacts' calculated flow velocities in Exhibits 4 and 5.
5. On page 2 of 11, in its November 3rd Report, Accufacts makes three accusations:
  - (i) the new 42-inch diameter pipeline in Cortland is "...considerably oversized/overbuilt for the stated capacity increase of 342 Dth/d" for the project;<sup>1</sup>
  - (ii) "(a)ctual gas velocities...for the pre-AIM existing gas transmission pipeline spanning Cortland are within acceptable ranges, but after the AIM installation are so low that considerable future possible throughput increases can be easily accommodated for these segments"; and
  - (iii) "Further Algonquin Pipeline pipe expansions in New York State are likely given the 42-inch pipe installations proposed by AIM, and the extremely high gas velocities in other existing segments of the New York system further downstream of Cortland."

Using the engineering information submitted to comply with Staff's December 2, 2014 data request, as well as this request, respond, in detail, to each of the aforementioned accusations made by Accufacts. As part of its response, Algonquin should address the segmentation issue raised by Accufacts.

---

<sup>1</sup> Although Accufacts states Algonquin is proposing to increase its capacity by 342 Dth/d, the actual capacity increase proposed by Algonquin is 342 MDth/d.

Re: *Algonquin Gas Transmission, LLC*, Docket No. CP14-96-000  
Response to December 2, 2014 Data Request

Dear Ms. Bose:

On February 28, 2014, Algonquin Gas Transmission, LLC (“Algonquin”) filed its Abbreviated Application for a Certificate of Public Convenience and Necessity and for Related Authorizations (“Application”) with the Federal Energy Regulatory Commission (“Commission”) for its Algonquin Incremental Market Project (“Project”). On December 18, 2014, the Commission Staff issued a Data Request in the referenced proceeding to assist in Staff’s analysis of the Project. Staff requested a complete response within 5 days of the date of that letter. Algonquin hereby submits responses to all requests in the Data Request.

If you have any questions regarding this filing, please contact me at (713) 627-5113 or DeAndra Black, Lead Analyst, Rates and Certificates at (713) 627-5350.

Sincerely,

/s/ Chris Harvey

**Algonquin Gas Transmission, LLC**  
**Docket No. CP14-96-000**  
**Response to Data Request Dated December 18, 2014**

**DATA REQUEST RESPONSE**

1. *What are Algonquin's engineering design constraints for gas velocities on its pipeline system for both existing and proposed facilities? Does Algonquin use the erosional velocity as a limitation when designing its pipeline expansions? Explain and calculate the gas flow velocities on its system under both peak draft and pack conditions.*

**Response 1**

- a. Algonquin uses 100 feet per second as the limitation on gas velocities when designing its pipeline expansion(s) and for existing facilities.
- b. Algonquin does not use erosional velocity as a limitation when designing its pipeline expansions. See response to 1(a) above.
- c. The peak draft condition gas velocities were submitted in Response 2(b) to Staff's data request of December 2, 2014.<sup>1</sup> With respect to pack condition gas velocities, AGTFlow does not produce a report with the calculated gas velocities for the Packing period. Packing period gas velocities will be lower than those of the Draft period and they will not exceed the 100 feet per second design criteria.

---

<sup>1</sup> Responses to the December 2, 2014 FERC Data Request, Docket No. CP14-96-000 (submitted Dec. 11, 2014) ("December 11 Response").

**Algonquin Gas Transmission, LLC**  
**Docket No. CP14-96-000**  
**Response to Data Request Dated December 18, 2014**

**DATA REQUEST RESPONSE**

2. *Under what circumstances will Algonquin allow the gas velocity to exceed its design requirements? Explain.*

**Response 2**

As stated in Response 1(a) above, Algonquin uses 100 feet per second for maximum gas velocities as its design criteria for expansions. On smaller laterals, there may be sections of pipeline on which velocities exceed 100 feet per second. The velocities on these sections are evaluated on a case-by-case basis to determine if the velocities are detrimental to the performance of the Algonquin system or if they inhibit the ability of the system to meet contractual requirements for pressure and flow. If the velocities are deemed to be acceptable after an evaluation, the velocities remain as calculated. If the velocities and accompanying pressure losses are deemed unacceptable, Algonquin will address the issue using various methods, including (i) using higher operating pressure, (ii) looping of the applicable section, (iii) using take up and relay, and (iv) using any combination of (i), (ii) and (iii) that Algonquin determines is appropriate.

**Algonquin Gas Transmission, LLC**  
**Docket No. CP14-96-000**  
**Response to Data Request Dated December 18, 2014**

**DATA REQUEST RESPONSE**

3. *Compare and contrast Algonquin's flow diagrams with flow schematic provided by Accufacts, Inc. (Accufacts) in Exhibit No. 1 in its November 3, 2014 report.*

**Response 3**

The maximum allowable operating pressure ("MAOP") of the 26-inch diameter pipeline in Accufacts' Exhibit No. 1 is incorrect. The actual MAOP of the 26-inch diameter pipeline is 674 psig. Other than this typographical error which appears twice, Accufacts' Exhibit No. 1 is a reasonable interpretation of the flow of gas extracted from Algonquin's flow diagrams for the area around Cortlandt, New York.

**Algonquin Gas Transmission, LLC**  
**Docket No. CP14-96-000**  
**Response to Data Request Dated December 18, 2014**

## DATA REQUEST RESPONSE

4. *Using the calculated steady-state and transient data from Algonquin's pipeline models, compare and contrast the calculated flow velocities from Algonquin's pipeline models with Accufacts' calculated flow velocities in Exhibits 4 and 5.*

### Response 4

Algonquin does not use a steady-state model for design purposes, as such Algonquin does not have steady-state based calculated flow velocities to compare to Accufacts' calculated flow velocities. A comparison of calculated flow velocities from Algonquin's transient pipeline models with Accufacts' calculated flow velocities in Exhibits 4 and 5 reflect generally consistent velocities. Specifically, there is a 95% agreement (*i.e.*, less than a 5% variance) in magnitude between the estimated Accufacts' velocities and the Algonquin calculated velocities.

The only significant exception is the 'Post-AIM' regulator-induced velocity change near Cortlandt, New York, on Accufacts' Exhibit 5 (downstream of the 'New Pressure Reducing/Letdown Valve), which Accufacts estimates as 38 fps compared to Algonquin's calculated velocity of 56 fps. Without knowing the assumptions made by Accufacts, it is indeterminable why Algonquin's velocity is higher than Accufacts at this segment. Moreover, due to the volatile flow dynamics experienced by a regulator, simulated flow calculations of a regulator can vary dramatically if consistent assumptions are not made.

GAS VELOCITY COMPARISON - ACCUFACTS vs. AGTFLOW				
EXHIBIT 4	PRE AIM		POST AIM	
	Velocity, FPS		Velocity, FPS	
SEGMENT	ACCUFACTS	AGTFLOW	ACCUFACTS	AGTFLOW
Near Cortland exit	~50	~48	<40	~37
Near Southwest CS	~69	~65	~76	~74
EXHIBIT 5	PRE AIM		POST AIM	
	Velocity, FPS		Velocity, FPS	
SEGMENT	ACCUFACTS	AGTFLOW	ACCUFACTS	AGTFLOW
Near Cortland exit	~55	~52	~27/~38	~26/~56
Near Southwest CS	~76	~72	~87	~82

There is, however, a consistent increase in both Accufacts' and Algonquin's calculated velocity downstream of the regulator. This consistent trend upward at this and at all other segments, in conjunction with the agreement in magnitude at all other segments, demonstrates an overall close alignment between Accufacts' and Algonquin's calculated flow velocities.

**Algonquin Gas Transmission, LLC**  
**Docket No. CP14-96-000**  
**Response to Data Request Dated December 18, 2014**

## DATA REQUEST RESPONSE

5. *On page 2 of 11, in its November 3rd Report, Accufacts makes three accusations:*

*(i) the new 42-inch diameter pipeline in Cortland is "...considerably oversized/overbuilt for the stated capacity increase of 342 Dth/d" for the project;<sup>2</sup>*

*(ii) "(a)ctual gas velocities...for the pre-AIM existing gas transmission pipeline spanning Cortland are within acceptable ranges, but after the AIM installation are so low that considerable future possible throughput increases can be easily accommodated for these segments"; and*

*(iii) "Further Algonquin Pipeline pipe expansions in New York State are likely given the 42-inch pipe installations proposed by AIM, and the extremely high gas velocities in other existing segments of the New York system further downstream of Cortland."*

*Using the engineering information submitted to comply with Staff's December 2, 2014 data request, as well as this request, respond, in detail, to each of the aforementioned accusations made by Accufacts. As part of its response, Algonquin should address the segmentation issue raised by Accufacts.*

### Response 5

#### Response 5(i)

As explained in Response 3 of the December 11 Response, the 42-inch diameter pipeline is properly sized to meet Algonquin's existing demand and the AIM Project capacity, and is both environmentally preferable and operationally beneficial compared to the installation of a smaller diameter pipeline. Accufacts' claim that the 42-inch diameter pipeline is oversized/overbuilt for the capacity increase is based on a faulty premise. Specifically, the Accufacts analysis improperly assumes that the 42-inch diameter pipeline is a stand-alone pipe and not part of the larger system. Further, Accufacts fails to consider the length of the replacement segments into its calculation, the environmental impact of that pipeline and the operational costs to Algonquin's shippers of non-uniform pipeline diameters.

Algonquin's design takes into consideration all of Algonquin's obligations, both existing and those proposed as part of the AIM Project, over its entire system and not just at the individual section that is the subject of the Accufacts Report. In addition, in designing the AIM Project to

---

<sup>2</sup> Although Accufacts states Algonquin is proposing to increase its capacity by 342 Dth/d, the actual capacity increase proposed by Algonquin is 342 MDth/d.

**Algonquin Gas Transmission, LLC**  
**Docket No. CP14-96-000**  
**Response to Data Request Dated December 18, 2014**

**DATA REQUEST RESPONSE**

meet these obligations, Algonquin was required to ensure that gas flows on its system (i) would not exceed the MAOP of its system at Lambertville, (ii) would meet minimum contractual delivery pressures, (iii) would not exceed the maximum velocity of 100 fps, and (iv) would maintain suction pressures at the various compressor stations at not less than approximately 350-400 psig.

The AIM Project continues the take up and relay of 26-inch diameter pipe with 42-inch diameter pipe that started with the Ramapo Project in Docket No. CP06-76-000. In the Ramapo Project, Algonquin lifted and replaced approximately 4.8 miles of the existing 26-inch diameter pipeline to address increased pressure losses on the Algonquin system as a result of the Ramapo Project volumes and thereby allow the entirety of the Algonquin system to meet Algonquin's existing and Ramapo Project contractual obligations. Similarly, Algonquin is now proposing the take up and relay of additional segments of the 26-inch diameter pipeline to address the increased pressure losses on the Algonquin system as a result of the AIM Project volumes and allow the entirety of the Algonquin system to meet Algonquin's existing and AIM Project contractual obligations.

The length of the take-up and relay segments is as crucial a factor in determining proper sizing as is the diameter of the pipeline. Algonquin could have proposed a smaller diameter pipe but with a smaller diameter comes diminished performance (higher pressure losses and higher gas velocities). Thus, Algonquin would have been required to take-up and relay longer lengths of existing pipeline to address the diminished performance associated with a smaller diameter pipeline, which in turn would have increased the disturbance to the environment and the surrounding communities. In response to Accufacts' claims, Algonquin considered the alternate design utilizing 36-inch diameter pipeline instead of the proposed 42-inch diameter pipeline.<sup>3</sup> However, the smaller diameter pipeline alternative would require approximately 15.80 miles of lift and relay; almost 3.95 miles more than the proposed 11.85 miles of 42-inch diameter replacement pipeline.<sup>4</sup> Furthermore, utilizing smaller diameter pipeline would have been required Algonquin to install additional pig launcher/receiver facilities.

The 42-inch diameter replacement pipeline was also designed to maintain an appropriate operating pressure on Algonquin's system. Algonquin's system is a Pack and Draft transient system. During the Packing period, Algonquin is required to have sufficient internal pipe volume to accommodate all the gas being received and the requirement of the immediate Draft period that follows. If Algonquin were to install less than the proposed 11.85 miles of 42-inch diameter pipeline as part of the lift and relay, then the hydraulic model would reflect pressure at

---

<sup>3</sup> Algonquin also considered an alternate design utilizing 30-inch diameter pipeline. Even if Algonquin replaced the entire section from the Stony Point discharge to the suction of the Southeast compressor station, this alternative design would not produce sufficient volume to meet all of Algonquin's obligations.

<sup>4</sup> Notably, both the 42-inch diameter proposal and the 36-inch diameter alternative would yield velocities below the maximum of 100 fps. Accordingly, velocity was not a critical factor for determining the size of the replacement pipe.

**Algonquin Gas Transmission, LLC**  
**Docket No. CP14-96-000**  
**Response to Data Request Dated December 18, 2014**

**DATA REQUEST RESPONSE**

Lambertville in excess of the MAOP of the pipeline. Given that Lambertville is the largest receipt point into Algonquin, this overpressure is an indication that there would be insufficient pipe volume to accommodate the volume of gas being received from the various supply points.

**Response 5(ii);**

The observation made in the Accufacts report regarding the ability of the proposed 42-inch diameter pipeline to accept future expansions is correct, but any such future expansion also must be accompanied by the installation of additional facilities. At such time of a future expansion, Algonquin will propose new facilities as it did in the Ramapo Project and as it has done in the AIM Project. Those future expansion facilities will be appropriately sized to meet Algonquin's then-existing and proposed project capacity, as Algonquin has designed both the Ramapo Project and the AIM Project. Without such additional facilities, Algonquin would lack sufficient capacity on its entire system, *i.e.*, the velocities on certain segments, alone, do not provide additional capacity on the entire Algonquin system.

**Response No. 5 (iii)**

Algonquin does not agree with the Accufacts' characterization of "...the extremely high gas velocities in other existing segments of the New York system ... ." The gas velocities on Algonquin's system are within Algonquin's design criteria.<sup>5</sup> In addition, as stated above in response to Question 4, Accufacts' estimated gas velocities in Exhibits 4 and 5 are generally consistent with Algonquin's own calculated gas velocities.

Accufacts' claim that further expansions are likely given the 42-inch pipeline is also without merit. The likelihood of a future expansion does not depend on the diameter of the pipeline installed as part of the AIM Project or any other project. Instead, future expansion is caused by supply and demand. The Commission's certificate policy would permit Algonquin to expand its pipeline system if such expansion is supported by actual customer demand. If there is no demand for additional capacity beyond what Algonquin's existing system can supply, Algonquin will not propose, nor would the Commission permit Algonquin to build, additional facilities.

Finally, Accufacts' segmentation claim shows an absence of understanding of the concept of segmentation. Segmentation is a concept under the National Environmental Policy Act ("NEPA") that prohibits an agency from dividing connected, cumulative, or similar federal actions into separate projects and thereby fails to address the true scope and impact of the activities that should be under consideration. Instead of identifying a project that has been impermissibly segmented from the AIM Project, Accufacts' segmentation claim is based on a hypothetical project that must be in development because, according to Accufacts, the AIM

---

<sup>5</sup> Algonquin provided the velocities for the applicable sections in response to Question 2(b) in the December 11 Response.

**Algonquin Gas Transmission, LLC**  
**Docket No. CP14-96-000**  
**Response to Data Request Dated December 18, 2014**

**DATA REQUEST RESPONSE**

Project is oversized<sup>6</sup> and certain segments of Algonquin's system have abnormally high velocities.<sup>7</sup> For the purpose of clarification, assuming that the AIM Project was oversized or there were abnormally high velocities on Algonquin's system, these conclusions do not identify another project that is being segmented from the AIM Project environmental review. Moreover, given that both of the conclusions are rebutted above, Accufacts' hypothetical-project segmentation claim is unsupported. Finally, Algonquin has already addressed segmentation claims related to actual projects submitted in comments to the DEIS.<sup>8</sup>

---

<sup>6</sup> See Accufacts Report at 5 (stating that, because it is oversized, "the AIM Project thus appears to be either an unjustified pipeline expansion or a segmentation of a larger, system-wide upgrade.").

Re: Data Request

Dear Mr. Donaldson:

Please provide the information described in the enclosure to assist in our analysis of Algonquin Gas Transmission, LLC's (Algonquin) proposal in the above application.

File your response in accordance with the provisions of the Commission's Rules of Practice and Procedure. In particular, 18 C.F.R. § 385.2010 (Rule 2010) requires that you serve a copy of the response to each person whose name appears on the official service list for this proceeding.

**Please file a complete response within 5 days of the date of this letter.** If certain information cannot be provided within this time frame, please indicate which items will be delayed and provide a projected filing date. Any Critical Energy Infrastructure Information should be filed as non-public and labeled "Contains Critical Energy Infrastructure Information-Do Not Release" (18 C.F.R. § 388.112), and should be filed separately from the remaining information, which should be marked "Public."

File all responses under oath (18 C.F.R. § 385.2005) by an authorized representative of Algonquin and include the name, position, and telephone number of the respondent to each item.

Steven E. Hellman  
Associate General Counsel  
Algonquin Gas Transmission, LLC  
P.O. Box 1642  
Houston, Texas 77251-1642

**Enclosure**

1. Under what circumstances would the gas velocities be reduced, below 100 feet per second (fps), in order to prevent a situation where the gas velocities are determined, by Algonquin, to be detrimental to the performance of the Algonquin system? Explain.
2. How long has Algonquin used, as a design factor, a gas velocity of 100 fps? On average, how long will gas velocities remain at or above 100 fps during peak hour operations or "drafting" mode of operation on its pipeline? Explain.
3. In its January 6th Response, Accufacts continues to claim that the 42-inch diameter pipeline loop, from the Stony Point to the Southeast Compressor Stations, is overbuilt for the claimed capacity needed for the Project. As a result, Accufacts contends that a new smaller diameter pipe could have been used to meet Algonquin's throughput and pressure requirements while raising the operating pressure in order to lower the "high" gas velocities. Discuss, in detail, if this approach was evaluated by Algonquin and why this approach was not used by Algonquin for the final design of the Project facilities as Accufacts claims.
4. Accufacts continues to claim that Algonquin has this expansion project as part of an overall system upgrade. Accufacts believes that the individual subprojects should have been submitted as a greater overall application and that Algonquin is trying to avoid environmental requirements associated with that system upgrade. Discuss how Algonquin's design philosophy has incorporated its design to meet the requirements of the Project and if these facilities are part of an overall system upgrade.

Re: Docket – CP14-96-000  
Motion for Intervener Status

Dear Madam Secretary Bose:

I hereby request to become an intervener in Docket CP14-96-000.

Due to the lack of information supplied to me, a direct abutter of the proposed West Roxbury Lateral Extension, I was not informed of the danger fracked gas, the danger of a 740 high pressure pipeline and the danger of placing a Meter Compressing Station adjacent to an active, blasting quarry in my densely populated neighborhood.

I attended the Spectra Open House and they provided no information of any risk to my neighborhood.

I am directly affected by this pipeline as an abutter and wish to participate in the process. I have very slowly educated myself and have learned of many risks and dangers of this proposal. Spectra has not been forthcoming and despite technically informing the minimum amount of direct abutters, has not included all residents in the high consequence area of a gas explosion. This proposal directly affects my home value, health and safety of my family and neighbors.

Please grant me the Motion to Intervene Out of Time.

Thank you very much,

Mary Ellen McMahon  
2356 Centre Street  
West Roxbury, MA 02132

Re: *Algonquin Gas Transmission, LLC*, Docket No. CP14-96-000  
Response to January 16, 2015 Data Request

Dear Ms. Bose:

On February 28, 2014, Algonquin Gas Transmission, LLC (“Algonquin”) filed its Abbreviated Application for a Certificate of Public Convenience and Necessity and for Related Authorizations (“Application”) with the Federal Energy Regulatory Commission (“Commission”) for its Algonquin Incremental Market Project (“Project”). On January 16, 2015, the Commission Staff issued a Data Request in the referenced proceeding to assist in Staff’s analysis of the Project. Staff requested a complete response within 5 days of the date of that letter. Algonquin hereby submits responses to all requests in the Data Request.

If you have any questions regarding this filing, please contact me at (713) 627-5113 or DeAndra Black, Lead Analyst, Rates and Certificates at (713) 627-5350.

Sincerely,

/s/ Chris Harvey

**Response to Data Request Dated January 16, 2015**

**DATA REQUEST RESPONSE**

1. *Under what circumstances would the gas velocities be reduced, below 100 feet per second (fps), in order to prevent a situation where the gas velocities are determined, by Algonquin, to be detrimental to the performance of the Algonquin system? Explain.*

**Response 1**

As reflected in Response 2 to the FERC Staff Data Request dated December 18, 2014 (“December 18 Data Request”), the only facilities on which Algonquin will allow the gas velocities to exceed 100 feet per second (“fps”) are sections of pipeline on smaller laterals, *i.e.*, laterals that are 8 inches (nominal) or less in diameter.<sup>1</sup> Note that the AIM Project does not involve such laterals. Currently there are no issues with respect to delivery obligations on these laterals. There are no situations on the Algonquin system where gas velocities are detrimental to performance and any future expansions will be designed to ensure gas velocities continue to not be detrimental to system performance.

---

2. *How long has Algonquin used, as a design factor, a gas velocity of 100 fps? On average, how long will gas velocities remain at or above 100 fps during peak hour operations or "drafting" mode of operation on its pipeline? Explain.*

**Response 2**

- (a) The exact date of the implementation of the 100 fps limit is unknown but Algonquin believes that use of the 100 fps design criteria has been in place in excess of 30 years.
- (b) The average time gas velocities are above 100 feet per second during peak hour operations or the "drafting" mode of operation is zero.

**Algonquin Gas Transmission, LLC**  
**Docket No. CP14-96-000**  
**Response to Data Request Dated January 16, 2015**

## DATA REQUEST RESPONSE

3. *In its January 6th Response, Accufacts continues to claim that the 42-inch diameter pipeline loop, from the Stony Point to the Southeast Compressor Stations, is overbuilt for the claimed capacity needed for the Project. As a result, Accufacts contends that a new smaller diameter pipe could have been used to meet Algonquin's throughput and pressure requirements while raising the operating pressure in order to lower the "high" gas velocities. Discuss, in detail, if this approach was evaluated by Algonquin and why this approach was not used by Algonquin for the final design of the Project facilities as Accufacts claims.*

### Response 3

As noted in its December 23 Response, Algonquin also evaluated a new pipeline of a smaller diameter line and of a higher operating pressure. As described in that response and below, the use of smaller diameter pipeline results in a greater geographic area of environmental impacts and/or does not satisfy the AIM Project's purpose and need. Accufacts' response once again fails to take into account the length of the 42-inch diameter pipeline, which is an integral part of the overall design. Accordingly, Accufacts' proposal would require an increase in Project facilities, which would result in additional disturbance and impacted stakeholders.

Algonquin evaluated using a 36-inch diameter, 850 psig MAOP pipe during the development of the AIM Project facilities and determined that using smaller diameter pipeline would increase unnecessarily the length of lift and replacement. Specifically, with respect to the Stony Point to Southeast section, using smaller diameter pipeline would increase the length of the lift and replacement for such section by approximately 3.95 miles, or 33 percent. The additional length of pipeline would result in increased environmental, residential and stakeholder disturbance, including impacts to approximately 200 additional landowners. Furthermore, the 36-inch diameter pipeline would not lower the gas velocity in the remaining sections to Accufacts' unsupported proposal of 60 fps. In fact, if the length of the lift and replacement section remains the same as stated by Accufacts, the gas velocities in the remaining sections (the 30-inch section downstream of the 42-inch lift and replacement) would not change no matter what size is used for the lift and replacement section. Accordingly, Algonquin determined that using 36-inch diameter, 850 psig MAOP pipe was not a superior alternative.

Algonquin also evaluated using a 36-inch diameter, 1440 psig MAOP pipe. Algonquin determined that using a smaller diameter pipeline with a higher MAOP required an additional 40,000 horsepower at Stony Point Compressor Station, which would require the installation of four Solar Mars 100 units instead of the one Solar Mars 100 unit proposed in the AIM Project design, with additional environmental impact.<sup>2</sup> Moreover, the increased pressure would not lower the velocity in the remaining sections of 30-inch diameter and 26-inch diameter pipe

---

<sup>2</sup> Operating at 1440 psig (or any pressure above 850 psig) from the Stony Point Compressor Station also would require a complete station rebuild as the MAOP of the station is limited to 850 psig.

**Algonquin Gas Transmission, LLC**  
**Docket No. CP14-96-000**  
**Response to Data Request Dated January 16, 2015**

**DATA REQUEST RESPONSE**

below the 60 fps proposed by Accufacts. Specifically, the pressure decrease at the interconnection with the remaining 30-inch diameter and 26-inch diameter sections of the Algonquin system would be even greater than is proposed in the AIM Project design, which would mean that the additional compression required to operate the 36-inch diameter replacement pipeline at higher pressures could not be utilized for transportation on the existing 30-inch diameter and 26-inch diameter sections of pipeline, which are already at their MAOP, and effectively would be wasted. Based on these facts, Algonquin determined that using a 36-inch diameter, 1440 psig MAOP pipe also is not a superior alternative.

Finally, Algonquin evaluated using a 30-inch diameter, 850 psig MAOP pipe but determined that this smaller diameter pipeline would not satisfy the Project need. Even if Algonquin lifted and replaced the entire length of the Stony Point to Southeast segment with 30-inch diameter pipeline (28.9 miles), there would not be sufficient capacity on the Algonquin system to meet the current contracts and future obligations under the AIM Project. Thus, using a 30-inch diameter, 850 psig MAOP pipe is not a viable alternative.

In all of these scenarios using smaller diameter pipeline, Accufacts' claims also do not consider the portions of Algonquin's system that are not being modified. As the remaining 26-inch diameter and 30-inch diameter lines are already at their MAOP, the only way to lower the gas velocity in the remaining sections of those pipelines to meet Accufacts' proposed 60 fps limit is to replace segments of those pipelines with either higher MAOP or larger diameter pipe. These additional replacements would result in additional environmental, residential and stakeholder impacts.

**Algonquin Gas Transmission, LLC**  
**Docket No. CP14-96-000**  
**Response to Data Request Dated January 16, 2015**

## DATA REQUEST RESPONSE

4. *Accufacts continues to claim that Algonquin has this expansion project as part of an overall system upgrade. Accufacts believes that the individual subprojects should have been submitted as a greater overall application and that Algonquin is trying to avoid environmental requirements associated with that system upgrade. Discuss how Algonquin's design philosophy has incorporated its design to meet the requirements of the Project and if these facilities are part of an overall system upgrade.*

### Response 4

As reflected in Staff's data request, Accufacts is repeating claims that Algonquin already has addressed in its December 23 Response. As stated in the December 23 Response, the proposed AIM Project facilities are designed to satisfy existing and AIM Project capacity requirements and are not part of an overall system upgrade. Specifically, the AIM Project expands Algonquin's system by lifting and replacing 26-inch diameter pipe with 42-inch diameter, 850 psig MAOP pipe in the same way that Ramapo Project (CP06-76-000) was built on top of the system that was certificated and built before it. Algonquin's proposal and FERC Staff's draft environmental impact statement are in compliance with the National Environmental Policy Act and the regulations promulgated thereunder addressing the appropriate scope of environmental review.

Algonquin continues to design and build (as certificated by the FERC) to meet its customer's needs as well as minimize the disturbance to the stakeholders. Algonquin's proposal in the AIM Project minimizes such disturbance. Accufacts maintains that there is excess capacity in the 42-inch section. Any "excess" capacity created by the AIM Project is latent capacity, *i.e.*, it is not available without additional modifications to other facilities, similar to latent capacity created by the Ramapo Project when it went into service in 2008. Thus, Algonquin will only be able to access any such latent capacity created by the AIM Project by developing, designing, proposing and receiving FERC approval of a subsequent Project extending the 42-inch diameter pipe as necessary to meet the needs of such future Project shippers and any such FERC approval of a subsequent project would itself be subject to NEPA review.

This incremental expansion of pipeline systems is not unique to Algonquin, but, instead, is the FERC-approved industry standard that avoids the inefficient creation of additional capacity through new, greenfield construction. Any future expansion of the Algonquin system will build upon all the previous projects which resulted in the then existing system. The diameter of the pipeline installed for any current project is not the determining factor in whether or not a future expansion occurs. Such future expansion will depend upon market demands and certification by the FERC in compliance with the NEPA requirements.

Algonquin is not avoiding and will not avoid any environmental requirements associated with any system upgrade. As addressed in the December 23 Response, Accufacts' claim that

**Algonquin Gas Transmission, LLC**  
**Docket No. CP14-96-000**  
**Response to Data Request Dated January 16, 2015**

**DATA REQUEST RESPONSE**

Algonquin is inappropriately segmenting projects is without any legal or factual basis.<sup>3</sup> Algonquin has already addressed segmentation claims related to actual projects submitted in comments to the DEIS.<sup>4</sup> Gas velocities above the arbitrary 60 fps proposed by Accufacts do not, in and of themselves, suggest that further pipe replacement projects are either needed or forthcoming as Accufacts claims. Similarly, the alleged creation of so-called “excess capacity” alone does not cause any future projects to be undertaken, nor does it require FERC to analyze in the AIM Project EIS future, speculative projects that may or may not utilize any such excess capacity. *See Wilderness Workshop v. U.S. Bureau of Land Management*, 531 F.3d 1220, 1231 (10th Cir. 2008)(NEPA analysis for gas pipeline project need not address environmental impacts of possible future development even though pipeline capacity is greater than necessary for current needs). Further, the AIM Project Environmental Impact Statement will address the cumulative impacts of one potential future project, the Atlantic Bridge Project. In any future certificate proceeding addressing the Atlantic Bridge Project, or other system upgrade, the FERC Staff will prepare an environmental report addressing the environmental impacts of any proposed project, and the impacts from the AIM Project will be addressed as baseline conditions and cumulative impacts in such report, as relevant.

## II. Intervenors

- United States Congressman Stephen F. Lynch of District 8, who represents 732,884 residents according to the 2010 US Census
- Martin J. Walsh, the Mayor of Boston, represents 617,594 City of Boston residents according to the 2010 US Census
- Matt O'Malley, who is the District 6 Boston City Councilor, represents 71,130 residents according to the 2012 City of Boston data
- Boston City Councilors At-Large Michelle Wu, Michael Flaherty, Ayanna Pressley and Stephen Murphy, who represent the 617,594 City of Boston residents according to the 2010 US Census
- State Representative Edward F. Copping of the 10<sup>th</sup> Suffolk district of the Commonwealth of Massachusetts represents 42,147 residents according to the 2010 US Census
- State Senator Michael F. Rush, who represents the Suffolk and Norfolk Counties of the Commonwealth of Massachusetts, represents 155,993 residents according to the 2010 US Census

## III. Interest of Petitioners

The elected officials seek to intervene in order to ensure the public safety of their constituents as well as environmental concerns. Should this project proceed, the petitioners have the following concerns:

- Plans to build a high-pressure pipeline and Metering & Regulating (M&R) Station in a densely populated area of West Roxbury that is near an active blasting quarry is potentially dangerous
- Lack of consideration of viable alternative routes by Spectra and National Grid in spite of explicit requests from the elected officials, abutters and residents in the neighborhood, as well as other neighborhoods to find another route in a nonresidential area and not bordering an active quarry.
- The impact on the community in terms of overall safety and health that goes along with a high-pressure line
- The operation of a high-pressure pipeline and M&R Station in proximity to a vulnerable community which then increases the risk of exposure to hazardous air pollutants.

## IV. Conclusion

The Intervenors represent this community that has elected them to represent their best interests. We have considerable interest in protecting the environmental, public health and safety of the area in which

the West Roxbury Lateral pipeline and M&R Station are proposed to be built. No other party in this proceeding will be able to adequately protect these interests. Accordingly, the Intervenor has a direct and substantial interest in the outcome of this application process.

V. Motion to Intervene

Consequently, for all the reasons set forth above, the Intervenor respectfully request that this Motion to Intervene be granted and that Congressman Stephen F. Lynch, Mayor Martin J. Walsh, Boston City Councilor of District 6 Matt O'Malley, Boston City Councilors At-Large Michelle Wu, Ayanna Pressley, Michael Flaherty and Stephen J. Murphy as well as State Representative Edward F. Copping and State Senator Michael F. Rush be permitted to participate, with the full rights of a party, in the above-captioned proceedings before FERC and any and all further proceedings in regard to this project.

Respectfully Submitted,

Congressman Stephen F. Lynch

UNITED STATES OF AMERICA  
FEDERAL ENERGY REGULATORY COMMISSION

Algonquin Gas Transmission, LLC

Docket No. CP14-96-000

NOTICE OF AVAILABILITY OF THE  
FINAL ENVIRONMENTAL IMPACT STATEMENT FOR THE PROPOSED  
ALGONQUIN INCREMENTAL MARKET PROJECT

(January 23, 2015)

The staff of the Federal Energy Regulatory Commission (FERC or Commission) has prepared a final environmental impact statement (EIS) for the Algonquin Incremental Market Project (AIM Project), proposed by Algonquin Gas Transmission, LLC (Algonquin) in the above-referenced docket. Algonquin requests authorization to expand its existing pipeline system from an interconnection at Ramapo, New York to deliver up to 342,000 dekatherms per day of natural gas transportation service to the Connecticut, Rhode Island, and Massachusetts markets.

The final EIS assesses the potential environmental effects of the construction and operation of the AIM Project in accordance with the requirements of the National Environmental Policy Act (NEPA). The FERC staff concludes that approval of the proposed project would result in some adverse environmental impacts; however, most of these impacts would be reduced to less-than-significant levels with the implementation of Algonquin's proposed mitigation and the additional measures recommended in the final EIS.

The U.S. Environmental Protection Agency, the U.S. Army Corps of Engineers, and the U.S. Department of Transportation's Pipeline and Hazardous Materials Safety Administration participated as cooperating agencies in the preparation of the EIS. Cooperating agencies have jurisdiction by law or special expertise with respect to resources potentially affected by the proposal and participate in the NEPA analysis. Although the cooperating agencies provided input to the conclusions and recommendations presented in the final EIS, the agencies will present their own conclusions and recommendations in their respective records of decision or determinations for the AIM Project.

The final EIS addresses the potential environmental effects of the construction and operation of about 37.4 miles of pipeline composed of the following facilities:

- replacement of 26.3 miles of existing pipeline with a 16- and 42-inch-diameter pipeline;

- extension of an existing loop<sup>1</sup> pipeline with about 3.3 miles of additional 12- and 36-inch-diameter pipeline within Algonquin's existing right-of-way; and
- installation of about 7.8 miles of new 16-, 24-, and 42-inch-diameter pipeline.

The AIM Project's proposed aboveground facilities consist of modifications to six existing compressor stations, to add a total 81,620 horsepower, in New York, Connecticut, and Rhode Island. Algonquin also proposes to abandon four existing compressor units for a total of 10,800 horsepower at one compressor station in New York.

The FERC staff mailed copies of the final EIS to federal, state, and local government representatives and agencies; elected officials; environmental and public interest groups; Native American tribes; potentially affected landowners and other interested individuals and groups; newspapers and libraries in the area of the project; and parties to this proceeding. Paper copy versions of this final EIS were mailed to those specifically requesting them; all others received a CD version. However, we note that due to its voluminous size, the comment responses are provided as an electronic-only volume (Volume II) on a CD that was mailed to the entire mailing list. In addition, the final EIS is available for public viewing on the FERC's website ([www.ferc.gov](http://www.ferc.gov)) using the eLibrary link. A limited number of copies are available for distribution and public inspection at:

Federal Energy Regulatory Commission  
Public Reference Room  
888 First Street NE, Room 2A  
Washington, DC 20426  
(202) 502-8371

In accordance with the Council on Environmental Quality's (CEQ) regulations implementing the NEPA, no agency decision on a proposed action may be made until 30 days after the U.S. Environmental Protection Agency publishes a notice of availability of a final EIS. However, the CEQ regulations provide an exception to this rule when an agency decision is subject to a formal internal appeal process that allows other agencies or the public to make their views known. In such cases, an agency decision may be made at the same time the notice of the final EIS is published, allowing both periods to run concurrently. The Commission decision for this proposed action is subject to a 30-day rehearing period.

Additional information about the proposed project is available from the Commission's Office of External Affairs, at **(866) 208-FERC**, or on the FERC website ([www.ferc.gov](http://www.ferc.gov)) using the eLibrary link. Click on the eLibrary link, click on "General

Algonquin Gas Transmission, LLC  
Docket No. CP14-96-000  
FERC/EIS-0254F

TO THE PARTY ADDRESSED:

The staff of the Federal Energy Regulatory Commission (FERC or Commission) has prepared a final environmental impact statement (EIS) for the Algonquin Incremental Market Project (AIM Project), proposed by Algonquin Gas Transmission, LLC (Algonquin) in the above-referenced docket. Algonquin requests authorization to expand its existing pipeline system from an interconnection at Ramapo, New York to deliver up to 342,000 dekatherms per day of natural gas transportation service to the Connecticut, Rhode Island, and Massachusetts markets.

The final EIS assesses the potential environmental effects of the construction and operation of the AIM Project in accordance with the requirements of the National Environmental Policy Act (NEPA). The FERC staff concludes that approval of the proposed project would result in some adverse environmental impacts; however, most of these impacts would be reduced to less-than-significant levels with the implementation of Algonquin's proposed mitigation and the additional measures recommended in the final EIS.

The U.S. Environmental Protection Agency, the U.S. Army Corps of Engineers, and the U.S. Department of Transportation's Pipeline and Hazardous Materials Safety Administration participated as cooperating agencies in the preparation of the EIS. Cooperating agencies have jurisdiction by law or special expertise with respect to resources potentially affected by the proposal and participate in the NEPA analysis. Although the cooperating agencies provided input to the conclusions and recommendations presented in the final EIS, the agencies will present their own conclusions and recommendations in their respective records of decision or determinations for the AIM Project.

The final EIS addresses the potential environmental effects of the construction and operation of about 37.4 miles of pipeline composed of the following facilities:

- replacement of 26.3 miles of existing pipeline with a 16- and 42-inch-diameter pipeline;

- extension of an existing loop <sup>1</sup> pipeline with about 3.3 miles of additional 12- and 36-inch-diameter pipeline within Algonquin's existing right-of-way; and
- installation of about 7.8 miles of new 16-, 24-, and 42-inch-diameter pipeline.

The AIM Project's proposed aboveground facilities consist of modifications to six existing compressor stations, to add a total 81,620 horsepower, in New York, Connecticut, and Rhode Island. Algonquin also proposes to abandon four existing compressor units for a total of 10,800 horsepower at one compressor station in New York.

The FERC staff mailed copies of the final EIS to federal, state, and local government representatives and agencies; elected officials; environmental and public interest groups; Native American tribes; potentially affected landowners and other interested individuals and groups; newspapers and libraries in the area of the project; and parties to this proceeding. Paper copy versions of this final EIS were mailed to those specifically requesting them; all others received a CD version. However, we note that due to its voluminous size, the comment responses are provided as an electronic-only volume (Volume II) on a CD that was mailed to the entire mailing list. In addition, the final EIS is available for public viewing on the FERC's website ([www.ferc.gov](http://www.ferc.gov)) using the eLibrary link. A limited number of copies are available for distribution and public inspection at:

Federal Energy Regulatory Commission  
Public Reference Room  
888 First Street NE, Room 2A  
Washington, DC 20426  
(202) 502-8371

In accordance with the Council on Environmental Quality's (CEQ) regulations implementing the NEPA, no agency decision on a proposed action may be made until 30 days after the U.S. Environmental Protection Agency publishes a notice of availability of a final EIS. However, the CEQ regulations provide an exception to this rule when an agency decision is subject to a formal internal appeal process that allows other agencies or the public to make their views known. In such cases, an agency decision may be made at the same time the notice of the final EIS is published, allowing both periods to run concurrently. The Commission decision for this proposed action is subject to a 30-day rehearing period.

Additional information about the proposed project is available from the Commission's Office of External Affairs, at **(866) 208-FERC**, or on the FERC website

4.7.1.1 Species Under NOAA Fisheries Jurisdiction .....	4-110
4.7.1.2 Species under FWS Jurisdiction .....	4-111
4.7.1.3 Federal Candidate and Proposed Species .....	4-115
4.7.2 Migratory Birds.....	4-116
4.7.3 Bald Eagles .....	4-118
4.7.4 Marine Mammals .....	4-119
4.7.5 State-listed Species .....	4-119
4.7.5.1 New York .....	4-123
4.7.5.2 Connecticut.....	4-125
4.7.5.3 Rhode Island.....	4-132
4.7.5.4 Massachusetts.....	4-132
4.8 LAND USE, RECREATION, SPECIAL INTEREST AREAS, AND VISUAL RESOURCES .....	4-132
4.8.1 Land Use.....	4-132
4.8.1.1 Environmental Setting .....	4-132
4.8.1.2 Pipeline Facilities .....	4-138
4.8.1.3 Aboveground Facilities .....	4-139
4.8.1.4 Pipe and Contractor Ware Yards .....	4-142
4.8.1.5 Access Roads.....	4-142
4.8.2 Land Ownership and Easement Requirements .....	4-142
4.8.3 Existing Residences, Commercial and Industrial Facilities, and Planned Developments .....	4-143
4.8.3.1 Existing Residences and Commercial and Industrial Facilities.....	4-143
4.8.3.2 Planned Developments .....	4-146
4.8.4 Coastal Zone Management .....	4-153
4.8.4.1 New York .....	4-154
4.8.4.2 Massachusetts.....	4-154
4.8.5 Public Land, Recreation, and Other Special Interest Areas.....	4-154
4.8.5.1 New York .....	4-155
4.8.5.2 Connecticut.....	4-164
4.8.5.3 Massachusetts.....	4-167
4.8.6 Hazardous Waste Sites and Polychlorinated Biphenyls .....	4-171
4.8.6.1 Hazardous Waste Sites and Landfills .....	4-171
4.8.6.2 Polychlorinated Biphenyls.....	4-171
4.8.7 Visual Resources.....	4-173
4.8.7.1 Pipeline Facilities .....	4-173
4.8.7.2 Aboveground Facilities .....	4-173
4.8.7.3 Pipe and Contractor Ware Yards .....	4-174
4.8.7.4 Access Roads.....	4-174

## TABLE OF CONTENTS (cont'd)

## LIST OF APPENDICES

### **VOLUME I**

Appendix B	Facility Location Maps and Typical Right-of-Way Configurations
Appendix C	Additional Temporary Workspace Table
Appendix D	Proposed Construction Techniques by Milepost Table
Appendix E	Rock Removal Plan
Appendix F	Public Road and Railroad Crossing Table
Appendix G	Traffic Management Plans
Appendix H	Residences and Other Structures Within 50 feet of the Construction Work Area and Residential Construction Plans
Appendix I	Waterbody Crossings
Appendix J	Site-specific HDD Crossing Plans and Best Drilling Practices, Monitoring, and Clean-up of Horizontal Directional Drilling Inadvertent Returns Plan
Appendix K	Wetland Crossings
Appendix L	Bedrock Geology Tables
Appendix M	Final Wetland Mitigation Plan
Appendix N	Common Wildlife Species Often Associated with the Vegetative Cover Types Found Within the Project Area
Appendix O	Migratory Bird Priority Species and Associated Habitats Potentially Located Within the AIM Project Area
Appendix P	Public Lands, Recreation, and Special Interest Areas Crossed by or Within 0.25 Mile of the Project Area
Appendix Q	Signalized Intersection Capacity Analysis for Key Intersections Within the AIM Project Area in Massachusetts
Appendix R	Consultations With Federally Recognized Indian Tribes
Appendix S	References and Contacts
Appendix T	List of Preparers
Appendix U	Subject Index

### **VOLUME II – CD ONLY**

Responses to Comments on the Draft Environmental Impact Statement

Appendix A	Distribution List
------------	-------------------

## ACRONYMS AND ABBREVIATIONS

AAQS	ambient air quality standards
AC/DC	alternating current/direct current
ACHP	Advisory Council on Historic Preservation
AIM Project	Algonquin Incremental Market Project
Algonquin	Algonquin Gas Transmission, LLC
APA	Aquifer Protection Areas
APE	Area of Potential Effect
AQCR	Air quality control region
ATWS	additional temporary workspace
BA	biological assessment
Bay State	Bay State Gas Company d/b/a Columbia Gas of Massachusetts, Inc.
BCA	Bird Conservation Area
BCC	Birds of Conservation Concern
bcf/d	billion cubic feet per day
BCR	Bird Conservation Region
BDP Plan	Best Drilling Practices Plan
BGEPA	Bald and Golden Eagle Protection Act
BMP	best management practices
BNAN	Boston Natural Areas Network
BO	Biological Opinion
Boston Gas	Boston Gas Company d/b/a National Grid
CAA	Clean Air Act
CEAs	critical environmental areas
CEQ	Council on Environmental Quality
Certificate	Certificate of Public Convenience and Necessity
CES	Comprehensive Energy Strategy
CFR	Code of Federal Regulations
CGS	Connecticut General Statutes
CH <sub>4</sub>	methane
CHPE	Champlain Hudson Power Express
CMR	Code of Massachusetts Regulations
CO	carbon monoxide
CO <sub>2</sub>	carbon dioxide
CO <sub>2</sub> e	carbon dioxide equivalents
Colonial Gas	Colonial Gas Company d/b/a National Grid
Commission	Federal Energy Regulatory Commission
Connecticut Natural Gas	Connecticut Natural Gas Corporation
CTDEEP	Connecticut Department of Energy and Environmental Protection

## ACRONYMS AND ABBREVIATIONS (cont'd)

CWA	Clean Water Act
CWRMP	Compensatory Wetland Restoration and Mitigation Plan
CZMA	Coastal Zone Management Act of 1972
CZMP	coastal zone management program
dB	decibels
dBA	decibels on the A-weighted scale
DOE	U.S. Department of Energy
DOE/EIA	U.S. Department of Energy's Energy Information Administration
DPS	distinct population segment
DPW	Department of Public Works
Dth/d	dekatherms per day
E&SCP	Erosion and Sediment Control Plan
EDR	Environmental Data Resources, Inc.
EFH	Essential Fish Habitat
EI	Environmental Inspector
EIS	environmental impact statement
Entergy	Entergy Nuclear Operations, Inc.
EO	Executive Order
EPA	U.S. Environmental Protection Agency
EPAct	Energy Policy Act of 2005
ESA	Endangered Species Act of 1973
FERC	Federal Energy Regulatory Commission
FWS	U.S. Fish and Wildlife Service
g	gravity
GHGs	greenhouse gases
GIS	Geographic Information System
GW	gigawatt
GWh	gigawatt hours
GWP	global warming potential
GZA	GeoEnvironmental, Inc.
HAP	Hazardous Air Pollutant
HCA	high consequence area
HDD	horizontal directional drill
HMM	Hatch Mott MacDonald, LLC
hp	horsepower
HPU	hydraulic power unit
IBA	Important Bird Area
IPCC	Intergovernmental Panel on Climate Change
IPEC	Indian Point Energy Center

## ACRONYMS AND ABBREVIATIONS (cont'd)

Iroquois	Iroquois Gas Transmission
IWWC	inland wetlands and watercourse agencies
kW	kilowatt
L <sub>90</sub>	lowest background A-weighted sound level that is exceeded 90 percent of the time
LDCs	local distribution companies
L <sub>dn</sub>	day-night sound level
L <sub>eq</sub>	24-hour equivalent sound level
LNG	liquefied natural gas
LOS	current level of service
LWRP	Local Waterfront Revitalization Program
M&R	metering and regulating
MACZM	Massachusetts Office of Coastal Zone Management
MADCR	Massachusetts Department of Conservation and Recreation
MAEFSB	Massachusetts Energy Facilities Siting Board
MAEOEEA	Massachusetts Executive Office of Energy and Environmental Affairs
MAOP	maximum allowable operating pressure
MassDEP	Massachusetts Department of Environmental Protection
MassDOT	Massachusetts Department of Transportation
MassGIS	Massachusetts Geographic Information System
m <sub>bLg</sub>	short-period body-wave magnitude
MBTA	Migratory Bird Treaty Act
MBTA MOU	Memorandum of Understanding Between the Federal Energy Regulatory Commission and the U.S. Department of the Interior United States Fish and Wildlife Service Regarding Implementation of Executive Order 13186, "Responsibilities of Federal Agencies to Protect Migratory Birds"
MDFW	Massachusetts Division of Fisheries and Wildlife
MECC	Massachusetts Electric Construction Company
Memorandum	Memorandum of Understanding on Natural Gas Transportation
MIPAG	Massachusetts Invasive Plant Advisory Group
MLR	mainline regulators
MLV	mainline valve
MMBtu	million metric British thermal units
MMBtu/hr	million metric British thermal units per hour
MMPA	Marine Mammal Protection Act
MNHESP	Massachusetts Natural Heritage and Endangered Species Program
MP	milepost
MSA	Magnuson-Stevens Fishery Conservation and Management Act
msl	mean sea level
MW	megawatt

## ACRONYMS AND ABBREVIATIONS (cont'd)

MWh	megawatt hours
N <sub>2</sub> O	nitrous oxide
NAAQS	national ambient air quality standards
Narragansett Electric	The Narragansett Electric Company d/b/a National Grid
NEPA	National Environmental Policy Act
NESHAP	National Emission Standards for Hazardous Air Pollutants
NGA	Natural Gas Act
NHPA	National Historic Preservation Act
NHT	National Historic Trail
NNSR	Nonattainment New Source Review
NO <sub>2</sub>	nitrogen dioxide
NOAA Fisheries	National Oceanic and Atmospheric Administration, National Marine Fisheries Service
NOI	Notice of Intent to Prepare an Environmental Impact Statement for the Planned Algonquin Incremental Market Project, Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings
NO <sub>x</sub>	nitrogen oxides
NPDES	National Pollutant Discharge Elimination System
NPS	National Park Service
NPU	Norwich Public Utilities
NRC	U.S. Nuclear Regulatory Commission
NRCS	Natural Resources Conservation Service
NRHP	National Register of Historic Places
NRI	National Rivers Inventory
NSA	noise-sensitive area
NSPS	New Source Performance Standards
NSR	New Source Review
NSTAR	NSTAR Gas Company
NWI	National Wetlands Inventory
NYCDEP	New York City Department of Environmental Protection
NYCRR	New York Codes, Rules and Regulations
NYNHP	New York Natural Heritage Program
NYSDEC	New York State Department of Environmental Conservation
NYSDOH	New York State Department of Health
NYSDOS	New York State Department of State
NYSDOT	New York State Department of Transportation
NYSOPRHP	New York State Office of Parks, Recreation and Historic Preservation
NYSPSC	New York State Public Service Commission
OCRM	NOAA, Office of Ocean and Coastal Resource Management
OEP	Office of Energy Projects

## ACRONYMS AND ABBREVIATIONS (cont'd)

OPS	Office of Pipeline Safety
ORW	Outstanding Resource Waters
OSHA	Occupational Safety and Health Administration
PAR	permanent access roads
PCB	polychlorinated biphenyl
pCi/L	picocuries per liter
PEM	palustrine emergent
PFO	palustrine forested
PGA	peak ground acceleration
PHMSA	Pipeline and Hazardous Materials Safety Administration
PIPC	Palisades Interstate Park Commission
Plan	Upland Erosion Control, Revegetation, and Maintenance Plan
PM	particulate matter
PM <sub>10</sub>	particulate matter less than 10 microns in aerodynamic diameter
PM <sub>2.5</sub>	particulate matter less than 2.5 microns in aerodynamic diameter
PNHP	Pennsylvania Natural Heritage Program
Primary Aquifers	Primary Water Supply Aquifers
Procedures	Wetland and Waterbody Construction and Mitigation Procedures
Project	Algonquin Incremental Market Project
PSD	Prevention of Significant Deterioration
PSS	palustrine scrub-shrub
PTE	potential-to-emit
RCSA	Regulation of Connecticut State Agencies
RHA	Rivers and Harbors Act
RICE	reciprocating internal combustion engines
RIDEM	Rhode Island Department of Environmental Management
RQD	rock quality designation
SCFWH	Significant Coastal Fish and Wildlife Habitat
SDWA	Safe Drinking Water Act
Secretary	Secretary of the Commission
SHPO	State Historic Preservation Office
SIP	State Implementation Plan
SO <sub>2</sub>	sulfur dioxide
SOP	standard operating procedure
Southern Connecticut	The Southern Connecticut Gas Company
SPCC Plan	Spill Prevention Control and Countermeasure Plan/Preparedness, Prevention, and Contingency Plan for the Algonquin Incremental Market Project
SPDES	State Pollution Discharge Elimination System
Spectra	Spectra Energy Corporation

## ACRONYMS AND ABBREVIATIONS (cont'd)

SPL	sound pressure level
SSA	sole or principal source aquifer
SSURGO	Soil Survey Geographic Database
SWAP	Source Water Assessment Program
SWPPP	Stormwater Pollution Prevention Plan
TAR	temporary access roads
Tennessee	Tennessee Gas Pipeline
TSA	Office of Homeland Security's Transportation Safety Administration
TTC	temporary traffic control
USACE	U.S. Army Corps of Engineers
USET	United South and Eastern Tribes Inc.
USC	United States Code
USDA	U.S. Department of Agriculture
USGCRP	U.S. Global Change Research Program
USGS	U.S. Geological Survey
USN	unique site number
VOC	volatile organic compound
WEG	wind erodibility group
WPP	West Point Partners
WPT	West Point Transmission
WQC	Water Quality Certification
Yankee Gas	Yankee Gas Services Company

# EXECUTIVE SUMMARY

---

## INTRODUCTION

The staff of the Federal Energy Regulatory Commission (FERC or Commission) has prepared this final Environmental Impact Statement (EIS) to fulfill requirements of the National Environmental Policy Act of 1969 and the Commission's implementing regulations under Title 18 of the Code of Federal Regulations (CFR) Part 380. On February 28, 2014, Algonquin Gas Transmission, LLC (Algonquin) filed an application with FERC under sections 7(b) and (c) of the Natural Gas Act, as amended, and Part 157 of the Commission's regulations to construct, abandon, install, own, operate, and maintain expansions of its existing interstate natural gas pipeline systems in New York, Connecticut, Rhode Island, and Massachusetts. This project is referred to as the Algonquin Incremental Market Project (AIM Project or Project). The purpose of this document is to inform the public and federal and state agencies about the potential environmental impacts of the Project and its alternatives, and to recommend appropriate mitigation that would avoid or reduce adverse impacts.

The FERC is the federal agency responsible for authorizing interstate natural gas transmission facilities under the Natural Gas Act, and is the lead federal agency for the preparation of this EIS in compliance with the requirements of the National Environmental Policy Act. The U.S. Environmental Protection Agency, the U.S. Army Corps of Engineers (USACE), and the U.S. Department of Transportation's Pipeline and Hazardous Materials Safety Administration, participated as cooperating agencies in the preparation of the EIS. A cooperating agency has jurisdiction by law or has special expertise with respect to environmental resource issues associated with a project.

## PROPOSED ACTION

The Project would involve the construction and operation of about 37.4 miles of natural gas pipeline and associated equipment and facilities in New York, Connecticut, and Massachusetts. The majority of the pipeline facilities (about 26.3 miles or 70 percent of the total 37.4 miles) would replace existing Algonquin pipelines, while the remainder of the pipeline facilities (about 11.1 miles or 30 percent) consists of new mainline pipeline, new loop pipeline, and one new lateral pipeline. In addition to the pipeline facilities, Algonquin would modify 6 existing compressor stations and 24 existing metering and regulating (M&R) stations; construct 3 new M&R stations; and remove an existing M&R station. Modifications to the six existing compressor stations include the installation of 81,620 total horsepower (hp) in New York, Connecticut, and Rhode Island. Algonquin also proposes to abandon four existing compressor units for a total of 10,800 hp at one compressor station in New York. Algonquin would also modify three existing mainline valve (MLV) sites and five existing pig<sup>1</sup> launcher/receiver sites, construct five new launcher/receiver sites, construct new MLV cross over piping at two locations, and construct a new MLV. Mainline regulation facilities would also be added at the terminus of one of the pipeline segments in New York.

According to Algonquin, the purpose of the AIM Project is to expand its existing pipeline system from an interconnection at Ramapo, New York to deliver up to 342,000 dekatherms per day of natural gas transportation service to the Connecticut, Rhode Island, and Massachusetts markets. Algonquin's stated objectives for the Project are:

- to provide the pipeline capacity necessary to transport additional natural gas supplies to meet the immediate and future load growth demands of local gas utilities in southern New England;

---

<sup>1</sup> A pipeline "pig" is a device to clean or inspect the pipeline. A pig launcher/receiver is an aboveground facility where pigs are inserted or retrieved from the pipeline.

- eliminate capacity constraints on existing pipeline systems in New York State and southern New England;
- provide access to growing natural gas supply areas in the Northeast region to increase competition and reduce volatility in natural gas pricing in southern New England; and
- improve existing compressor station emissions through the replacement of existing compressor units with new, efficient units.

## PUBLIC INVOLVEMENT

On June 18, 2013, Algonquin filed a request with the FERC to implement the Commission's pre-filing process for its Project. At that time, Algonquin was in the preliminary design stage of its Project and no formal application had been filed. The purpose of the pre-filing process is to encourage the early involvement of interested stakeholders, facilitate interagency cooperation, and identify and resolve issues before an application is filed with the FERC. On June 28, 2013, the FERC granted Algonquin's request and established a pre-filing docket number (PF13-16-000) to place information related to the Project into the public record. The cooperating agencies agreed to conduct their environmental reviews of the Project in conjunction with the Commission's environmental process.

On September 13, 2013, the FERC issued a *Notice of Intent to Prepare an Environmental Impact Statement for the Planned Algonquin Incremental Market Project, Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings* (NOI). The NOI was published in the Federal Register on September 19, 2013, and copies were mailed to over 1,800 parties, including representatives of federal, state, and local agencies; elected officials; environmental and public interest groups; Native American tribes; potentially affected landowners; other interested parties; and local libraries and newspapers. The FERC staff continued to receive and consider comments during the entire pre-filing period and throughout the development of this EIS. We<sup>2</sup> held four public scoping meetings in the AIM Project area to solicit and receive comments on environmental issues associated with this Project. The meetings were held September 30, 2013 through October 3, 2013 in the Town of Cortlandt, New York; Danbury and Norwich, Connecticut; and the Town of Dedham, Massachusetts.

Additionally, we participated in Algonquin's open houses, interagency meetings, conference calls, and site visits for the AIM Project to identify issues to be addressed in this EIS. The meetings, conference calls, and site visits provided a forum for the exchange of information and supported the FERC's responsibility to coordinate federal authorizations and associated environmental review of the AIM Project.

On August 6, 2014, we issued a *Notice of Availability of the Draft Environmental Impact Statement for the Proposed Algonquin Incremental Market Project*. This notice, which was published in the Federal Register, listed the dates and locations of public comment meetings and established a closing date of September 29, 2014 for receiving comments on the draft EIS. Copies of the draft EIS were mailed to over 2,740 stakeholders. The EPA noticed receipt of the draft EIS in the Federal Register on August 15, 2014.

We held five public comment meetings in the AIM Project area to solicit and receive comments on the draft EIS. The meetings were held between September 8 and 16, 2014 in the Town of Dedham, Massachusetts; Norwich, Connecticut; Danbury, Connecticut; the Town of Cortlandt, New York; and the Town of Mapleville, Rhode Island. The meetings provided the public an opportunity to present oral

---

<sup>2</sup> The pronouns "we," "us," and "our" refer to the environmental staff of the FERC's Office of Energy Projects.

comments on the analysis of environmental impacts described in the draft EIS. This final EIS addresses all substantive comments submitted to the FERC or received at the open houses, scoping meetings, interagency meetings, and comment meetings on the draft EIS.

## **PROJECT IMPACTS AND MITIGATION**

Construction and operation of the Project could result in numerous impacts on the environment. We evaluated the impacts of the Project, taking into consideration Algonquin's proposed mitigation measures, on geology, soils, groundwater, surface water, wetlands, vegetation, wildlife, fisheries, special status species, land use, recreation, visual resources, socioeconomics, cultural resources, air quality, noise, and safety and reliability. Where necessary, we are recommending additional mitigation to minimize or avoid these impacts. Cumulative impacts of this Project with other past, present, and reasonably foreseeable actions in the Project area were also assessed. In section 3 of this EIS, we summarize the evaluation of alternatives to the Project, including the No Action Alternative, energy alternatives, system alternatives, facility design and siting alternatives, route alternatives and variations, and aboveground facility siting alternatives.

Based on scoping comments, comments on the draft EIS, agency consultations, and our independent evaluation of resource impacts, the major issues identified in our analysis are in regard to blasting impacts, waterbody crossings, wetlands, special status species, land use and recreation, traffic impacts, safety, and alternatives. Our analysis of these issues is summarized below and is discussed in detail in the appropriate resource sections in sections 3 and 4 of this EIS. Sections 5.1 and 5.2 of this EIS contain our conclusions and a compilation of our recommended mitigation measures, respectively.

The potential for geologic hazards, including seismic events, to significantly affect construction or operation of the proposed Project facilities is low. The U.S. Geological Survey has extensively studied the Ramapo Fault system and the level of seismicity in the region. The U.S. Geological Survey's review of data indicates that there is no clear association between the fault and small earthquakes that do occur in the region. Further, there is insufficient geologic evidence to indicate the existence of a tectonic fault or Holocene-age slip or deformation associated with the fault. In any case, the design of the pipeline takes into consideration site-specific conditions, including earthquakes. The recorded magnitude of earthquakes in the Project area is relatively low and the ground vibration would not pose a problem for a modern welded-steel pipeline.

The pipeline segments would traverse about 7.2 miles of shallow bedrock that may require blasting. In order to minimize potential impacts from blasting, Algonquin would comply with all federal, state, and local regulations for blasting and has developed an acceptable Rock Removal Plan to be used during construction.

Existing soil contamination could be encountered during construction. Algonquin has developed an Unexpected Contamination Encounter Procedures to address the measures it would implement if contaminated soils are crossed during construction. To-date, Algonquin has also determined that field sampling would be required at two locations (one in Connecticut and one in Massachusetts). However, the Connecticut Department of Energy and Environmental Protection (CTDEEP) also identified a concern at a third site. We are recommending that prior to construction, Algonquin develop a Field Sampling Plan for these and any other potential contaminated sites that could be encountered during construction.

The Project would cross 102 waterbodies, including 36 perennial streams, 62 intermittent streams, 3 ephemeral streams, and a ponded area. Algonquin proposes to use a dry crossing method (i.e., flume or dam-and-pump) to install all but two of the waterbody crossings. The other two waterbodies would be crossed using the horizontal directional drill (HDD) method (Hudson and Still Rivers). Dry

crossing methods typically result in lower sedimentation and associated turbidity impacts when compared to conventional wet crossing methods.

The Project would cross the Hudson River in New York and the Still River in Connecticut using the HDD method. Algonquin performed geotechnical feasibility studies at the proposed HDD sites and developed site-specific crossing plans for both of the crossings. Algonquin has also developed a Best Drilling Practices, Monitoring, and Clean-up of Horizontal Directional Drilling Inadvertent Returns Plan (BDP Plan) that describes the measures that would be taken to minimize the potential for inadvertent returns and releases at these two locations. Algonquin's implementation of the HDD method at the Hudson and Still Rivers would avoid in-stream disturbance of these waterbodies.

Several comments were received about the Project's potential to impact the watersheds that supply water to the New York City metropolitan area, including the Croton, the Catskill, and the Delaware Water Supply Systems. At the Catskill Aqueduct crossing, Algonquin would remove its existing 26-inch-diameter pipeline and casing, but not disturb the existing protective concrete slab, pending concurrence from the New York City Department of Environmental Protection. Algonquin would build the proposed 42-inch-diameter pipeline above the aqueduct at a 50-foot offset from the existing line. This offset would provide sufficient vertical clearance between the new pipeline and the Catskill Aqueduct. Algonquin is consulting with the New York City Department of Environmental Protection to develop a final crossing plan for the Catskill Aqueduct. Construction activities would be conducted in accordance with Algonquin's Erosion and Sediment Control Plan (E&SCP), Spill Prevention Control and Countermeasure Plan, Unexpected Contamination Encounters Procedures, Rock Removal Plan, BDP Plan, and construction stormwater plans and permits. With these protection measures in place, construction and operation of the Project would not result in significant impacts on surface water resources, including the Croton, Catskill, and Delaware water supply systems.

Construction of the Project would impact 52.5 acres of wetlands, about 23.9 acres in New York and 28.6 in Connecticut. Of the total wetland acreage, about 35.5 acres (67 percent) would involve herbaceous and shrub-scrub wetlands, and the remaining 17.0 acres (33 percent) would involve forested wetlands. About 2.4 acres of the forested wetlands would be permanently converted to non-forested wetlands during operation of the pipeline facilities. The remaining 14.6 acres of forested wetlands would eventually revert to preconstruction conditions following construction. The Project would not result in any permanent loss of wetlands. In addition, two vernal pools would be located within the temporary construction area for the Project facilities in New York.

Construction and operation-related impacts on wetlands and vernal pools would be mitigated by implementing the wetland protection and restoration measures contained in Algonquin's E&SCP, Invasive Plant Species Control Plan, and any additional conditions of the wetland permits that could be issued by the USACE, New York State Department of Environmental Conservation (NYSDEC), and CTDEEP. Algonquin proposes to provide compensatory mitigation for the permanent conversion of forested wetlands to a non-forested wetland type. Algonquin's implementation of a final, agency-approved Wetland Mitigation Plan would further offset any adverse impacts on wetland functions that would result from the permanent conversion of these wetlands. The USACE, NYSDEC, and CTDEEP would review and incorporate the final plan into Project permits. We are recommending that Algonquin identify any additional avoidance or mitigation measures for the two vernal pools through the permit review process with the applicable agencies, prior to construction.

Impacts on vegetation from the proposed Project would range from short-term to permanent due to the varied amount of time required to reestablish certain community types, as well as the maintenance of grassy vegetation within the permanent right-of-way and the conversion of aboveground facility locations to non-vegetated areas. Construction of the proposed Project facilities would temporarily

disturb about 352.4 acres of vegetation (160.9 acres of open land and 191.5 acres of forested vegetation) and permanently affect 34.7 acres (7.7 acres of open land and 27.0 acres of forested vegetation). The Project would also affect vegetation communities of special concern, including chestnut oak forests. Algonquin would limit the amount of disturbance to chestnut oak forests by utilizing the existing pipeline right-of-way during construction to the extent possible. Overall, the Project would not contribute significantly to new forest fragmentation because the proposed pipeline routes are located along existing rights-of-way and in areas that are already developed and highly fragmented.

The Project would affect wildlife and wildlife habitats, including migratory birds, along the pipeline route and at the aboveground facilities. Algonquin has minimized potential effects on significant or sensitive wildlife habitats by locating the majority of pipeline facilities within or adjacent to existing rights-of-way to the maximum extent possible. Algonquin would also use the HDD crossing method at the Hudson River crossing to avoid direct effects to the Hudson River Important Bird Area, aquatic habitats, and adjacent riparian habitats. Algonquin would implement its E&SCP and any permit conditions developed through consultation with the applicable federal and state agencies to minimize the effects of the Project on wildlife and their habitats. We find that these measures would minimize the effects of the Project on wildlife, including birds of conservation concern and other migratory birds. The U.S. Fish and Wildlife Service (FWS) confirmed that Algonquin's proposed measures are sufficient for minimizing impacts on migratory birds, and consultation for migratory birds protected under the Migratory Bird Treaty Act is complete.

Thirty of the Project waterbody crossings support fisheries of special concern. Eight waterbodies are waters with naturally occurring spawning populations of trout. One waterbody (the Hudson River) contains threatened and endangered species and anadromous fisheries. Implementation of Algonquin's construction, restoration, and mitigation procedures would result in only limited, short-term impacts on fishery resources, and the aquatic habitats upon which these fishery resources depend. Invertebrate populations would recolonize the crossing area and all temporary construction workspace areas would revert to their original condition, including re-establishment of riparian cover. Furthermore, operation and routine maintenance of the pipeline rights-of-way are not expected to have any noticeable impact on fishery resources in the Project area.

Through consultation with National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NOAA Fisheries), we have determined that the only waterbody crossing where essential fish habitat species could potentially occur is the Hudson River. Given the proposed use of the HDD construction method and the fact that no water would be withdrawn from the Hudson River to support Project construction, we conclude that the Project would have minimal, if any, adverse effects on essential fish habitat or managed species. NOAA Fisheries has concurred with this assessment. We have also determined that the Project would have no effect on marine mammals protected under the Marine Mammal Protection Act because they are not anticipated to occur within the Project area of the Hudson River.

Based on Algonquin's consultations with NOAA Fisheries and the FWS and our review of existing records, nine federally listed threatened or endangered species are potentially present in the vicinity of the Project (as well as one candidate species and one species proposed for listing as endangered). Based on these consultations, we determined that the AIM Project would have *no effect* on the shortnose sturgeon, Atlantic sturgeon, piping plover, roseate tern, Puritan tiger beetle, northern red-bellied cooter, and small whorled pogonia; *may affect, but would not likely adversely affect* the bog turtle and Indiana bat; *would not likely jeopardize the continued existence* of the northern long-eared bat; and *would not contribute to a trend toward federal listing* of the New England cottontail. NOAA Fisheries concurred with this determination for the Atlantic and shortnose sturgeon and consultation is complete for these species. The FWS has concurred with this determination for the piping plover, roseate tern, Puritan

tiger beetle, northern red-bellied cooter, small whorled pogonia, bog turtle, Indiana bat, northern long-eared bat, and the New England cottontail, and consultation is complete for these species as well. Algonquin is also continuing to consult with the NYSDEC and CTDEEP regarding impacts on state-listed species. No state-listed species would be affected in Rhode Island or Massachusetts.

Algonquin conducted bald eagle surveys for the Hudson River crossing area and identified wintering eagles. No bald eagle nests were observed in the Project area or within 0.5 mile of the Project. We have concluded, and the FWS concurs, that the Project would not result in harm to bald eagles. Algonquin continues to consult with the NYSDEC to discuss survey results and state-level concerns for bald eagles, and develop and implement any state-level avoidance and mitigation measures, including timing restrictions, as necessary, to avoid impacts on bald eagles.

Construction of the Project would impact about 575.6 acres. About 78 percent of this acreage would be utilized for the pipeline facilities. The remaining acreage impacted during construction would be associated with aboveground facilities (16 percent), pipe and contractor ware yards (5 percent), and access roads (less than 1 percent). The primary land use types impacted during construction would be forest/woodland (33 percent), open land (28 percent), industrial/commercial land (26 percent), and residential land (9 percent). Agricultural land and open water would make up the remaining 4 percent of land types impacted during construction of the proposed Project.

Following construction, about 42.4 acres of new land outside of Algonquin's existing permanent right-of-way would be permanently encumbered by operation of the Project. About 80 percent of this acreage would be for the new pipeline right-of-way, 16 percent for aboveground facilities, and 4 percent for new permanent access roads. The primary land use types that would be permanently encumbered by new easements would be forest/woodland (64 percent), open land (18 percent), industrial/commercial land (7 percent), and agricultural land (7 percent). Open water and residential land would make up the remaining 4 percent of new permanent impacts.

Algonquin's proposed construction work areas would be located within 50 feet of 332 residential structures (i.e., houses and apartment buildings) and 94 non-residential structures (i.e., commercial or industrial facilities, sheds, garages). To address impacts on residences, Algonquin developed Residential Construction Plans to inform affected landowners of proposed measures to minimize disruption and to maintain access to the residences during construction. We have reviewed the revised Residential Construction Plans submitted on September 29, 2014. We conclude that Algonquin's revised Residential Construction Plans are sufficient to minimize, to the extent possible, potential impacts on residences within 10 feet of the construction workspace and are acceptable overall. However, we are recommending that Algonquin provide a revised set of Residential Construction Plans that incorporate and address any comments Algonquin received from affected landowners, prior to construction.

In general, Project impacts on recreational and special interest areas would be temporary and limited to the period of active construction, which typically lasts several weeks or months in any one area. These impacts would be minimized by implementing the measures in Algonquin's E&SCP, traffic management plans, Fugitive Dust Control Plan, as well as measures to ensure that noise is mitigated. Algonquin developed site-specific measures to further minimize impacts on the Buchanan-Verplanck Elementary School in New York; Dodd Stadium in Norwich, Connecticut; the Norfolk Golf Club in Westwood, Massachusetts; Gonzalez Field in Dedham, Massachusetts; and St. Theresa of Avila School in West Roxbury, Massachusetts, all of which would sufficiently minimize impacts on these areas. Algonquin also developed site-specific measures to minimize impacts on St. Patrick's Church in Verplanck, New York; however, we are recommending that a revised site-specific plan be developed incorporating additional mitigation measures.

To address traffic impacts related to road crossings and in-street construction in densely populated areas, Algonquin has prepared separate Traffic Management Plans for the West Roxbury Lateral in Massachusetts and pipeline segments in New York. The plans include measures to address motor vehicles, parking, and considerations for pedestrians, bicycles, and construction workers. We have reviewed these plans and found them acceptable with the exception of a portion of the Traffic Management Plan for the New York pipeline segments. Therefore, we are recommending that Algonquin provide a revised plan that includes the site-specific details for several road crossings prior to construction. Impacts on traffic during construction along the West Roxbury Lateral would result in localized, unavoidable significant adverse impacts, particularly at the Spring Street/Centre Street intersection. However, with the implementation of Algonquin's Traffic Management Plan for the West Roxbury Lateral, impacts resulting from in-street construction would be minimized to the extent possible and would be reduced to less than significant levels at all other locations along the West Roxbury Lateral.

Construction of the Project would result in minor beneficial socioeconomic impacts due to increases in construction jobs, payroll taxes, purchases made by the workforce, and expenses associated with the acquisition of material goods and equipment. Operation of the Project would have a minor to moderate positive effect on the local governments' tax revenues due to the increase in property taxes that would be collected from Algonquin.

Algonquin conducted archival research and walkover surveys of the proposed Project area to identify historic aboveground properties and locations for additional subsurface testing in areas with potential for prehistoric and historic archaeological sites. Algonquin then conducted field surveys for aboveground properties and archaeological sites. Algonquin identified a total of 43 archaeological sites within the Project's area of potential effect. Of these, 28 require additional testing to determine eligibility for listing on the National Register of Historic Places (NRHP); 13 are not eligible; 1 is eligible for listing but would be avoided by the Project; and 1 is listed on the NRHP but would also be avoided by the Project. In addition, 388 historic aboveground resources were identified within the area of potential effect, the majority of which (359) are not eligible for listing on the NRHP and no further work is recommended. The Project would not result in any significant or adverse effects on the remaining 29 identified historic aboveground resources. To ensure that our responsibilities under section 106 of the National Historic Preservation Act are met, we are recommending that Algonquin not begin construction until any additional required surveys are completed, remaining survey reports and treatment plans (if necessary) have been reviewed by the appropriate parties, and we provide written notifications to proceed.

We consulted with nine tribes to provide an opportunity to identify any concerns about properties of traditional religious or cultural significance that may be affected by this undertaking. Eight of the tribes have contacted FERC staff to express an interest in the Project, request additional information, request to be kept apprised of the Project, and/or to accompany the archaeological field crews. Consultations with several other governmental organizations, non-governmental organizations, non-federally recognized tribes, and municipal historic preservation commissions in New York and Massachusetts were also conducted to provide them an opportunity to comment on the Project.

Air quality impacts associated with construction of the Project would include emissions from fossil-fueled construction equipment and fugitive dust. Such air quality impacts would generally be temporary and localized, and are not expected to cause or contribute to a violation of applicable air quality standards. Algonquin has prepared a Fugitive Dust Control Plan that describes the mitigation measures that would be implemented to control fugitive dust during Project construction, especially in sensitive areas such as road crossings, residences, and nonattainment areas. We have reviewed the Fugitive Dust Control Plan and find it acceptable.

Due to modifications on existing equipment and/or removal of existing compressors, the potential emissions of most pollutants at the Stony Point and Southeast Compressor Stations would be reduced from their current potential levels. Further, based on the identified estimated emissions from operation of the proposed Project facilities and review of the modeling analysis for all compressor stations, the Project would result in continued compliance with the National Ambient Air Quality Standards, which are protective of human health, including children, the elderly, and sensitive populations. Therefore, with the mitigation measures proposed by Algonquin, we do not anticipate that construction and operation of the proposed Project facilities would have a significant impact on air quality in the Project area or in the region itself.

Noise would be generated during construction of the pipeline and aboveground facilities. Noise impacts during construction would be highly localized and attenuate quickly as the distance from the noise source increases. The one exception to this would be certain HDD activities at the Hudson River and Interstate 84/Still River crossings. Algonquin would implement mitigation at all proposed HDD entrance locations to reduce the predicted noise generated by the HDD operations below the FERC noise requirement of 55 decibels on an A-weighted scale – day/night average at the closest noise sensitive areas. In response to traffic concerns raised by municipalities due to the proposed construction along portions of the West Roxbury Lateral, Algonquin has committed to nighttime construction along Providence Highway and the High Street/East Street intersection to minimize traffic impacts on this roadway. Nighttime construction in these residential areas would result in a temporary impact on noise levels to the nearby noise sensitive areas. However, we note that Project construction would be similar to other road construction activities, which would also likely occur at night to avoid similar traffic impacts.

The modified compressor stations would generate noise on a continuous basis (i.e., 24 hours per day) once operating. Some noise would also be generated by the operation of M&R stations and the proposed mainline regulators. We reviewed the compressor station noise analyses and agree that, if properly implemented, the noise control measures would ensure that noise attributable to the modified compressor stations would be less than the FERC noise requirement at nearby noise sensitive areas. However, where the noise currently attributable to the compressor station is greater than our noise requirement, the noise attributable to the station modifications would cause no perceptible change to station noise levels. To ensure that the actual noise levels produced at the aboveground facilities are not significant, we are recommending that Algonquin submit operational noise surveys and add noise mitigation, as necessary, until noise levels are below our acceptable thresholds.

The pipeline and aboveground facilities associated with the AIM Project would be designed, constructed, operated, and maintained to meet or exceed the Pipeline and Hazardous Materials Safety Administration's Minimum Federal Safety Standards in 49 CFR 192 and other applicable federal and state regulations. The regulations include specifications for material selection and qualifications; minimum design requirements; and protection of the pipeline from internal, external, and atmospheric corrosion. By designing and operating the Project in accordance with the applicable standards, the Project would not result in significant increased public safety risk.

We received several scoping comments concerning the safety of the Project and its proximity to the Indian Point Energy Center (IPEC), a nuclear facility on the east bank of the Hudson River in Westchester County, New York. Because of the distance of the proposed Project from the IPEC generating facilities and the avoidance and mitigation measures that it would implement, the proposed route would not pose any new safety hazards to the IPEC facility. On August 21, 2014, after consultations between Entergy Nuclear Operations, Inc. (Entergy) and Algonquin, Entergy filed with the Nuclear Regulatory Commission its Safety Evaluation for the AIM Project. In its Safety Evaluation, Entergy concluded that the AIM Project poses no increased risks to the IPEC facility. The Nuclear Regulatory Commission reviewed the site hazards analysis performed by Entergy and performed an

independent confirmatory analysis of the blast analysis as well. The Nuclear Regulatory Commission concluded that a breach and explosion of the proposed 42-inch-diameter natural gas pipeline would not adversely impact the safe operation of the IPEC facility.

We also received several comments expressing safety concerns about potential interactions between Algonquin's proposed pipeline facilities and the West Point Partners' transmission line. Algonquin has committed to conduct an alternating current/direct current (AC/DC) interference study and incorporate field surveys and comprehensive modeling to identify potential adverse effects on the pipeline from stray currents. Although pipelines are routinely sited adjacent to electric transmission lines, we are recommending additional information to ensure that safety concerns about potential AC/DC interactions are adequately addressed. This includes receiving Algonquin's AC/DC interference study associated with the West Point Transmission Project and documentation of all consultations with West Point Partners, as well as any additional mitigation measures addressing safety-related issues or conflicts identified in the study.

We received numerous comments during scoping and on the draft EIS for the Project about cumulative impacts associated with development of natural gas reserves (including hydraulic fracturing) in the Marcellus shale region. Activities associated with Marcellus shale development would occur outside of the Project area's region of influence. As a result, the local resources that may be affected by Marcellus shale development would not be affected by the Project, and local resources affected by the Project would not be affected by development in the Marcellus shale region. Impacts associated with the proposed Project in combination with other projects identified within the region of influence would be relatively minor overall. We have included recommendations in the EIS to further reduce the environmental impacts associated with the AIM Project, as summarized in section 5.2. Additionally, Algonquin selected a route that collocates with existing rights-of-way where feasible. Therefore, we conclude that the cumulative impacts associated with the AIM Project, when combined with other known or reasonably foreseeable projects, would be effectively limited.

We also received numerous comments about cumulative impacts of the proposed Atlantic Bridge Project. Preliminary details about the Atlantic Bridge Project have been provided by Algonquin but no application has been filed. If this project moves forward as currently planned, it would impact resources in many of the same areas as the AIM Project and the level of impacts would be similar to those of the AIM Project. The AIM Project would be constructed in 2015 and 2016, and the disturbed areas would be restored prior to any start of the Atlantic Bridge Project, which at its earliest would be constructed in 2017. Another planned Algonquin project is the Access Northeast Project. Spectra Energy's website indicates that the company hoped to secure expression of interest from potential customers by the end of 2014, but it does not provide any information about the size or location of the proposed facilities. Spectra Energy indicates that, if they receive adequate market support, they would begin seeking regulatory approvals in 2015 with a goal of constructing and placing the facilities in service by the end of 2018. The Access Northeast Project would not occur at the same time as the AIM Project, and project details are not known at this time.

## **ALTERNATIVES CONSIDERED**

The No Action Alternative was considered for the Project. While the No Action Alternative would eliminate or delay the short and long-term environmental impacts identified in this EIS, Algonquin would be unable to supply an additional 342,000 dekatherms per day of natural gas to its existing mainline system; increase deliveries to the Project shippers at existing delivery points in southern New England; or provide three new delivery points for the Project shippers. We also considered the use of alternative energy sources and the potential effects of energy conservation, but these measures similarly would not satisfy the objectives of the Project, provide an equivalent supply of energy, or meet the

demands of the Project shippers. We concluded that the No Action Alternative, alternative energy sources, and energy conservation were not viable alternatives to the proposed Project in the required timeframe.

Our analysis of system alternatives included an evaluation of the existing Tennessee Gas Pipeline and Iroquois Gas Transmission systems as well as the planned Connecticut Expansion and Northeast Energy Direct Projects. None of the existing, proposed, or planned natural gas pipelines reach the delivery points required by the Project shippers in southern New England. To provide service to these delivery points, the existing and planned systems would need to be modified by constructing hundreds of miles of new pipeline, much of which would duplicate the existing Algonquin system. This would result in greater environmental impacts than the Project. Consequently, none of the system alternatives provide an environmental advantage over the proposed Project.

We evaluated Algonquin's proposed design for the Project to determine if any alternative designs would be feasible and environmentally preferable to the Project. We determined that alternative designs would result in operational inefficiencies associated with flow characteristics of natural gas within the system, and would shift, but not avoid, environmental impacts from one location to another. For these reasons, we concluded that alternative designs would not be practical or provide an environmental advantage over the proposed Project.

We also considered the feasibility of electric-driven compressor units in lieu of gas-fired units at each of the existing compressor station sites. We concluded that use of electric-driven compressor units would result in additional environmental impacts due to the installation of non-jurisdictional facilities such as electric transmission lines and substations. Although electric-driven units would result in lower operating emissions, Algonquin would be required to comply with its existing air permits at each site. For these reasons, electric-driven compressors would not be preferable to or provide a significant environmental advantage over the proposed Project.

Prior to the issuance of the draft EIS, we evaluated route alternatives for the Hudson River crossing and for the West Roxbury Lateral, several minor route variations along different segments of the Project, and site alternatives for M&R stations at the new delivery points in Connecticut and Massachusetts. We determined that none of the route or site alternatives or variations would offer significant environmental advantages over the Project. Following issuance of the draft EIS, Algonquin evaluated several route variations it incorporated into its proposed route and we received comments requesting that we evaluate other alternatives and variations to the newly proposed route. This final EIS includes a more detailed analysis of these nine route alternatives/variations. Seven of them were determined to be advantageous to the original proposed route and were incorporated into the Project. Algonquin also evaluated 23 minor pipeline shifts, workspace adjustments, and/or design modifications. We conducted a more detailed review of these proposed changes and determined that 19 of them were advantageous and were incorporated into the Project design. We also evaluated alternative construction methods for several waterbody and wetland crossings; however, none were found to be feasible or preferable to the proposed construction methods.

## **MAJOR CONCLUSIONS**

We determined that construction and operation of the Project would result in some adverse environmental impacts but most impacts would be reduced to less-than-significant levels. This determination is based on a review of the information provided by Algonquin and further developed from environmental information requests; site visits; scoping; literature research; alternatives analyses; and contacts with federal, state, and local agencies, and other stakeholders.

Although many factors were considered in this determination, the principal reasons are:

- About 35.0 miles (93 percent) of the 37.4 miles of AIM Project pipeline facilities would be within or adjacent to existing rights-of-way, consisting of Algonquin pipeline rights-of-way, public roadways, railways, and electric transmission line corridors.
- The majority of the pipeline facilities (70 percent) would replace existing Algonquin pipelines within existing rights-of-way.
- Algonquin would minimize impacts on natural and cultural resources during construction and operation of the Project by implementing its E&SCP; Spill Prevention, Control and Countermeasure Plan; Unexpected Contamination Encounter Procedures; Invasive Plant Species Control Plan; BDP Plan; Compensatory Mitigation Plan; Residential Construction Plans; Traffic Management Plans for New York and the West Roxbury Lateral; Procedures Guiding the Discovery of Unanticipated Cultural Resources and Human Remains; and Fugitive Dust Control Plan.
- Algonquin would utilize the HDD method to cross the Hudson and Still Rivers, which would avoid any direct impacts on these resources.
- We would complete the process with section 106 of the National Historic Preservation Act and implementing the regulations at 36 CFR 800 prior to allowing any construction to begin.
- We would ensure compliance with all mitigation measures that become conditions of the FERC authorizations and other approvals during our oversight of an environmental inspection and mitigation monitoring program.

In addition, we developed site-specific mitigation measures that Algonquin would implement to further reduce the environmental impacts that would otherwise result from construction and operation of its Project. We determined that these measures are necessary to reduce adverse impacts associated with the Project, and in part, are basing our conclusions on implementation of these measures. Therefore, we are recommending that these mitigation measures be attached as conditions to any authorization issued by the Commission. These recommended mitigation measures are presented in section 5.2 of the EIS.

## 1.0 INTRODUCTION

---

On February 28, 2014, Algonquin Gas Transmission, LLC (Algonquin), an indirect wholly owned subsidiary of Spectra Energy Corporation (Spectra), filed an application with the Federal Energy Regulatory Commission (Commission or FERC) under sections 7(b) and 7(c) of the Natural Gas Act (NGA) and Part 157 of the Commission's regulations. The application was assigned Docket No. CP14-96-000 and a *Notice of Application* was issued on March 18, 2014<sup>1</sup> and noticed in the Federal Register on March 24, 2014. Algonquin is seeking a Certificate of Public Convenience and Necessity (Certificate) from the FERC to construct, abandon, install, own, operate, and maintain expansions of its existing interstate natural gas pipeline systems in New York, Connecticut, Rhode Island, and Massachusetts.

We<sup>2</sup> prepared this environmental impact statement (EIS) to assess the environmental impacts associated with construction and operation of the facilities proposed by Algonquin in accordance with the requirements of the National Environmental Policy Act (NEPA) of 1969, as amended. The U.S. Environmental Protection Agency (EPA), U.S. Army Corps of Engineers (USACE), and U.S. Department of Transportation's Pipeline and Hazardous Materials Safety Administration (PHMSA) are cooperating agencies assisting in the preparation of the EIS because they have jurisdiction by law or special expertise with respect to environmental impacts associated with Algonquin's proposal. The roles of the FERC and the cooperating agencies in the project review process are described in section 1.2.

The vertical line in the margin identifies text that is new or modified in the final EIS and differs materially from corresponding text in the draft EIS. Changes were made to address comments from cooperating agencies and other stakeholders on the draft EIS; incorporate modifications to the Project proposed by Algonquin after publication of the draft EIS; and incorporate information filed by Algonquin in response to our recommendations in the draft EIS. As a result of the changes, 15 of the recommendations identified in the draft EIS are no longer applicable to the Project and do not appear in the final EIS. Additionally, three recommendations identified in the draft EIS have been substantively modified in the final EIS, and five new recommendations have been added in the final EIS.

Algonquin's proposal, referred to as the Algonquin Incremental Market Project (AIM Project or Project), involves the construction and operation of about 37.4 miles of natural gas pipeline and associated equipment and facilities in New York, Connecticut, and Massachusetts. The majority of the pipeline facilities (about 26.3 miles or 70 percent of the total 37.6 miles) would replace existing Algonquin pipelines, while the remainder of the pipeline facilities (about 11.1 miles or 30 percent) consists of new mainline pipeline, new loop pipeline, and one new lateral pipeline.

In addition to the pipeline facilities, Algonquin would modify 6 existing compressor stations and 24 existing metering and regulating (M&R) stations; construct 3 new M&R stations; and remove one existing M&R Station. Modifications to the six existing compressor stations include the installation of 81,620 total horsepower (hp) in Rockland and Putnam Counties, New York; New Haven, Middlesex, and Windham Counties, Connecticut; and Providence County, Rhode Island. Algonquin also proposes to abandon four existing compressor units for a total of 10,800 hp at one compressor station in Rockland County, New York. The 24 existing M&R station modifications include 3 in New York, 13 in Connecticut, and 8 in Massachusetts to accept the new gas flows associated with the proposed Project. The three new M&R stations to be constructed would be in Suffolk and Bristol Counties, Massachusetts.

---

<sup>1</sup> An errata notice was issued on March 19, 2014 to clarify that the Commission staff is preparing an environmental impact statement for the Algonquin Incremental Market Project.

<sup>2</sup> The pronouns "we," "us," and "our" refer to the environmental staff of the FERC's Office of Energy Projects.

and New London County, Connecticut. One M&R station would be decommissioned and removed in New London County, Connecticut. As part of the AIM Project, Algonquin would also modify facilities at three existing mainline valve (MLV) sites and five existing pig<sup>3</sup> launcher/receiver sites, and construct five new launcher/receiver sites, construct new MLV cross over piping at two locations, and construct a new MLV. Mainline regulation facilities would also be added at the terminus of one of the pipeline segments in New York.

## 1.1 PROJECT PURPOSE AND NEED

According to Algonquin, the purpose of the AIM Project is to expand its existing pipeline system from an interconnection at Ramapo, New York to deliver up to 342,000 dekatherms per day (Dth/d) of natural gas transportation service to the Connecticut, Rhode Island, and Massachusetts markets. Algonquin's stated objectives for the Project are:

- to provide the pipeline capacity necessary to transport additional natural gas supplies to meet the immediate and future load growth demands of local gas utilities in southern New England;
- eliminate capacity constraints on existing pipeline systems in New York State and southern New England;
- provide access to growing natural gas supply areas in the Northeast region to increase competition and reduce volatility in natural gas pricing in southern New England;
- improve existing compressor station emissions through the replacement of existing compressor units with new, efficient units; and
- provide the additional service by November 2016.

Under section 7(c) of the NGA, the Commission determines whether interstate natural gas transportation facilities are in the public convenience and necessity and, if so, grants a Certificate to construct and operate them. The FERC's Certificate Policy Statement<sup>4</sup> provides guidance as to how the Commission evaluates proposals for new construction, and establishes criteria for determining whether there is a need for a proposed project and whether it would serve the public interest. Decisions are based on technical competence, financing, rates, market demand, gas supply, environmental impact, long-term feasibility, and other issues concerning a proposed project. The Commission's goal is to give appropriate consideration to the enhancement of competitive transportation alternatives, the possibility of overbuilding, subsidization by existing customers, the applicant's responsibility for unsubscribed capacity, the avoidance of unnecessary disruptions of the environment, and the unneeded exercise of eminent domain in evaluating new pipeline construction. The Commission does not direct the development of the gas industry's infrastructure regionally or on a project-by-project basis, or redefine an applicant's stated purpose.

<sup>3</sup> A pipeline "pig" is a device to clean or inspect the pipeline. A pig launcher/receiver is an aboveground facility where pigs are inserted or retrieved from the pipeline.

<sup>4</sup> The Policy Statement can be found on our website at <http://www.ferc.gov/legal/maj-ord-reg/PL99-3-000.pdf>. Clarifying statements can be found by replacing "000" in the URL with "001" and "002."

Algonquin has executed precedent agreements<sup>5</sup> with 10 shippers, including 8 local distribution companies (LDCs) and two municipal utilities (collectively with the LDCs referred to as the Project Shippers) for firm transportation service to deliver new natural gas supplies to the Northeast region. The precedent agreements with the Project Shippers account for the entire Project capacity of 342,000 Dth/d. The 10 Project Shippers include:

- Yankee Gas Services Company (Yankee Gas);
- NSTAR Gas Company (NSTAR);
- Connecticut Natural Gas Corporation (Connecticut Natural Gas);
- The Southern Connecticut Gas Company (Southern Connecticut);
- The Narragansett Electric Company d/b/a National Grid (Narragansett Electric);
- Colonial Gas Company d/b/a National Grid (Colonial Gas);
- Boston Gas Company d/b/a National Grid (Boston Gas);
- Bay State Gas Company d/b/a Columbia Gas of Massachusetts, Inc. (Bay State);
- Norwich Public Utilities (NPU); and
- Middleborough Gas and Electric.

Noting the growing need for additional natural gas capacity in New England to help ensure electric generation system reliability, the Connecticut Department of Energy and Environmental Protection (CTDEEP) and New England States Committee on Electricity commented that the FERC should modify the scope of its NEPA analysis to include the Project both at its current size and for an alternative project of larger size such as the 433,000 Dth/d originally conceived by Algonquin. Algonquin reduced the scope of the AIM Project as a result of an open season. To follow the Certificate Policy Statement, Algonquin appropriately sized its proposal to ensure that there would be no subsidization from its existing shippers. The Commission analyzes a project as it is filed in an application and does not speculate on potential infrastructure. Additionally, the Commission cannot determine the environmental impacts of the larger version of the AIM Project without significantly more facility and siting information from Algonquin. Furthermore, the Commission has no authority to direct a pipeline company to construct facilities the company has deemed unnecessary for a project's objectives, which would be inefficient and costly.

Several comments were received during the scoping process and draft EIS comment period expressing concern that the Project would be used to export natural gas. Algonquin is not constructing the AIM Project for the purpose of supporting the export of natural gas from the United States. As discussed above, Algonquin is proposing to transport natural gas to meet the demand for natural gas in the Northeast U.S. markets. Specifically, Algonquin is proposing to construct the AIM Project based on commitments from the Project Shippers, which include LDCs and two municipal utilities, which have statutory, regulatory, and/or contractual obligations to serve natural gas customers within their respective service areas in New England. Even if precedent agreements were not in place for the entire proposed capacity, to be exported, the natural gas would need to be liquefied for transportation in specialized container ships to overseas markets. The process of liquefying the gas involves specialized equipment at a specific export facility. Currently, no existing operational export facilities or infrastructure exists on the east coast.<sup>6</sup> In addition, the timing and need as expressed through the precedent agreements greatly

---

<sup>5</sup> A precedent agreement is a binding contract under which one or both parties has the ability to terminate the agreement if certain conditions such as receipt of regulatory approvals, are not met.

<sup>6</sup> On September 29, 2014, FERC issued an order granting authorization to Dominion to convert its existing Cove Point LNG import facility in Maryland to an export facility. However, it is not currently operational. The anticipated in-service date for the liquefied natural gas export terminal is June 2017. We also note that the AIM Project would flow gas in a northeast direction, away from the Cove Point LNG facility.

proceeds the development of any potential nearby export facility as the facilities take several years to develop, advance through the regulatory process, and be constructed.

Comments were also received asking whether any of the natural gas would be, or has the potential to be, liquefied and stored at existing or proposed liquefied natural gas (LNG) facilities. As indicated above, the AIM Project is designed to transport natural gas to serve the Project Shipper's load in the Northeast markets. No new LNG storage facilities are proposed, and the Project is not designed for the purpose of the export of natural gas. However, it is unknown whether the natural gas transported on the AIM Project facilities would be liquefied and stored in existing LNG storage facilities after the natural gas is delivered by Algonquin to the Project Shippers. It is possible that the Project Shippers could use existing peak shaving<sup>7</sup> LNG facilities, but those facilities are not export terminal facilities.

We also received several comments regarding facility design and siting for the proposed replacement, loop, and lateral pipelines and other facilities for the Project and why they need to be located as proposed. Algonquin states that the design and configuration of the proposed facilities is based on flow dynamics and the pressure of natural gas as it moves through the pipeline system relative to the delivery points requested by the Project Shippers. An analysis of the Project's facility design and siting alternatives is provided in section 3.4.

## **1.2 PURPOSE AND SCOPE OF THE EIS**

Our principal purposes for preparing the EIS are to:

- identify and assess the potential impacts on the natural and human environment that would result from the implementation of the proposed Project;
- describe and evaluate reasonable alternatives to the proposed Project that would avoid or minimize adverse effects on the environment;
- identify and recommend specific mitigation measures, as necessary, to minimize environmental impacts; and
- encourage and facilitate involvement by the public and interested agencies in the environmental review process.

The topics addressed in the EIS include alternatives; geology; soils; groundwater; surface waters; wetlands; vegetation; wildlife and aquatic resources; special status species; land use, recreation, special interest areas, and visual resources; socioeconomics (including transportation and traffic); cultural resources; air quality and noise; reliability and safety; and cumulative impacts. The EIS describes the affected environment as it currently exists, addresses the environmental consequences of the AIM Project, and compares the Project's potential impacts to those of the alternatives. The EIS also presents our conclusions and recommended mitigation measures for the Project.

We received comments that Marcellus shale production activity should be included in the scope of the proposed Project. The Project does not include the production of natural gas. The scope of this EIS focuses on the natural gas transmission facilities that Algonquin would construct and operate. Our authority under the NGA and NEPA review requirements relates only to natural gas facilities that are involved in interstate commerce. Thus, the facilities associated with the production of natural gas are not under FERC jurisdiction.

---

<sup>7</sup> Peak shaving facilities store surplus natural gas to meet demand during high-use ("peak") consumption timeframes (e.g., winter cold snaps and summer heat waves).

Commentors also noted that the EIS should address the indirect impacts of induced Marcellus shale development. Impacts that may result from additional shale gas development are not “reasonably foreseeable” as defined by the Council on Environmental Quality (CEQ) regulations. Nor is such additional development, or any correlative potential impacts, an “effect” of the Project, as contemplated by the CEQ regulations, for purposes of a cumulative impact analysis. The development of the Marcellus shale, which is regulated by the states, continues to drive the need for takeaway interstate pipeline capacity to allow the gas to reach markets. Therefore, companies are planning and building interstate transmission facilities in response to this new source of gas supply. In addition, many production facilities have already been permitted and/or constructed in the region, creating a network through which natural gas may flow along various pathways to local users or the interstate pipeline system, including Algonquin’s existing system. Algonquin would receive natural gas through its interconnection with other natural gas pipelines. These interconnecting pipeline systems span multiple states with shale formations in the northeast, as well as conventional gas formations. We cannot estimate how much of the Project volumes would come from current/existing shale gas production and how much, if any, would be new production “attributable” to the Project.

We also note that the EPA and the states have imposed regulations within the past 2 to 3 years on natural gas production to minimize leaks and methane emissions. Therefore, past studies on production leaks and methane emissions cannot be used to appropriately predict future methane emissions. Predicting methane emissions and associated climate impacts is speculative given the newly required minimization efforts.

The Project does not depend on additional shale gas production that may occur for reasons unrelated to the Project and over which the Commission has no control, such as state permitting for additional gas wells. An overall increase in production of shale gas may occur for a variety of reasons, but the location and subsequent production activity is unknown and too speculative to assume based on the interconnected interstate natural gas pipeline system. Accordingly, the factors necessary for a meaningful analysis of when, where, and how shale gas development would occur are unknown at this time. It is simply impractical for this EIS to consider impacts associated with additional shale gas development in separate geographic areas than the proposed Project because cumulative impacts resulting from the Project must, under CEQ regulations, be meaningfully analyzed by this Commission.

We also received comments about cumulative impacts associated with development of natural gas reserves (including hydraulic fracturing) in the Marcellus shale region. Marcellus shale production and development of gas reserves are discussed in section 4.13.

Comments were also received regarding the AIM Project’s potential relationship to the Atlantic Bridge and Access Northeast Projects and possible improper project segmentation. Improper segmentation is usually concerned with projects that have reached the proposal stage, which is not the case here. Algonquin has not filed an application with the Commission for the Atlantic Bridge or Access Northeast Projects. Rather, Algonquin is still evaluating the potential Atlantic Bridge and Access Northeast Projects based on interest for additional natural gas supplies in New England and/or the Canadian Maritime provinces. The Atlantic Bridge and Access Northeast Projects are still in the development phase and precedent agreements are under consideration.

Even so, the AIM Project is an unconnected single action that has independent utility irrespective of any other projects, including the Atlantic Bridge and Access Northeast Projects. As discussed in section 1.1, Algonquin has executed precedent agreements with 10 shippers who account for the entire AIM Project capacity of 342,000 Dth/d. These are firm commitments needed to meet a discrete market in southern New England beginning in November 2016. Therefore, the scope of this EIS is limited to the AIM Project. However, section 4.13 of this EIS does address cumulative impacts of the Atlantic Bridge and Access Northeast Projects.

### **1.2.1 Federal Energy Regulatory Commission Purpose and Role**

The FERC is an independent federal agency responsible for evaluating applications for authorization to construct and operate interstate natural gas pipeline facilities. If the Commission determines that a project is required by the public convenience and necessity, Certificates are issued under sections 7(b) and 7(c) of the NGA and Part 157 of the Commission's regulations. As such, the FERC is the lead federal agency for the preparation of the EIS in compliance with the requirements of NEPA, the CEQ regulations for implementing the procedural provisions of NEPA (Title 40 Code of Federal Regulations [CFR] Parts 1500-1508 [40 CFR 1500-1508]), and the FERC's regulations implementing NEPA (18 CFR 380).

This EIS presents our review of potential environmental impacts and reasonable recommendations to avoid or mitigate impacts. This EIS will be used as an element in the Commission's review of the Project to determine whether a Certificate would be issued. The FERC will also consider non-environmental issues in its review of Algonquin's application. A Certificate will be granted if the Commission finds that the evidence produced on financing, rates, market demand, gas supply, existing facilities and service, environmental impacts, long-term feasibility, and other issues demonstrates that the Project is required by the public convenience and necessity. Environmental impact assessment and mitigation development are important factors in the overall public interest determination.

### **1.2.2 U.S. Environmental Protection Agency Purpose and Role**

The EPA is an independent federal agency responsible for protecting human health and safeguarding the natural environment. The EPA has delegated water quality certification, under section 401 of the Clean Water Act (CWA), to the jurisdiction of individual state agencies. The EPA may assume section 401 authority if no state program exists, if the state program is not functioning adequately, or at the request of the state. The EPA also oversees the issuance of a National Pollutant Discharge Elimination System (NPDES) permit by the state agency, under section 402 of the CWA, for point-source discharge of water used for hydrostatic testing of pipelines into waterbodies. The EPA also has the authority to review and veto permits issued by the USACE under section 404 of the CWA. In addition to its authority under the CWA, the EPA also has jurisdictional authority under the Clean Air Act (CAA) to control air pollution by developing and enforcing rules and regulations for all entities that emit toxic substances into the air. Under this authority, the EPA has developed regulations for major sources of air pollution, and has delegated the authority to implement these regulations to state and local agencies. State and local agencies are allowed to develop and implement their own regulations for non-major sources of air pollutants. The EPA also establishes general conformity applicability thresholds that a federal agency can utilize to determine whether a specific action requires a general conformity assessment.

In addition to its permitting responsibilities, the EPA is required under section 309 of the CAA to review and publicly comment on the environmental impacts of major federal actions including actions that are the subject of draft and final EISs, and is responsible for implementing certain procedural provisions of NEPA (e.g., publishing Notices of Availability of the draft and final EISs in the Federal Register) to establish statutory timeframes for the environmental review process.

### **1.2.3 U.S. Army Corps of Engineers Purpose and Role**

The USACE is a federal agency within the U.S. Department of Defense with jurisdictional authority pursuant to section 404 of the CWA (Title 33 of the United States Code [USC], Section 1344 [33 USC 1344]), which governs the discharge of dredged or fill material into waters of the United States, and section 10 of the Rivers and Harbors Act (RHA) (33 USC 403), which regulates any work or structures that potentially affect the navigable capacity of a waterbody. Because the USACE would need to evaluate and approve several aspects of the Project and must comply with the requirements of NEPA before issuing permits under the above statutes, it has elected to participate as a cooperating agency in the

preparation of this EIS. The USACE would adopt the EIS per 40 CFR 1506.3 if, after an independent review of the document, it concludes that the EIS satisfies the USACE's comments and recommendations. The Project occurs within the New York and New England Districts of the USACE.

The primary decisions to be addressed by the USACE include:

- issuance of a section 404 permit for aquatic resource impacts associated with construction of the Project; and
- issuance of section 10 permit for construction activities within navigable waters of the United States.

This EIS contains information needed by the USACE to reach decisions on these issues. Through the coordination of this document, the USACE would obtain the views of the public and natural resource agencies prior to reaching decisions on the Project.

Algonquin submitted applications for section 404/10 permits to the New York and New England Districts on March 21 and March 25, 2014, respectively. The USACE published public notices for Algonquin's applications in the Federal Register on August 14, 2014 (New York) and August 19, 2014 (New England), concurrent with the draft EIS and the FERC public comment period. As an element of its review, the USACE must consider whether a proposed project avoids, minimizes, and compensates for impacts on existing aquatic resources, including wetlands, to strive to achieve a goal of no overall net loss of values and functions. Based on its participation as a cooperating agency and its consideration of the final EIS (including responses to public comments), the USACE would issue a Record of Decision to formally document its decision on the proposed action, including section 404 (b)(1) analysis and required environmental mitigation commitments.

#### **1.2.4 U.S. Department of Transportation – Pipeline and Hazardous Materials Safety Administration**

PHMSA is the federal agency responsible for administering the national regulatory program to ensure the safe transportation of natural gas, petroleum, and other hazardous materials by pipeline under 49 USC Chapter 601. PHMSA's Office of Pipeline Safety (OPS) develops regulations and other approaches to risk management to ensure safety in design, construction, testing, operation, maintenance, and emergency response of pipeline facilities. The OPS is responsible for ensuring that Algonquin's proposed facilities are designed, constructed, and operated in compliance with the safety standards that the agency has established for natural gas pipeline facilities.

### **1.3 PERMITS, APPROVALS, AND REGULATORY REQUIREMENTS**

As the lead federal agency for the AIM Project, the FERC is required to comply with section 7 of the Endangered Species Act of 1973 (ESA), the Migratory Bird Treaty Act (MBTA), the Magnuson-Stevens Fishery Conservation and Management Act of 1976 (MSA), the RHA, the CWA, the CAA, section 106 of the National Historic Preservation Act (NHPA), and section 307 of the Coastal Zone Management Act of 1972 (CZMA). These and other statutes have been taken into account in the preparation of the EIS.

Table 1.3-1 lists the major federal, state, and local permits, approvals, and consultations for construction and operation of the Project. The table also provides each status. The FERC encourages cooperation between applicants and state and local authorities, but this does not mean that state and local agencies, through applications of state and local laws, may prohibit or unreasonably delay the construction or operation of facilities approved by the FERC. Any state or local permits issued with respect to jurisdictional facilities must be consistent with the conditions of any authorization issued by the FERC.

TABLE 1.3-1			
Major Permits, Approvals, and Consultations for the AIM Project <sup>a</sup>			
Agency	Permit/Approval/ Consultation	Agency Action	Status
<b>Federal</b>			
FERC	Certificate	Consider issuance of a Certificate under sections 7(b) and (c) of the NGA.	Application filed February 28, 2014
USACE	Section 404, CWA Permit	Issuance of a section 404 permit for discharges of dredged or fill material into waters of the United States, including jurisdictional wetlands.	Applications filed March 21, 2014 (New York District; March 25, 2014 (New England District)
<ul style="list-style-type: none"> <li>New England District</li> <li>New York District</li> </ul>			
	Section 10 RHA Permit	Issuance of a section 10 permit for structures or work in or affecting navigable waters of the United States.	Application filed March 21, 2014 (only applicable to New York District)
EPA	Section 404, CWA	Review CWA, section 404 wetland dredge-and-fill applications to the USACE with 404(c) veto power for wetland permits issued by the USACE.	Consultation through the USACE process
<ul style="list-style-type: none"> <li>Region 1 (New England)</li> <li>Region 2 (New York)</li> </ul>	CAA	Determination of General Conformity applicability. Review and publicly comment on the environmental impacts of major federal actions.	Ongoing
National Oceanic and Atmospheric Administration's National Marine Fisheries Service	Section 7 ESA Consultation	Finding of impacts on federally listed or proposed threatened and endangered (T&E) marine species and their habitat.	Complete
	MSA Consultation	Assess impacts and provide comments to prevent loss of and damage to essential fish habitat.	Complete
U.S. Fish and Wildlife Service	Section 7 ESA Consultation, Biological Opinion	Finding of impacts on federally listed or proposed species. Provide Biological Opinion if the Project is likely to adversely affect federally listed or proposed species or their habitats.	Complete
<ul style="list-style-type: none"> <li>New England Field Office</li> <li>New York Field Office</li> </ul>	Fish and Wildlife Coordination Act	Provide comments to prevent loss of and damage to wildlife resources.	Complete

Massachusetts Board of Underwater Archaeological Resources	Section 106, NHPA	Review and comment on the Project and its effects on historic properties.	Ongoing
Massachusetts Department of Conservation and Recreation	Section 106, NHPA	Review and comment on the Project and its effects on historic properties.	Ongoing

TABLE 1.3-1 (cont'd)			
Major Permits, Approvals, and Consultations for the AIM Project <sup>a</sup>			
Agency	Permit/Approval/ Consultation	Agency Action	Status
<b>Local</b>			
Local Municipal Conservation Commissions	Massachusetts Wetlands Protection Act	Review and issue Order of Conditions for wetlands.	Applications to be filed 1 <sup>st</sup> quarter 2015
Municipal Historical Commissions	Section 106, NHPA	Review and comment on the Project and its effects on historic properties.	Ongoing
<sup>a</sup> Consultations with Native American tribes are discussed in section 4.10.2. <sup>b</sup> The Project is not subject to New York's State Environmental Quality Review Act because it is subject to the federal NGA and, therefore, is reviewed under the NEPA.			

### 1.3.1 Endangered Species Act

Section 7 of the ESA, as amended, states that any project authorized, funded, or conducted by any federal agency (e.g., FERC) should not "...jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of habitat of such species which is determined...to be critical..." (16 USC Section 1536(a)(2)(1988)). The FERC, or Algonquin as a non-federal party, is required to consult with the U.S. Fish and Wildlife Service (FWS) and the National Oceanic and Atmospheric Administration's (NOAA) National Marine Fisheries Service (NOAA Fisheries) to determine whether any federally listed or proposed endangered or threatened species or their designated critical habitat occur in the vicinity of the Project. If the FERC determines that these species or habitats may be impacted by the Project, the FERC is required to prepare a biological assessment (BA) to identify the nature and extent of adverse impact, and to recommend measures to avoid or reduce potential impacts on habitat and/or species. If, however, the FERC determines that no federally listed or proposed endangered or threatened species or their designated critical habitat would be impacted by the Project, no further action is necessary under the ESA. See section 4.7.1 of this EIS for the status of our compliance with section 7 of the ESA.

### 1.3.2 Migratory Bird Treaty Act

Migratory birds are species that nest in the United States and Canada during the summer and then migrate south to the tropical regions of Mexico, Central and South America, and the Caribbean for the non-breeding season. Migratory birds are protected under the MBTA (16 USC 703–711; MBTA). Executive Order (EO) 13186 (66 Federal Register 3853) directs federal agencies to identify where unintentional take is likely to have a measurable negative effect on migratory bird populations and to avoid or minimize adverse impacts on migratory birds through enhanced collaboration with the FWS. EO 13186 states that emphasis should be placed on species of concern, priority habitats, and key risk factors, and that particular focus should be given to addressing population-level impacts.

On March 30, 2011, the FWS and the Commission entered into a *Memorandum of Understanding Between the Federal Energy Regulatory Commission and the U.S. Department of the Interior United States Fish and Wildlife Service Regarding Implementation of Executive Order 13186, "Responsibilities of Federal Agencies to Protect Migratory Birds"* (MBTA MOU) that focuses on avoiding or minimizing adverse impacts on migratory birds and strengthening migratory bird conservation through enhanced collaboration between the two agencies. See section 4.7.2 of this EIS for the status of our compliance with the MBTA.

### **1.3.3 Magnuson-Stevens Fishery Conservation Management Act**

The MSA, as amended by the Sustainable Fisheries Act of 1996 (Public Law 104-267), established procedures designed to identify, conserve, and enhance essential fish habitat (EFH) for those species regulated under a federal fisheries management plan. The MSA requires federal agencies to consult with NOAA Fisheries on all actions or proposed actions authorized, funded, or undertaken by the agency that may adversely impact EFH (MSA section 305(b)(2)). Although absolute criteria have not been established for conducting EFH consultations, NOAA Fisheries recommends consolidating EFH consultations with interagency coordination procedures required by other statutes such as NEPA, the Fish and Wildlife Coordination Act, or the ESA (50 CFR 600.920(e)) in order to reduce duplication and improve efficiency. As part of the consultation process, we have prepared an EFH Assessment included in section 4.6.2.4.

### **1.3.4 Rivers and Harbors Act**

The RHA pertains to activities in navigable waters as well as harbor and river improvements. Section 10 of the RHA prohibits the unauthorized obstruction or alteration of any navigable water of the United States. Construction of any structure or the accomplishment of any other work affecting course, location, condition, or physical capacity of waters of the United States must be authorized by the USACE. The only section 10 river crossed by the Project is the Hudson River. The Hudson River crossing is discussed in detail in section 4.3.2.

### **1.3.5 Clean Water Act**

The CWA, as amended, regulates the discharges of pollutants into waters of the United States and regulates quality standards for surface waters. To enact this goal both the EPA and the USACE have regulatory authority under this statute. The EPA has implemented pollution control programs including setting wastewater standards for industry and creating water quality standards for all contaminants in surface waters. Under the CWA, it is unlawful to discharge any pollutant from a point source into waters of the United States without a permit. The EPA operates the NPDES permit program that regulates discharges by industrial, municipal, and other facilities, if discharges directly enter surface waters. Section 404 of the CWA regulates the discharge of dredged or fill material into waters of the United States and is under jurisdiction of the USACE. The status of NPDES and section 404 permitting requirements are further addressed in sections 4.3.2 and 4.4.3 of this EIS.

Section 401 of the CWA requires that an applicant for a federal permit who conducts any activity that may result in a discharge to waters of the United States must provide the federal regulatory agency with a section 401 certification. Section 401 certifications are made by the state in which the discharge originates and declares that the discharge would comply with applicable provisions of the act, including the state water quality standards. The New York State Department of Environmental Conservation (NYSDEC), CTDEEP, and Massachusetts Department of Environmental Protection (MADEP) are the applicable regulatory authorities delegated with section 401 certification for the states of New York, Connecticut, and Massachusetts. A section 401 certification is not required for the modifications proposed in Rhode Island.

### **1.3.6 Clean Air Act**

The CAA, as amended, defines the EPA's responsibilities for protecting and improving the nation's air quality and the stratospheric ozone layer. Under the CAA, the EPA sets limits on certain air pollutants and grants them the authority to limit emissions of air pollutants coming from sources such as industrial facilities. The EPA has delegated the authority to implement these regulations to state and local agencies. In New York, the NYSDEC is responsible for enforcement of air quality standards at a state level as well as enforcement of the State Implementation Plan (SIP) required under the CAA. In

Connecticut, the CTDEEP is responsible for enforcement of air quality standards at a state level as well as enforcement of the SIP required under the CAA. In Rhode Island, the Rhode Island Department of Environmental Management (RIDEM) is responsible for enforcement of air quality standards at a state level as well as enforcement of the SIP required under the CAA. In Massachusetts, the MADEP is responsible for enforcement of air quality standards at a state level as well as enforcement of the SIP required under the CAA. The EPA issued a rule in 2010 finalizing greenhouse gas (GHG) reporting requirements for the petroleum and natural gas industry (40 CFR 98). New York, Connecticut, Rhode Island, and Massachusetts have each modified their respective SIPs to regulate GHGs and issue permits for GHGs for large and modified sources under the Prevention of Significant Deterioration (PSD) program. See section 4.11.1 of this EIS for additional information regarding our compliance with the CAA and SIPs.

### **1.3.7 National Historic Preservation Act**

Section 106 of the NHPA, as amended, requires the FERC to take into account the impacts of its undertakings on historic properties, and afford the Advisory Council on Historic Preservation (ACHP) an opportunity to comment. Historic properties include prehistoric or historic sites, districts, buildings, structures, objects, or properties of traditional religious or cultural importance listed in or eligible for listing in the National Register of Historic Places (NRHP). In accordance with the ACHP's regulations for implementing section 106, at 36 CFR 800.2(a)(3), the FERC is using the services of Algonquin and its consultants to prepare information, analyses, and recommendations. However, we remain responsible for all findings and determinations. We will follow the process of complying with Section 106 outlined in Part 800 by consulting with each state's State Historic Preservation Office (SHPO), identifying historic properties in the area of potential effect (APE), and assessing potential project effects. Section 4.10.4 of this EIS summarizes the status of our compliance with the NHPA.

### **1.3.8 Coastal Zone Management Act**

The CZMA calls for the "effective management, beneficial use, protection, and development" of the nation's coastal zone and promotes active state involvement in achieving those goals. As a means to reach those goals, the CZMA requires participating states to develop management programs that demonstrate how these states would meet their obligations and responsibilities in managing their coastal areas. In New York, the New York State Department of State (NYSDOS), Office of Communities and Waterfronts is the agency responsible for administering its Coastal Zone Management Program (CZMP). In Massachusetts, the responsible agency is the Massachusetts Executive Office of Energy and Environmental Affairs (MAEOEEA), Office of Coastal Zone Management (MACZM). The coastal zone would not be affected by the Project in Connecticut or Rhode Island. Because section 307 of the CZMA requires federal agency activities to be consistent to the maximum extent practicable with the enforceable policies of a management program, the FERC has requested that Algonquin seek a determination of consistency with New York's and Massachusetts's CZMPs. On February 6, 2014, MACZM determined that due to the limited nature of the work in Massachusetts, the Project falls below the threshold requiring federal consistency. On September 2, 2014, Algonquin received its consistency certification from NYSDOS. Section 4.8.4 of this EIS summarizes our compliance with the CZMA.

## **1.4 PUBLIC REVIEW AND COMMENT**

On June 18, 2013, Algonquin filed a request with the FERC to implement the Commission's NEPA pre-filing process for the AIM Project. The purpose of the pre-filing process is to encourage early involvement of interested stakeholders, facilitate interagency cooperation, and identify and resolve issues before an application is filed with the Commission. On June 28, 2013, the FERC granted Algonquin's request and established a pre-filing Docket Number (PF13-16-000) to place information related to the Project into the public record.

Prior to entering the pre-filing process, Algonquin began conducting outreach activities with governmental stakeholders in the fall of 2012 and landowners in early 2013. In April and May 2013, Algonquin held six landowner informational meetings in New York, four in Connecticut, and two in Rhode Island to acquaint landowners and public officials with the Project and to gather input. After entering the pre-filing process, Algonquin held one additional landowner informational meeting in Connecticut and two in Massachusetts in July 2013.

In conjunction with the pre-filing process, Algonquin implemented a Public and Agency Participation Plan to identify stakeholders, share information regarding the Project, seek input on environmental and other issues, and provide opportunities for public comment. As part of its plan, Algonquin communicated with landowners; elected officials and staff; community leaders; federal, state, and local agencies; non-governmental organizations; local businesses; nearby residents; civic organizations; and other interested individuals and organizations. Algonquin used direct mail to provide information on the AIM Project to stakeholders and established a toll-free Project hotline and targeted Project page on the Spectra website. The website includes a Project description and overview map, information on the FERC's environmental review process, and contact information for the AIM Project.

In May 2013, Algonquin wrote to nine federally recognized Indian tribes (the Delaware Nation of Oklahoma, Delaware Tribe of Indians, Mashantucket (Western) Pequot Tribal Nation, Mashpee Wampanoag Indian Tribe, Mohegan Indian Tribe, Narragansett Indian Tribe, Saint Regis Mohawk Tribe, Stockbridge-Munsee Community Band of Mohican Indians, and Wampanoag Tribe of Gay Head (Aquinnah)) to provide an opportunity to identify any concerns about properties of traditional religious or cultural significance that may be affected by this undertaking. In November 2013, the FERC wrote letters to the federally recognized tribes to request their comments on the proposed Project. Additional information on outreach to tribes is provided in section 4.10.1.3.

Algonquin held 10 public open house meetings in August and September 2013, including 4 in New York, 3 in Connecticut, 2 in Rhode Island, and 1 in Massachusetts, to provide information on the AIM Project and solicit feedback from stakeholders on environmental issues and other concerns. We participated in these open house meetings, provided information on the Commission's environmental review process for the AIM Project, and took comments about the Project and the alternatives.

We participated in interagency meetings, conference calls, and site visits for the AIM Project to identify issues to be addressed in this draft EIS. The meetings, conference calls, and site visits provided a forum for the exchange of information and supported the FERC's responsibility to coordinate federal authorizations and associated environmental review of the AIM Project. Additionally, we hosted 20 regular conference calls with Algonquin and other agencies to discuss AIM Project status and issues. We also hosted regular (mostly weekly) conference calls with tribes, Algonquin, and Algonquin's cultural resources consultant to discuss schedule and coordination for pending cultural resources field investigations. Summaries of the meetings and calls are available for viewing on the FERC's eLibrary website ([www.ferc.gov](http://www.ferc.gov)).<sup>8</sup>

---

<sup>8</sup> Public meeting transcripts and comment letters are available for viewing on the FERC website (<http://www.ferc.gov>). Using the "eLibrary" link, select "General Search" from the eLibrary menu, enter the selected date range and "Docket No." excluding the last three digits (i.e., PF13-16 or CP14-96), and follow the instructions. For assistance, call 1-866-208-3676, or e-mail [FERCOnlineSupport@ferc.gov](mailto:FERCOnlineSupport@ferc.gov). Because scoping was conducted during the pre-filing review (i.e., before Algonquin filed a formal application with the FERC), PF13-16 must be entered in the Docket No. field to view the public scoping transcripts and comment letters. To view information available after Algonquin's application was filed, including the transcripts of the comment meetings on the draft EIS, CP14-96 must be entered in the Docket No. field.

On September 13, 2013, the FERC issued a *Notice of Intent to Prepare an Environmental Impact Statement for the Planned Algonquin Incremental Market Project, Request for Comments on Environmental Issues, and Notice of Public Scoping Meetings* (NOI). The NOI was published in the Federal Register on September 19, 2013, and copies were mailed to over 1,800 parties, including representatives of federal, state, and local agencies; elected officials; environmental and public interest groups; Native American tribes; potentially affected landowners; other interested parties; and local libraries and newspapers. The NOI described the FERC's environmental review process for the AIM Project; provided a preliminary list of issues for review in this draft EIS; requested written comments from the public on the scope of the draft EIS; announced the time and location of public scoping meetings; and invited other federal, state, and local agencies to participate as cooperating agencies in the preparation of the EIS. The NOI opened the public scoping period and established a closing date of October 15, 2013 for receiving scoping comments.

The FERC held four public scoping meetings in the AIM Project area to solicit and receive comments on environmental issues associated with this Project. The meetings were held September 30, 2013 through October 3, 2013 in the Town of Cortlandt, New York; Danbury, Connecticut; Norwich, Connecticut; and the Town of Dedham, Massachusetts. The scoping meetings provided an opportunity for the public to learn more about the proposed AIM Project and to provide comments on environmental issues to be addressed in this draft EIS. A combined total of 31 individuals provided verbal comments at the scoping meetings. Transcripts of the meetings, as well as 579 unique written comment letters, were entered into the public record and are available for viewing on the FERC's eLibrary website ([www.ferc.gov](http://www.ferc.gov)).

On August 6, 2014, we issued a *Notice of Availability of the Draft Environmental Impact Statement for the Proposed Algonquin Incremental Market Project*. This notice, which was published in the Federal Register, listed the dates and locations of public comment meetings and established a closing date of September 29, 2014 for receiving comments on the draft EIS. Copies of the draft EIS were mailed to over 2,740 stakeholders. The EPA noticed receipt of the draft EIS in the Federal Register on August 15, 2014.

We held five public comment meetings in the AIM Project area to solicit and receive comments on the draft EIS. The meetings were held between September 8 and September 16, 2014 in the Town of Dedham, Massachusetts; Norwich, Connecticut; Danbury, Connecticut; the Town of Cortlandt, New York; and the Town of Mapleville, Rhode Island. The meetings provided the public an opportunity to present oral comments on the analysis of environmental impacts described in the draft EIS. A combined total of approximately 692 individuals attended these comment meetings, including 143 who provided oral comments. We also received 352 individual comment letters from federal, state, and local agencies; companies/organizations; and individuals in response to the draft EIS prior to the close of the comment period on September 29, 2014. Eleven of the comment letters are form letters or petitions submitted or signed by multiple individuals. We also continued to accept comment letters for 2 weeks past the close of the comment period. Those letters received through October 10, 2014 included an additional 132 individual comment letters from federal, state, and local agencies; companies/organizations; and individuals and are included in our comment responses contained in Volume II.<sup>9</sup> Letters received after October 10, 2014 continued to be posted to the eLibrary site and were reviewed by staff for additional new substantive concerns, but are not included in Volume II because no new issues were raised that were not already addressed in previous comment letters. Transcripts from the public comment meetings, as

<sup>9</sup> Each comment letter received through October 10, 2014 has been scanned and sorted by commentor type (i.e., federal agencies, Native American tribes, state agencies, local agencies, companies and organizations, form letters, individuals, public meetings, and applicant). The comments within each letter or transcript have been coded and a response to each comment provided side-by-side with the scanned letter. The letters and responses are included in Volume II of the EIS.

well as the written comment letters, were entered into the public record and are available for viewing on the FERC's eLibrary website ([www.ferc.gov](http://www.ferc.gov)).

Concurrent with the production of the draft EIS and after its publication, Algonquin continued to conduct public outreach efforts in the Project area. As of October 23, 2014, Algonquin had hosted and/or attended 20 meetings with various agencies, landowner groups, stakeholders, and/or the public, including:

- 5 meetings in New York between September 5 and October 6, 2014 with the public and/or various representatives of the Town of Cortlandt, the Village of Buchanan, and the Hendrick Hudson school district;
- 2 meetings in Connecticut, including an October 6, 2014 meeting with the Town Manager and Mayor of the Town of Cromwell, and an October 23, 2014 meeting with Mohegan Tribal representatives; and
- 13 meetings in Massachusetts between July 8 and October 23, 2014 with the public and/or various representatives from the Massachusetts Water Resources Authority, Town of Dedham, Dedham Town Hall, Dedham Parks and Recreation Department, Town of Dedham Board of Selectman, Legacy Place Shopping Center and National Amusement, Town of Westwood, City of Boston, Boston City Council, West Roxbury Community, West Roxbury Saves Energy Steering Committee, and Massachusetts Department of Transportation (MassDOT).

This EIS addresses all substantive comments submitted to the FERC or made at the open houses, scoping meetings, interagency meetings, and comment meetings on the draft EIS. Table 1.4-1 lists the environmental issues and concerns identified by commentors during the scoping and comment process and identifies the section of the EIS where the issue is addressed.

Numerous commentors expressed support for the AIM Project, primarily due to the potential local employment opportunities that would be generated by the Project. However, many commentors expressed opposition to the Project. Health and safety concerns, the Project's purpose and need, impacts on air quality, and a preference for conservation and renewable energy sources were common objections. Other concerns included cumulative environmental impacts; concerns about the environmental review process; emergency response infrastructure capacity; and impacts on water resources, wetlands, vegetation, and wildlife.

Copies of this final EIS have been mailed to the agencies, individuals, organizations, and other parties identified in the distribution list provided as appendix A. Additionally, the final EIS has been filed with the EPA for issuance of a formal Notice of Availability in the Federal Register. In accordance with the CEQ's regulations implementing NEPA, no agency decision on the proposed actions may be made until 30 days after the EPA publishes the Notice of Availability in the Federal Register. However, the CEQ regulations provide an exception to this rule when an agency decision is subject to a formal internal appeal process that allows other agencies or the public to make their views known. This is the case at the FERC, where any Commission decision on the proposed action would be subject to a 30-day rehearing period. Therefore, the FERC decision may be made and recorded concurrently with the publication of the final EIS or any time thereafter.

TABLE 1.4-1 Issues Identified and Comments Received for the AIM Project	
Issue/Specific Comment	EIS Section Addressing Comment
<b>General</b>	
Potential for export of gas transported by the Project and the connection to any new or existing LNG facilities	1.1
Plans for abandonment of the pipeline segments that are being replaced	2.3.1.2
Discussion of regional/local need for capacity increase provided by the Project	1.1
Project segmentation	1.2
<b>Alternatives</b>	
Consideration of alternative routes to avoid populated areas, sensitive resources, Indian Point Nuclear Facility, Hudson River, and Catskill Aqueduct	3.0
Consideration of alternate design with larger pipe diameter/higher capacity	3.4
Consideration of energy conservation and renewable energy alternatives	3.2
<b>Geology</b>	
Potential Project implications of a seismic risk (i.e., Ramapo Fault)	4.1.5.1
Additive impact of blasting practices near existing quarry in West Roxbury, Massachusetts, within in the New York City Watershed, and Catskill Aqueduct	4.1.4, 4.1.6, 4.3.2, appendix E
<b>Soils</b>

Potential for pipelines to be contaminated with polychlorinated biphenyls	4.8.6.2
<b>Cumulative Impacts</b>	
Concern about additional impacts on ecosystems/communities stressed by existing power plants and heavy industrial activity	4.13
Request for analysis of cumulative climate impacts associated with shale gas development	4.13
Cumulative impacts associated with proposed West Point Partners, LLC West Point Transmission Project	4.13
Cumulative impacts associated with the proposed Atlantic Bridge and Access Northeast Projects	4.13

## 1.5 NON-JURISDICTIONAL FACILITIES

Non-jurisdictional facilities are those facilities related to the Project that are constructed, owned, and operated by others that are not subject to the FERC jurisdiction. There are no known non-jurisdictional facilities associated with the Project.

## 2.0 PROJECT DESCRIPTION

---

### 2.1 PROPOSED FACILITIES

Algonquin proposes to expand its existing natural gas transmission pipeline system in New York, Connecticut, Rhode Island, and Massachusetts. The AIM Project involves construction and operation of about 37.4 miles of replacement, loop, and lateral pipeline facilities; modifications to 6 existing compressor stations; modifications to 24 existing M&R stations; the removal of an existing M&R station; and the construction of 3 new M&R stations as described below. The Project would also involve the abandonment of two segments of existing mainline and four compressor units at one existing compressor station. An overview map of the Project locations and facilities is provided on figure 2.1-1. Detailed maps showing the pipeline routes, aboveground facilities, and pipe and contractor ware yards are contained in appendix B.

#### 2.1.1 Pipeline Facilities

The AIM Project includes about 37.4 miles of pipeline composed of the following facilities:

- replacement of 20.1 miles (in three segments) of existing 26-inch-diameter mainline pipeline with a new 42-inch-diameter pipeline (take-up and relay<sup>1</sup>), including 2.9 miles of new pipeline associated with crossing the Hudson River;
- extension of existing loop<sup>2</sup> pipeline with about 2.0 miles of additional 36-inch-diameter pipeline within Algonquin's existing pipeline right-of-way (Line-36A Loop Extension);
- replacement of about 9.1 miles of existing 6-inch-diameter pipeline with a new 16-inch-diameter pipeline (E-1 System Lateral Take-up and Relay);
- extension of an existing lateral loop pipeline with about 1.3 miles of additional 12-inch-diameter lateral loop pipeline within Algonquin's existing pipeline right-of-way (E-1 System Lateral Loop); and
- installation of about 4.9 miles of new lateral<sup>3</sup> pipeline off of Algonquin's existing I-4 System Lateral (West Roxbury Lateral).

Table 2.1.1-1 summarizes the proposed pipeline facilities associated with the Project.

The majority of the pipeline facilities (about 26.3 miles or 70 percent of the total 37.4 miles) would replace existing Algonquin pipelines, while the remainder of the pipeline facilities (about 11.1 miles or 30 percent) consist of new mainline pipeline (Hudson River crossing, new loop pipeline, and one new lateral pipeline).

---

<sup>1</sup> Take-up and relay refers to a construction method by which an existing pipeline is removed and replaced with a new pipeline in the same location and ditch.

<sup>2</sup> A pipeline loop is a segment of pipe constructed parallel to an existing pipeline to increase capacity.

<sup>3</sup> A pipeline lateral branches off of a mainline pipeline to connect with or serve a specific customer or group of customers.

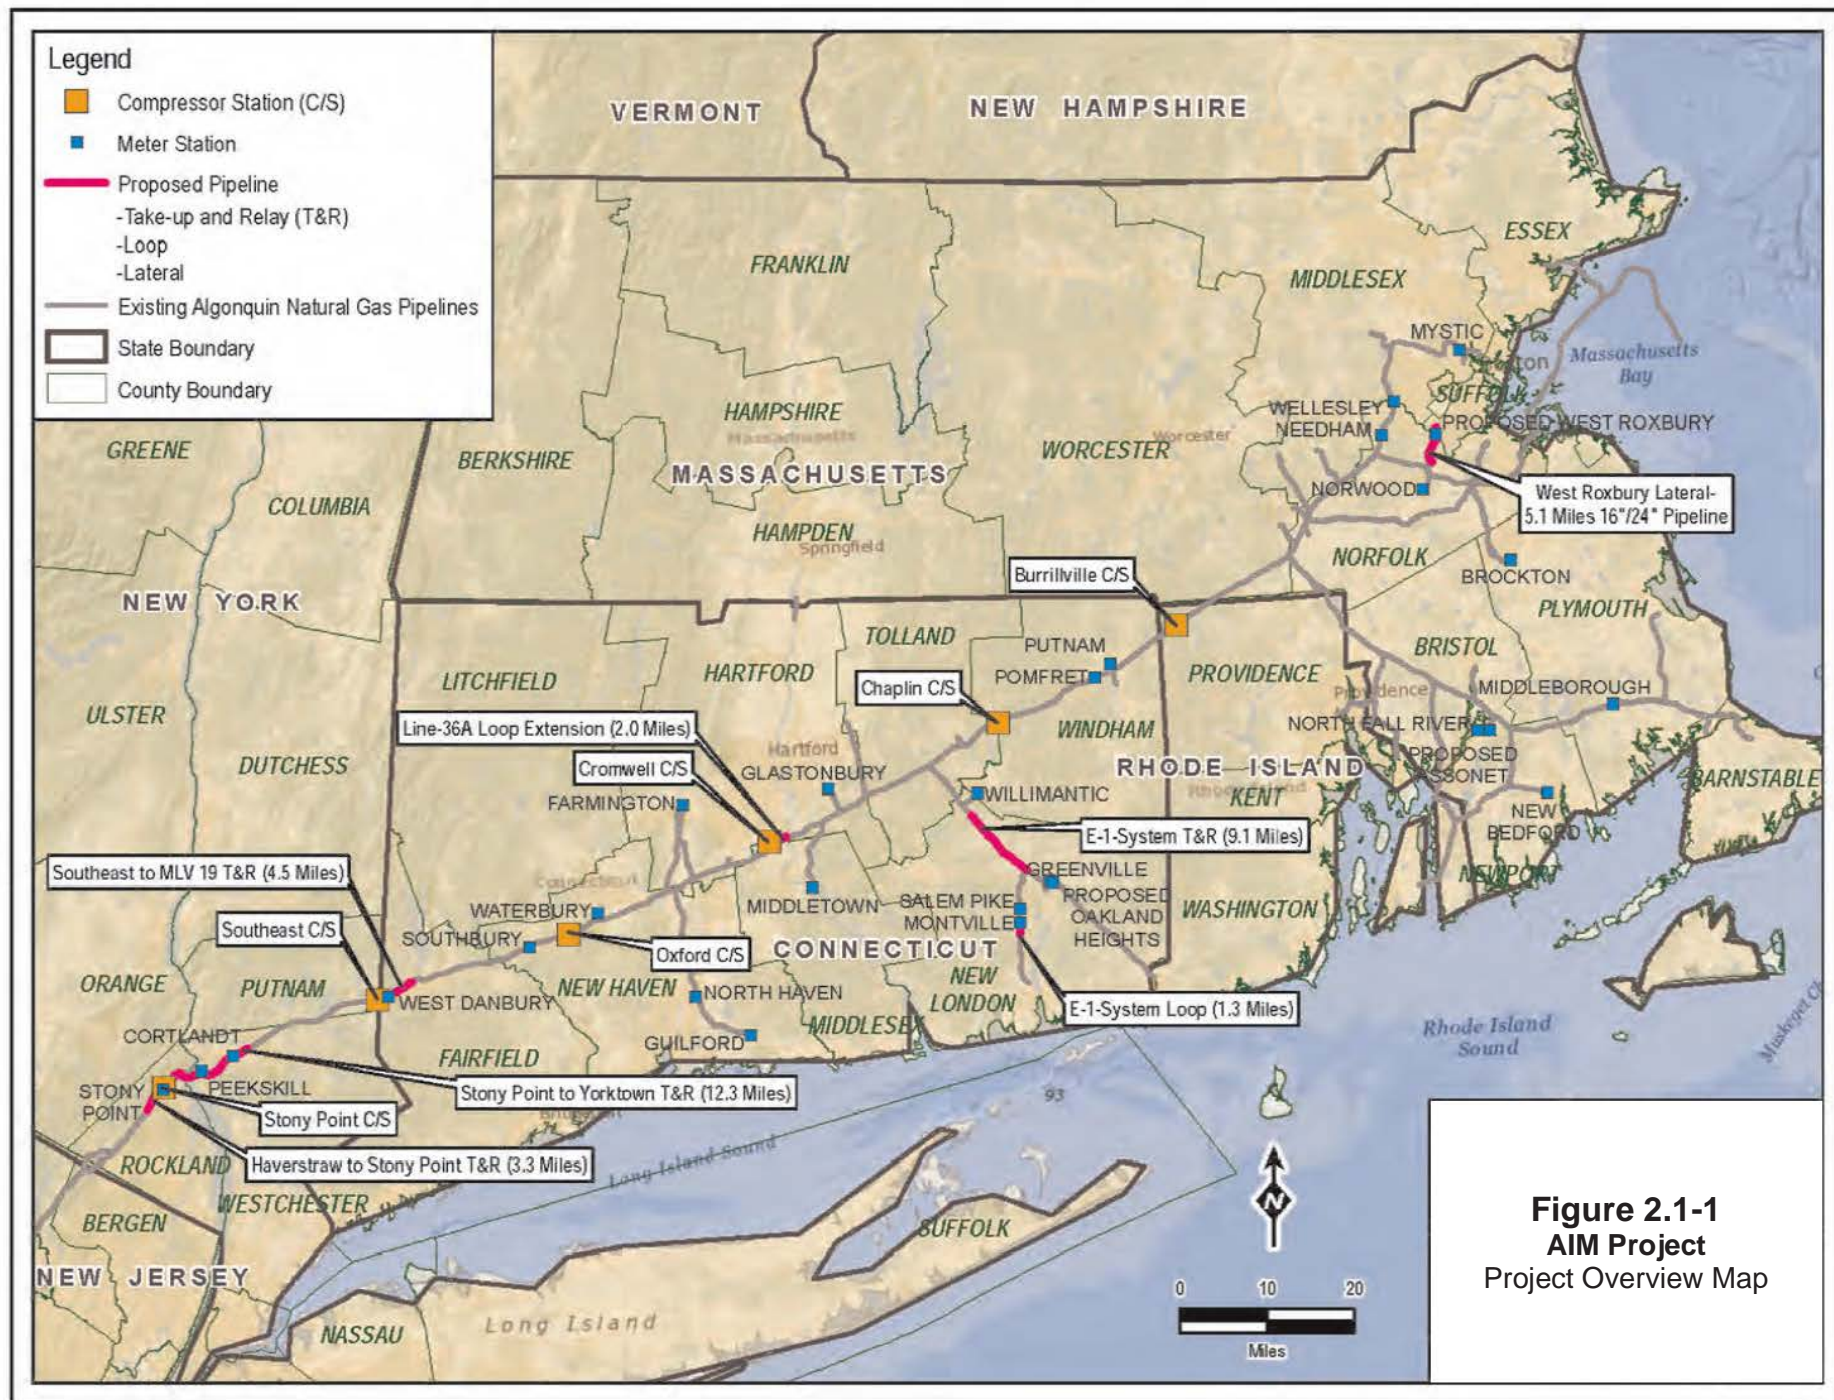

TABLE 2.1.1-1						
Summary of Pipeline Facilities for the AIM Project						
Facility	County, State <sup>a</sup>	Existing Diameter (inches)	New/ Replacement Diameter (inches)	Begin Milepost	End Milepost	Length (miles) <sup>b</sup>
<b>Replacement Pipeline</b>						
Haverstraw to Stony Point Take-up and Relay	Rockland, NY	26	42	0.0	3.3	3.3
Stony Point to Yorktown Take-up and Relay <sup>c</sup>	Rockland, NY	26	42	0.0	3.5	3.5
	Westchester, NY	26	42	3.5	12.3	8.8
Southeast to MLV 19 Take-up and Relay	Putnam, NY	26	42	0.0	0.1	0.1
	Fairfield, CT	26	42	0.1	4.5	4.4
E-1 System Lateral Take-up and Relay	New London, CT	6	16	0.0	9.1	9.1
<b>Loop Extension</b>						
Line-36A Loop Extension	Middlesex, CT	NA	36	0.0	1.8	1.8
	Hartford, CT	NA	36	1.8	2.0	0.2
E-1 System Lateral Loop Extension	New London, CT	NA	12	0.0	1.3	1.3
<b>New Pipeline</b>						
West Roxbury Lateral	Norfolk, MA	NA	16	0.0	3.4	3.4
	Suffolk, MA	NA	16	3.4	4.2	0.7
	Suffolk, MA	NA	24	4.2	5.1	0.8
<b>TOTAL</b>						<b>37.4</b>
<sup>a</sup> No pipeline facilities would be located in Rhode Island.						
<sup>b</sup> The length of the pipeline does not match the mileposting system. This is because several route modifications were incorporated into the proposed route after the mileposting system was established. This specifically affects the West Roxbury Lateral where the changes resulted in an overall decrease in total pipeline length. The changes to the other segments did not result in an overall change in the segment lengths.						
<sup>c</sup> The total pipeline length for the Stony Point to Yorktown Take-up and Relay segment includes an approximately 2.9-mile-long section of new mainline pipeline and right-of-way associated with the crossing of the Hudson River.						
NA = Not applicable						

About 79 percent of the proposed pipeline facilities involve replacement and looping that occurs within or adjacent to existing Algonquin pipeline rights-of-way. The replacement work involves excavating a trench to remove the old pipe. Once the old pipe is removed the trench is re-excavated wider and deeper (as appropriate) to accommodate the new, larger diameter pipe. The replacement pipe would be installed at approximately the same location as the old pipe in the existing Algonquin right-of-way. The loop pipeline installation involves constructing a new pipeline adjacent and parallel with other existing Algonquin pipelines. The pipeline loops require new permanent right-of-way adjacent to the existing Algonquin right-of-way.

### 2.1.1.1 Haverstraw to Stony Point Take-up and Relay

Algonquin would replace about 3.3 miles of 26-inch-diameter mainline pipeline located upstream (southwest) of the existing Stony Point Compressor Station in Rockland County, New York with new 42-inch-diameter mainline pipeline. The installment of the new 42-inch-diameter pipeline would begin at the existing Algonquin MLV 13B (milepost [MP] 0.0) in the Town of Haverstraw and end at the Stony Point Compressor Station located in the Town of Stony Point (MP 3.3). The current maximum allowable operating pressure (MAOP) of the existing 26-inch-diameter mainline is 674 pounds per square inch gauge (psig) and the proposed MAOP of the 42-inch-diameter mainline pipeline is 850 psig.

### **2.1.1.2 Stony Point to Yorktown Take-up and Relay**

Downstream (northeast) of the Stony Point Compressor Station, Algonquin would construct about 12.3 miles of 42-inch-diameter mainline pipeline in the Towns of Stony Point and Cortlandt (including the Hamlet of Verplanck and the Village of Buchanan), the City of Peekskill, and the Town of Yorktown. This pipeline section includes two segments of replacement pipeline and one segment of pipeline construction within a new permanent right-of-way across the Hudson River.

Algonquin would replace about 2.6 miles of 26-inch-diameter mainline pipeline starting at the Stony Point Compressor Station (MP 0.0) and extending to MP 2.6 in the Town of Stony Point. At MP 2.6, the 42-inch-diameter mainline pipeline installation would deviate from Algonquin's existing right-of-way and would be within a new permanent right-of-way as part of the Hudson River crossing until MP 5.5. Algonquin would not remove or replace any of the three existing pipelines that currently cross the Hudson River within the mainline right-of-way (i.e., two existing 24-inch-diameter pipelines and a 30-inch-diameter pipeline). Those existing pipelines across the river do not have sufficient available capacity to accommodate the additional volume of natural gas required by the Project Shippers but Algonquin states that it would maintain service on the three existing pipelines across the river to enhance system reliability (see section 3.5.1). Instead, Algonquin would install the pipeline below the Hudson River bed using the horizontal directional drill (HDD) construction method (see section 2.3.1.2). Between MPs 5.5 and 12.3, Algonquin would replace the existing 26-inch-diameter mainline with the new 42-inch-diameter pipeline. The current MAOP of the existing 26-inch-diameter mainline is 674 psig and the proposed MAOP of the 42-inch-diameter mainline pipeline is 850 psig.

In addition to the replacement pipeline, about 0.2 mile of 26-inch-diameter pipeline would be abandoned in place upon tie-in of the 42-inch-diameter pipeline at the Route 9 crossing. In this location, the pipeline would be offset about 20 feet from the existing 26-inch-diameter line to facilitate installation of the proposed pipeline. Section 2.3.1.2 describes the abandonment procedures that would be followed in this area.

### **2.1.1.3 Southeast to MLV 19 Take-up and Relay**

Algonquin would replace a 26-inch-diameter mainline pipeline segment with 42-inch-diameter pipeline located in Putnam County, New York, and Fairfield County, Connecticut. This 4.5-mile-long replacement segment would begin at the Southeast Compressor Station (MP 0.0) in the Town of Southeast, New York, and extend northeast across the New York/Connecticut state lines into the City of Danbury, Connecticut. Algonquin would install the new 42-inch-diameter pipeline beneath Interstate 84, the Still River, a railroad line, and Mill Plain Road using the HDD construction method (see section 2.3.1.2). The replacement segment would end at Algonquin's existing MLV- 19 site located east of State Route 39 (Clapboard Ridge Road). The current MAOP of the existing 26-inch-diameter mainline is 674 psig and the proposed MAOP of the 42-inch-diameter mainline pipeline is 850 psig.

In addition to the replacement pipeline, about 0.7 mile of Algonquin's existing 26-inch-diameter Southeast to MLV 19 pipeline would be abandoned in place upon tie-in of the 42-inch-diameter pipeline along the Interstate 84/Still River HDD segment. Section 2.3.1.2 describes the abandonment procedures that would be followed in these areas.

### **2.1.1.4 E-1 System Lateral Take-up and Relay**

Algonquin would replace about 9.1 miles of 6-inch-diameter pipeline with 16-inch-diameter pipeline along its existing E-1 System Lateral in New London County, Connecticut. The proposed 16-inch-diameter line would have the same MAOP of 750 psig as the existing 6-inch-diameter line. The replacement would begin at State Route 289 (MP 0.0) in the Town of Lebanon and extend to the southeast through the Town of Franklin, ending approximately 900 feet northwest of Plain Hill Road in the City of Norwich.

#### **2.1.1.5 Line-36A Loop Extension**

Algonquin would extend its existing Line-36A loop pipeline with about 2.0 miles of additional 36-inch-diameter pipeline in Middlesex and Hartford County, Connecticut. The proposed line would be designed for an MAOP of 850 psig. This loop extension would begin at Algonquin's existing Cromwell Compressor Station (MP 0.0) and extend downstream (east) to a termination point located approximately 1,400 feet west of the Connecticut River. The loop extension would be located within the Towns of Cromwell and Rocky Hill.

#### **2.1.1.6 E-1 System Lateral Loop Extension**

Algonquin would extend its existing Line-E-1L pipeline with about 1.3 miles of additional 12-inch-diameter loop pipeline along its existing E-1 System Lateral. The loop pipeline would begin at the existing Montville M&R Station (MP 0.0) located on the north side of Fitch Hill Road and end approximately 1.3 miles to the south, ending about 100 feet north of Raymond Hill Road. The entire loop pipeline would be located within the Town of Montville in New London County, Connecticut. The proposed pipeline would have an MAOP of 750 psig.

#### **2.1.1.7 West Roxbury Lateral**

Algonquin would install about 4.9 miles of new pipeline lateral off of its existing I-4 System Lateral in Norfolk County and Suffolk Counties, Massachusetts to provide Boston Gas with the service it has requested. The West Roxbury Lateral would consist of about 4.1 miles of new 16-inch-diameter pipeline and about 0.8 mile of new 24-inch-diameter pipeline in the Towns of Westwood and Dedham and the West Roxbury section within the City of Boston. The West Roxbury Lateral would have an MAOP of 750 psig.

### **2.1.2 Aboveground Facilities**

The proposed aboveground facilities consist of modifications to six existing compressor stations, to install a total 81,620 hp, in New York, Connecticut, and Rhode Island; and abandon 10,800 hp in New York. Algonquin would modify 24 existing M&R stations in New York, Connecticut, and Massachusetts, including the replacement of existing heaters and metering facilities, piping modifications, and facility uprates, depending on facility needs. The AIM Project also includes the construction of three new M&R stations in Massachusetts and Connecticut to deliver gas to NSTAR, Boston Gas, and Norwich Public Utilities, and the removal of one existing M&R station in Connecticut. Algonquin would also modify three existing MLV sites and five existing launcher/receiver sites, construct five new launcher/receiver sites, construct new MLV cross over piping at two locations, and construct one new MLV. The Project aboveground facilities are described in table 2.1.2-1. The locations of the aboveground facilities are shown on the maps located in appendix B.

In addition to the M&R stations listed in table 2.1.2-1, the AIM Project would also increase gas flow to eight existing Algonquin M&R stations located in Connecticut and Massachusetts. However, the inlet pressure at these facilities would not increase and, therefore, would not result in any station modifications. Two M&R stations are in Hartford County, Connecticut (Bristol M&R Station and Kensington M&R Station) and six stations are in Middlesex, Plymouth, and Norfolk Counties, Massachusetts (Ashland M&R Station, Everett M&R Station, Pine Hills M&R Station, Polaroid M&R Station, Ponkapoag M&R Station, and Weston M&R Station). In addition, there are four M&R stations in Rhode Island and three M&R stations in Massachusetts that are delivery points on the AIM Project. Given that no work is proposed at these 15 existing stations as part of the AIM Project, they have not been included in table 2.1.2-1 or further evaluated in this draft EIS.

TABLE 2.1.2-1

**Proposed New and Modified Aboveground Facilities for the AIM Project**

Facility Type/Facility	County, State	MP <sup>a</sup>	Scope of Work
<b>Existing Compressor Station Modifications</b>			
Stony Point Compressor Station	Rockland, NY	NA	Install two new compressor units; restage <sup>b</sup> one existing compressor unit; install gas cooling for one new unit; install two new heaters; install one new emergency generator; remove existing 26-inch launcher/receiver barrels and MLV assembly; and install new 42-inch MLV and new suction/discharge connections. Four existing compressor units would be abandoned and removed at this location. A net total of 21,000 hp would be added to this station.
Southeast Compressor Station	Putnam, NY	NA	Install one new compressor unit; restage one existing compressor unit; install gas cooler for new unit; install one new heater; install one new emergency generator; remove existing 26-inch launcher barrel and MLV; and install new 42-inch launcher barrel and new MLV and discharge connection. A total of 10,320 hp would be added to this station.
Oxford Compressor Station	New Haven, CT	NA	Restage one existing compressor unit. No additional horsepower would be added to this station.
Cromwell Compressor Station	Middlesex, CT	NA	Install one new compressor unit; install gas cooling for new unit and two existing turbines; install one new heater; install one new emergency generator; shutdown three existing emergency generators; and station piping modifications. A total of 15,900 hp would be added to this station.
Chaplin Compressor Station	Windham, CT	NA	Install one new compressor unit; install gas cooling for new unit and two existing compressor units; install one new heater; install one new emergency generator; shutdown an existing emergency generator; and station piping modifications. A total of 7,700 hp would be added to this station.
Burrillville Compressor Station	Providence, RI	NA	Install one new compressor unit; restage one existing compressor unit; install gas cooling for new unit; install one new heater; install one new emergency generator; and re-pipe existing compressor unit. A total of 15,900 hp would be added to this station.
<b>Existing M&amp;R Station Modifications</b>			
Stony Point M&R Station	Rockland, NY	3.0	Reconnect existing tap to new 42-inch-diameter pipeline.
Peekskill M&R Station	Westchester, NY	5.8	Replace inlet piping; install new heater; and install new regulation equipment.
Cortlandt M&R Station	Westchester, NY	10.3	Replace inlet piping; install new heater; and install new regulation equipment and gas chromatograph.
West Danbury M&R Station	Fairfield, CT	1.2	Upgrade existing facilities and inlet piping for new 850-psig inlet pressure; replace existing ultrasonic meter with new ultrasonic meters and a low flow meter.
Southbury M&R Station	New Haven, CT	NA	Piping modifications; add low flow meter; and increase size of piping.
Waterbury M&R Station	New Haven, CT	NA	Replace existing meter with ultrasonic meters and a low flow meter; upgrade regulation equipment; and replace existing building.
North Haven M&R Station	New Haven, CT	NA	Replace existing meter with ultrasonic meters and a low flow meter.

TABLE 2.1.2-1 (cont'd)

**Proposed New and Modified Aboveground Facilities for the AIM Project**

Facility Type/Facility	County, State	MP <sup>a</sup>	Scope of Work
Guilford M&R Station	New Haven, CT	NA	Rebuild entire station within existing Algonquin property and add filter separator.
Farmington M&R Station	Hartford, CT	NA	Remove upstream pressure regulation; add low flow meter; and upgrade downstream pressure regulation.
Glastonbury M&R Station	Hartford, CT	NA	Replace inlet piping and inlet heater and replace existing meters with ultrasonic meters and low flow meter.
Middletown M&R Station	Middlesex, CT	NA	Add redundant turbine meter run.
Salem Pike M&R Station	New London, CT	NA	Minor modifications to aboveground station piping and regulation equipment.
Montville M&R Station	New London, CT	0.0	Replace existing metering with ultrasonic meters and low flow meter and replace inlet piping from heater to metering.
Willimantic M&R Station	Windham, CT	NA	Rebuild entire station on adjacent new parcel and remove existing M&R station except communications (after new station in-service).
Pomfret M&R Station	Windham, CT	NA	Add redundant meter run.
Putnam M&R Station	Windham, CT	NA	Add redundant meter run.
North Fall River M&R Station	Bristol, MA	NA	Add low flow meter.
New Bedford M&R Station	Bristol, MA	NA	Replace existing metering with ultrasonic meters and low flow meter; replace two existing heaters; and replace existing building.
Middleborough M&R Station	Plymouth, MA	NA	Add redundant meter run and low flow meter.
Brockton M&R Station	Plymouth, MA	NA	Replace existing meters with two ultrasonic meters and low flow meter and replace existing building.
Norwood M&R Station	Norfolk, MA	NA	Replace inlet piping and add new actuator and upgrade metering capacity with new meter runs.
Needham M&R Station	Norfolk, MA	NA	Add redundant meter run.
Wellesley M&R Station	Norfolk, MA	NA	Replace low flow meter with ultrasonic low flow meter.
Mystic M&R Station	Middlesex, MA	NA	Add redundant meter run and a low flow meter and replace existing building.
<b>New M&amp;R Stations</b>			
Oakland Heights M&R Station	New London, CT	NA	Install new metering, regulating, and heating facilities.
Assonet M&R Station	Bristol, MA	NA	Install new metering, regulating, and heating facilities.
West Roxbury M&R Station	Suffolk, MA	4.2	Install new metering, regulating, and heating facilities.
<b>Existing M&amp;R Station Removal <sup>c</sup></b>			
Greenville M&R Station	New London, CT	NA	Remove existing M&R station (after Oakland Heights M&R Station in-service).
<b>Other New Aboveground Facilities</b>			
MLV 13B (Existing)	Rockland, NY	0.0	Remove launcher/receiver facilities and install new piping.
MLV 15 (Existing)	Westchester, NY	11.1	Replace 26-inch valve with 42-inch valve equipped with Remove Control Valve capability and cross over piping.
MLV 19 (Existing)	Fairfield, CT	4.5	Replace 26-inch valve with 42-inch valve equipped with remote control valve capability; install a 26-inch launcher barrel and 42-inch receiver barrel; and install mainline regulators and associated cross over piping.

TABLE 2.1.2-1 (cont'd)			
Proposed New and Modified Aboveground Facilities for the AIM Project			
Facility Type/Facility	County, State	MP <sup>a</sup>	Scope of Work
Launcher/Receiver (Existing)	Rockland, NY	0.0	Remove existing launcher/receiver and install new piping.
L-36A Cromwell Loop Receiver (Existing)	Middlesex, CT	0.0	Remove existing 36-inch receiver facility.
E-1 16-inch Launcher/Receiver (Existing)	New London, CT	0.0	Remove existing 16-inch receiver and 6-inch launcher facilities.
E-1 16-inch Launcher/Receiver (Existing)	New London, CT	9.1	Install 16-inch receiver and 6-inch launcher facilities and valve assembly at end of E-1 16-inch line at existing facility.
E-1 12-inch Launcher (Existing)	New London, CT	0.0	Remove 12-inch receiver.
Launcher/Receiver Pressure Regulating Facility (New)	Westchester, NY	12.3	Install 42-inch receiver barrel and 26-inch launcher barrel and install mainline regulators and associated cross over piping.
L-36A Cromwell Loop Receiver (New)	Hartford, CT	2.0	Install receiver facility, cross over piping, and launcher facilities.
E-1 12-inch Loop Receiver (New)	New London, CT	1.3	Install 12-inch receiver facility and interconnect with E-1 line.
West Roxbury Lateral Launcher/Block Valve (New)	Norfolk, MA	0.0	Install 16-inch launcher facility and lateral block valve at the existing Westwood M&R Station.
West Roxbury Launcher/Receiver (New)	Suffolk, MA	4.2	Install 16-inch receiver and 24-inch launcher facilities as well as lateral block valve at the new West Roxbury M&R Station.
Cross Over Piping (New)	Rockland, NY	2.6	Install new 42-inch MLV cross over piping to both the L30-B and 26-inch mainline and 26-inch launcher facility.
Cross Over Piping (New)	Westchester, NY	5.5	Install new 42-inch MLV cross over piping to both the L30-B and 26-inch mainline and 26-inch receiver facility.
MLV (New)	Putnam, NY	0.0	Install new 42-inch MLV with suction and discharge valves at the Southeast Compressor Station along with a new 42-inch launcher barrel assembly.
<sup>a</sup> MP information is only included for those aboveground facilities located along pipeline segments that are part of the AIM Project pipeline facilities. The remaining aboveground facilities would be located at other points along Algonquin's pipeline system and have been marked as not applicable (NA).			
<sup>b</sup> "Restage" describes work internal to an existing compressor unit that is housed inside a compressor building. It involves removing and replacing certain existing compressor equipment to improve operating efficiency without increasing horsepower.			
<sup>c</sup> The existing Willimantic M&R Station would be removed at its current location but would be rebuilt on an adjacent new parcel.			

## 2.2 LAND REQUIREMENTS

Construction of the Project would impact a total of about 575.6 acres of land, including 450.2 acres for the pipeline facilities, 94.9 acres for the aboveground facilities, 28.6 acres for the pipe and contractor ware yards, and 1.9 acres for access roads. Following construction, about 42.4 acres of new land would be permanently maintained for operation and maintenance of the AIM Project facilities, including about 33.9 acres for the new pipeline right-of-way, 6.6 acres for the aboveground facilities, and 1.9 acres for access roads.

Table 2.2-1 summarizes the land requirements for the AIM Project. A detailed description and breakdown of land requirements and use is presented in section 4.8.1. Typical right-of-way configurations that reflect the majority of the pipeline routes are provided in appendix B.

TABLE 2.2-1			
Summary of Land Requirements for the AIM Project			
Facility	County, State	Land Affected During Construction (acres)	Land Affected During Operation (acres)
<b>PIPELINE FACILITIES<sup>a, b</sup></b>			
<b>Replacement Pipeline</b>

<b>ACCESS ROADS</b>		<b>1.9</b>	<b>1.9</b>
<b>PROJECT TOTAL</b>		<b>575.6</b>	<b>42.4</b>
<sup>a</sup> The acreage shown for the land affected during construction includes all construction workspace, including the existing permanent right-of-way and includes the new land area that would be permanently affected during operation. <sup>b</sup> The acreage shown for the land affected during operation includes only the new permanent right-of-way, not Algonquin's existing permanent easement. <sup>c</sup> The temporary workspace shown for each of these M&R stations falls within the overall pipeline workspace area; therefore, these areas are not included in the acreage calculations. <sup>d</sup> A portion of the West Danbury M&R Station temporary workspace would be located within the pipeline construction workspace (2.6 acres), so the 0.3-acre is the area that would be located outside of the temporary pipeline workspace. <sup>e</sup> Work at the North Fall River M&R Station would take place within the existing station footprint. <sup>f</sup> The acres of land affected during construction at these facilities includes staging areas located a short distance away from the actual M&R station site. <sup>g</sup> This table does not include affected land calculations for MLVs, launcher/receiver facilities, and cross over piping because the land requirements for these facilities are included in the land requirements for the pipeline facilities, compressor stations, or M&R stations above.			

## **2.2.1 Pipeline Facilities**

### **2.2.1.1 Replacement**

Construction of the proposed mainline replacement portions of the AIM Project (Haverstraw to Stony Point, Stony Point to Yorktown, and Southeast to MLV 19 Take-up and Relay) would generally require a 100-foot-wide construction right-of-way to permit the safe passage of equipment and materials associated with construction of the 42-inch-diameter pipeline. This 100-foot right-of-way width does not include special crossing areas such as wetlands and waterbodies, residential areas, and agricultural areas where other construction right-of-way widths would be employed.

In most areas, the construction right-of-way includes the use of Algonquin's existing 75-foot-wide permanent right-of-way. However, there are two segments where Algonquin's existing 75-foot-wide right-of-way would not be part of the construction right-of-way. This includes the new segment of 42-inch-diameter pipeline to be constructed in the Towns of Stony Point and Cortlandt between MPs 2.6 and 5.5 across the Hudson River. In addition, the pipeline segment that crosses the Blue Mountain Reservation in the Town of Cortlandt between Washington Street (MP 6.7) and Maple Avenue (MP 8.4) is located within a 6-foot-wide permanent right-of-way.

Between MPs 2.6 and 5.5 of the Stony Point to Yorktown Take-up and Relay, Algonquin would utilize a 75-foot-wide construction right-of-way and a 50-foot-wide permanent right-of-way. There would be no construction right-of-way within the Hudson River itself with the use of HDD; however, Algonquin would establish a new 10-foot-wide permanent right-of-way across the river for the 42-inch-diameter pipeline. As stated above, Algonquin would not be removing or abandoning any of the existing pipelines that cross the Hudson River in the existing permanent easement to the north of the proposed crossing location.

For the E-1 System Lateral Take-up and Relay segment, Algonquin would utilize a 75-foot-wide construction right-of-way to accommodate construction of the 16-inch-diameter pipeline. The construction right-of-way would include Algonquin's existing 50-foot-wide permanent right-of-way in these areas and an additional 25 feet of temporary workspace. Algonquin's existing permanent right-of-way for the rest of the E-1 System Lateral is 60 feet. As part of the AIM Project, Algonquin would obtain an additional 10 feet of new permanent right-of-way along the portions of this segment where the current right-of-way is only 50 feet to match the rest of the system.

### **2.2.1.2 Loop Extension**

Algonquin would use an 85-foot-wide construction right-of-way to construct the Line-36A Loop to permit the safe passage of equipment and materials associated with construction of the 36-inch-diameter pipeline. The existing permanent right-of-way width along the Line-36A Loop Extension is 75 feet. The proposed construction right-of-way would include the use of the existing permanent right-of-way, to the extent practicable, and an additional 10 to 35 feet of temporary workspace. Algonquin would obtain an additional 20 to 30 feet of new permanent right-of-way for the Line-36A Loop Extension.

Algonquin would use a 75-foot-wide construction right-of-way for the E-1 System Lateral Loop Extension. The construction right-of-way would include the use of Algonquin's existing 30-foot-wide permanent easement, an additional 20 feet of new permanent right-of-way, and an additional 25 feet of temporary workspace. Algonquin would obtain an additional 20 feet of new permanent right-of-way along the E-1 System Lateral Loop Extension segment.

### **2.2.1.3 New Pipeline**

The West Roxbury Lateral would be primarily constructed along and within existing roads and in parking lots of commercial and industrial properties. The construction right-of-way would range between 15 and 75 feet in width. In public roadways, Algonquin would seek to obtain a permit or license agreement for the installation from the City of Boston and the Town of Dedham. The distribution of the construction right-of-way would vary depending on the location. Where there is sufficient room, the distribution of the construction right-of-way would be 25 feet on the spoil side and 50 feet on the working side. In sections where the new pipeline parallels existing road or property lines, the construction right-of-way would vary between 15 and 75 feet to accommodate field conditions at the time of construction. Where the pipeline is within existing streets, the construction right-of-way would be limited to the limits of the street right-of-way. The permanent right-of-way width for the West Roxbury Lateral would be 50 feet, where available.

### **2.2.1.4 Collocation with Existing Rights-of-Way**

About 35.0 miles (93 percent) of the 37.4 miles of AIM Project pipeline facilities would be within or adjacent to existing right-of-way, consisting of Algonquin pipeline rights-of-way, public roadways, railways, and electric transmission line corridors. Table 2.2.1-1 provides locations by milepost where the AIM Project pipeline segments would be collocated with existing rights-of-way.

The Haverstraw to Stony Point Take-up and Relay segment would be entirely collocated with existing corridors, including Algonquin's existing 30-inch-diameter loop pipeline and an Orange and Rockland Utilities, Inc. transmission line corridor.

About 10.4 miles (85 percent) of the 12.3-mile-long Stony Point to Yorktown Take-up and Relay segment would also be collocated with existing utility corridors, including Algonquin's 30-inch-diameter loop pipeline; an Orange and Rockland Utilities, Inc. transmission line corridor; and a Consolidated Edison, Inc. transmission line corridor. The only exception to this would be a portion of the new permanent right-of-way proposed along the section of the 42-inch-diameter pipeline to be installed in the Town of Stony Point and the Town of Cortlandt. About 1.8 miles (62 percent) of this 2.9-mile new pipeline segment would not be adjacent to existing corridors.

The Southeast to MLV 19 Take-up and Relay, Line-36A Loop Extension, and E-1 System Lateral Loop Extension segments would be entirely collocated with Algonquin's existing pipeline easements.

The E-1 System Lateral Take-up and Relay would be collocated with Algonquin's existing 10-inch-diameter E-1 Pipeline, as well as a Connecticut Light & Power transmission line.

About 4.5 miles (92 percent) of the 4.9-mile-long West Roxbury Lateral would be collocated within or adjacent to existing roadways. Primary roads utilized for routing include Providence Highway, Washington Street, Grove Street, and Centre Street. The pipeline would also cross Interstate 95/State Route 128.

TABLE 2.2.1-1			
Summary of Existing Rights-of-Way Adjacent to Pipeline Facilities for the AIM Project			
Facility	County, State/Municipality	MP Range	Length Adjacent to or Within Existing Right-of-Way (miles)
Replacement			
Haverstraw to Stony Point Take-up and Relay	Rockland, NY/Haverstraw	0.0 to 1.2	1.2
	Rockland, NY/Stony Point	1.2 to 3.3	2.1
Stony Point to Yorktown Take-up and Relay	Rockland, NY/Stony Point	0.0 to 2.6	2.6
		2.7 to 2.8	0.1
		3.0 to 3.1	0.1
	Westchester, NY/Cortlandt	4.2 to 4.6	0.4
		5.0 to 5.4	0.4
		5.5 to 11.0	5.5
	Westchester, NY/Yorktown	11.0 to 12.3	1.3
Southeast to MLV 19 Take-up and Relay	Putnam, NY/Southeast	0.0 to 0.1	0.1
	Fairfield, CT/Danbury	0.1 to 4.5	4.4
E-1 System Lateral Take-up and Relay	New London, CT/Lebanon	0.0 to 3.9	3.9
	New London, CT/Franklin	3.9 to 8.4	4.5
	New London, CT/Norwich	8.4 to 9.1	0.7
Loop Extension			
Line-36A Loop Extension	Middlesex, CT/Cromwell	0.0 to 1.8	1.8
	Hartford, CT/Rocky Hill	1.8 to 2.0	0.2
E-1 System Lateral Loop Extension	New London, CT/Montville	0.0 to 1.3	1.3
New Pipeline			
West Roxbury Lateral	Norfolk, MA/Westwood	0.4 to 0.5	0.1
	Norfolk, MA/Dedham	0.6 to 2.4	1.8
		2.5 to 3.4	0.9
	Suffolk, MA/West Roxbury	3.4 to 4.9	1.5

### 2.2.1.5 Additional Temporary Workspace

In addition to the construction right-of-way configurations described above, Algonquin identified a wider construction workspace in several locations due to:

- utility and existing pipeline cross-overs;
- wetland and waterbody crossings;
- road crossings;
- side slope construction;
- topsoil segregation requirements;
- extra trench depth;
- shallow bedrock and potential associated disposal of excess blast rock; and
- parking areas.

Table C-1 in appendix C identifies the areas where Algonquin would require additional temporary workspace (ATWS), their dimensions, the acreage of impact, the justification for their use, and whether or not they require a modification from the Erosion and Sediment Control Plan (E&SCP) (see section 2.3).

### **2.2.2 Aboveground Facilities**

The AIM Project would use about 94.9 acres of temporary workspace for the construction activities associated with the aboveground facilities and about 6.6 acres of land would be permanently maintained for operations (see table 2.2-1). For the compressor stations, Algonquin would use about 79.5 acres of temporary workspace during construction within its existing properties; no new property would be required for the compressor station modifications. Temporary workspace areas include the existing developed station yards and access roads as well as some open land and wooded areas immediately surrounding the developed station site within Algonquin's property. At the Chaplin, Burrillville, and Southeast Compressor Stations, these wooded temporary workspace areas would be cleared for use during construction and allowed to naturally revegetate following post-construction restoration. No additional area would be permanently maintained. However, at the Stony Point and Cromwell Compressor Stations, a portion of the wooded areas cleared within Algonquin's existing property lines during construction would be permanently maintained as part of the facility operations. The 1.6-acre permanent impact area at the Stony Point Compressor Station consists of a wooded portion of the site that would be occupied by a portion of the AIM Project compressor building, cooler units, and the suction and discharge pipelines. At the Cromwell Compressor Station, the 1.9-acre wooded area in the northeast corner of the station site would be maintained in a non-forested state following completion of construction associated with the AIM Project to facilitate station operations. Modification work at the existing Oxford Compressor Station would take place entirely within the existing compressor building and would not require any temporary workspace or new permanent impact.

Algonquin would use about 15.4 acres of temporary workspace during construction at the existing M&R stations (11.2 acres), new M&R stations (3.9 acres), and the removal of the Greenville M&R Station (0.3 acre) (see table 2.2-1). For the existing M&R stations, Algonquin would use the developed station yards and in some cases adjacent pipeline rights-of-way and open land for temporary workspace. About 3.1 acres of new land would be permanently affected as part of the operation of the three new M&R stations (2.6 acres) and the rebuild of the Willimantic M&R Station (0.5 acre) on a new property adjacent to the existing station site.

None of the other proposed aboveground facilities would require additional land for construction or operation. The acreage for these facilities is included in the acreage associated with the pipeline facilities, compressor stations, or M&R stations.

### **2.2.3 Pipe and Contractor Ware Yards**

To support construction activities, Algonquin plans to use four pipe yards in Connecticut and New York on a temporary basis. These yards would be used by the contractor and/or Algonquin to stage personnel, equipment, new pipe, and other materials necessary for construction of the facilities, and could include contractor trailers, construction equipment, fuel/lubricant storage, and vehicle parking. Table 2.2.3-1 presents the land requirements for currently identified pipe yards and contractor ware yards proposed for temporary use during construction of the AIM Project facilities. The locations of these pipe yard sites are shown on the maps provided in appendix B. Upon completion of construction, yards would be restored to the extent practicable and allowed to revert to previous land uses.

TABLE 2.2.3-1			
Pipe and Contractor Ware Yards for the AIM Project			
State/Yard Name	Location	Size (acres)	Existing Land Use
Dansville-NY Yard	9431 Foster Wheeler Road, Dansville, NY	20.0	Industrial storage yard.
Danbury – CT Yard	93 Mill Plain Road, Danbury, CT	3.0	Construction equipment storage yard.
Franklin – CT Yard	32 New Park Road Franklin, CT	5.6	Box trailer truck parking lot used previously for an Algonquin project.
<b>Project Total</b>		<b>28.6</b>	

## 2.2.4 Access Roads

To the extent feasible, Algonquin would use existing public and private road crossings along the proposed Project routes as the primary means of accessing pipeline rights-of-way and aboveground facilities. In addition to the existing access available by the use of public roads, Algonquin has identified a total of 36 access roads for use on the AIM Project, including 28 temporary access roads (TAR) and 8 permanent access roads (PAR). With one exception, the existing roads are comprised of gravel roads, unimproved dirt roads, paved and gravel driveways, private industrial and commercial roads, paved parking lots, and golf course roads. The exception is a new PAR to be constructed for the new Assonet M&R Station.

Although Algonquin would be using existing roads for temporary and permanent access, seven of these existing roads would require minor upgrades and/or widening (by about 10 feet) to accommodate use during pipeline construction. These upgrades would result in about 1.9 acres of new land disturbance. Algonquin would also need to construct one new PAR from the existing North Fall River M&R Station site to the new Assonet M&R Station. This new PAR would permanently disturb less than 0.1 acre (0.03 acre) of land.

At the new Oakland Heights M&R Station, Algonquin would utilize Oakland Drive, an existing 25-foot-wide private paved road off of Hunters Road in the City of Norwich, to access the new M&R site for operation. No road upgrades are required for this new PAR. Table 2.2.4-1 identifies the locations of new and existing access roads associated with the AIM Project.

## 2.3 CONSTRUCTION PROCEDURES

The AIM Project would be designed, constructed, operated, and maintained to conform to, or exceed, the minimum federal safety standard requirements of PHMSA in 49 CFR 192,<sup>4</sup> and other applicable federal and state regulations, including U.S. Department of Labor, Occupational Safety and Health Administration (OSHA) requirements. These regulations are intended to ensure adequate protection for the public. Among other design standards, Part 192 specifies pipeline material and qualification, minimum design requirements, and protection from internal, external, and atmospheric corrosion.

<sup>4</sup> Pipe design regulations for steel pipe are contained in subpart C, Part 192. Section 192.105 contains a design formula for the pipeline's design pressure. Sections 192.107 through 192.115 contain the components of the design formula, including yield strength, wall thickness, design factor, longitudinal joint factor, and temperature derating factor, which are adjusted according to the project design conditions, such as pipe manufacturing specifications, steel specifications, class location, and operating conditions. Pipeline operating regulations are contained in subpart L, Part 192.

						<b>Total: 1.9</b>
<sup>a</sup> Existing PARs currently used by Algonquin's Pipeline Operations Department at existing M&R station and compressor station facilities are not shown on this table or included as part of the Project. <sup>b</sup> These roads would need to be upgraded for use by the project. The roads would be upgraded to a width of 20 feet. <sup>c</sup> These roads would be graded and graveled as required for use by the project. <sup>d</sup> This new permanent access road would be 12 feet wide. NA = Not Applicable						

To reduce construction impacts, Algonquin would implement the AIM Project-specific E&SCP.<sup>5</sup> The E&SCP is based on the mitigation measures contained in the FERC's Upland Erosion Control, Revegetation, and Maintenance Plan (Plan) and FERC's Wetland and Waterbody Construction and Mitigation Procedures (Procedures),<sup>6</sup> as well as guidelines from the USACE and the FWS. We reviewed the E&SCP, found it to be acceptable, and have determined that Algonquin's adherence to the requirements in the E&SCP would reduce the impacts of the Project. As indicated in table C-1 in appendix C, the use of several ATWS would require alternative measures from the FERC's Plan and Procedures. These are discussed in more detail in sections 4.3.2.4 and 4.4.4. The E&SCP is further discussed in sections 4.2.2 and 4.4.3.

<sup>5</sup> Algonquin's E&SCP was included as appendix 1B to Resource Report 1 in its February 28, 2014 application (Accession No. 20140228-5269). The E&SCP can be viewed on the FERC website at <http://www.ferc.gov>. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20140228-5269 in the "Numbers: Accession Number" field.

<sup>6</sup> The FERC Plan and Procedures are a set of construction and mitigation measures that were developed in collaboration with other federal and state agencies and the natural gas pipeline industry to minimize the potential environmental impacts of the construction of pipeline projects in general. The FERC Plan can be viewed on the FERC Internet website at <http://www.ferc.gov/industries/gas/enviro/plan.pdf>. The FERC Procedures can be viewed on the FERC Internet website at <http://www.ferc.gov/industries/gas/enviro/procedures.pdf>.

To avoid or minimize the potential for harmful spills and leaks during construction, Algonquin developed an acceptable Spill Prevention, Control and Countermeasure Plan/Preparedness, Prevention, and Contingency Plan for the Algonquin Incremental Market Project (SPCC Plan).<sup>7</sup> The SPCC Plan describes spill and leak preparedness and prevention practices, procedures for emergency preparedness and incident response, and training requirements. Additional discussion of the SPCC Plan is presented in sections 4.2.2.6, 4.3.1.7, and 4.3.2.6.

Other resource-specific plans that have been developed for the proposed Project are discussed in more detail in section 4.0.

### 2.3.1 Pipeline Facilities

The AIM Project pipeline facilities would be located in a wide variety of land use settings. For example, the mainline replacement segments in New York and Connecticut include areas of undeveloped woodlands, steep rocky slopes, suburban residential neighborhoods, and moderately populated urban areas. In contrast, the E-1 System Lateral Take-up and Relay and E-1 System Lateral Loop Extension segments would be located in rural areas with low-density residential population and abundant agricultural land. The proposed West Roxbury Lateral would be located in a densely developed urban area. Given the wide mix in land use types in the Project construction areas, several construction techniques would be utilized for the Project as described in the following sections.

Table 2.3.1-1 provides a summary of Algonquin's proposed construction methods for the Project. The construction methods are further described in sections 2.3.1.1 and 2.3.1.2. Table D-1 in appendix D provides a comprehensive listing of proposed construction techniques by milepost.

TABLE 2.3.1-1	
Approximate Mileage by Construction Method for the AIM Project	
Construction Method	Length (miles)
Standard	21.5
Drag-section	10.1
In-street <sup>a</sup>	4.1
Bore	0.3
HDD	1.4
<b>Total</b>	<b>37.4</b>
<sup>a</sup> In-street construction may involve a variety of construction methods including stove-pipe, drag-section, or open cut.	

<sup>7</sup> Algonquin's SPCC Plan was provided as part of its responses to the April 10, 2014 FERC Environmental Data Request filed on April 30, 2014 (Accession No. 20140430-5528). The SPCC Plan can be viewed on the FERC website at <http://www.ferc.gov>. Using the "eLibrary" link, select "Advanced Search" from the eLibrary menu and enter 20140430-5528 in the "Numbers: Accession Number" field.

### **2.3.1.1 General Pipeline Construction Procedures**

Standard pipeline construction consists of specific activities that make up a linear construction sequence (see figure 2.3.1-1). The required construction activities include the following:

- surveying and staking
- clearing operations, where required;
- right-of-way and temporary construction workspace grading;
- trench excavation;
- blasting, where required;
- pipe stringing, bending, and welding;
- lowering-in, tie-ins, and backfilling;
- cleaning and hydrostatic testing; and
- cleanup and restoration.

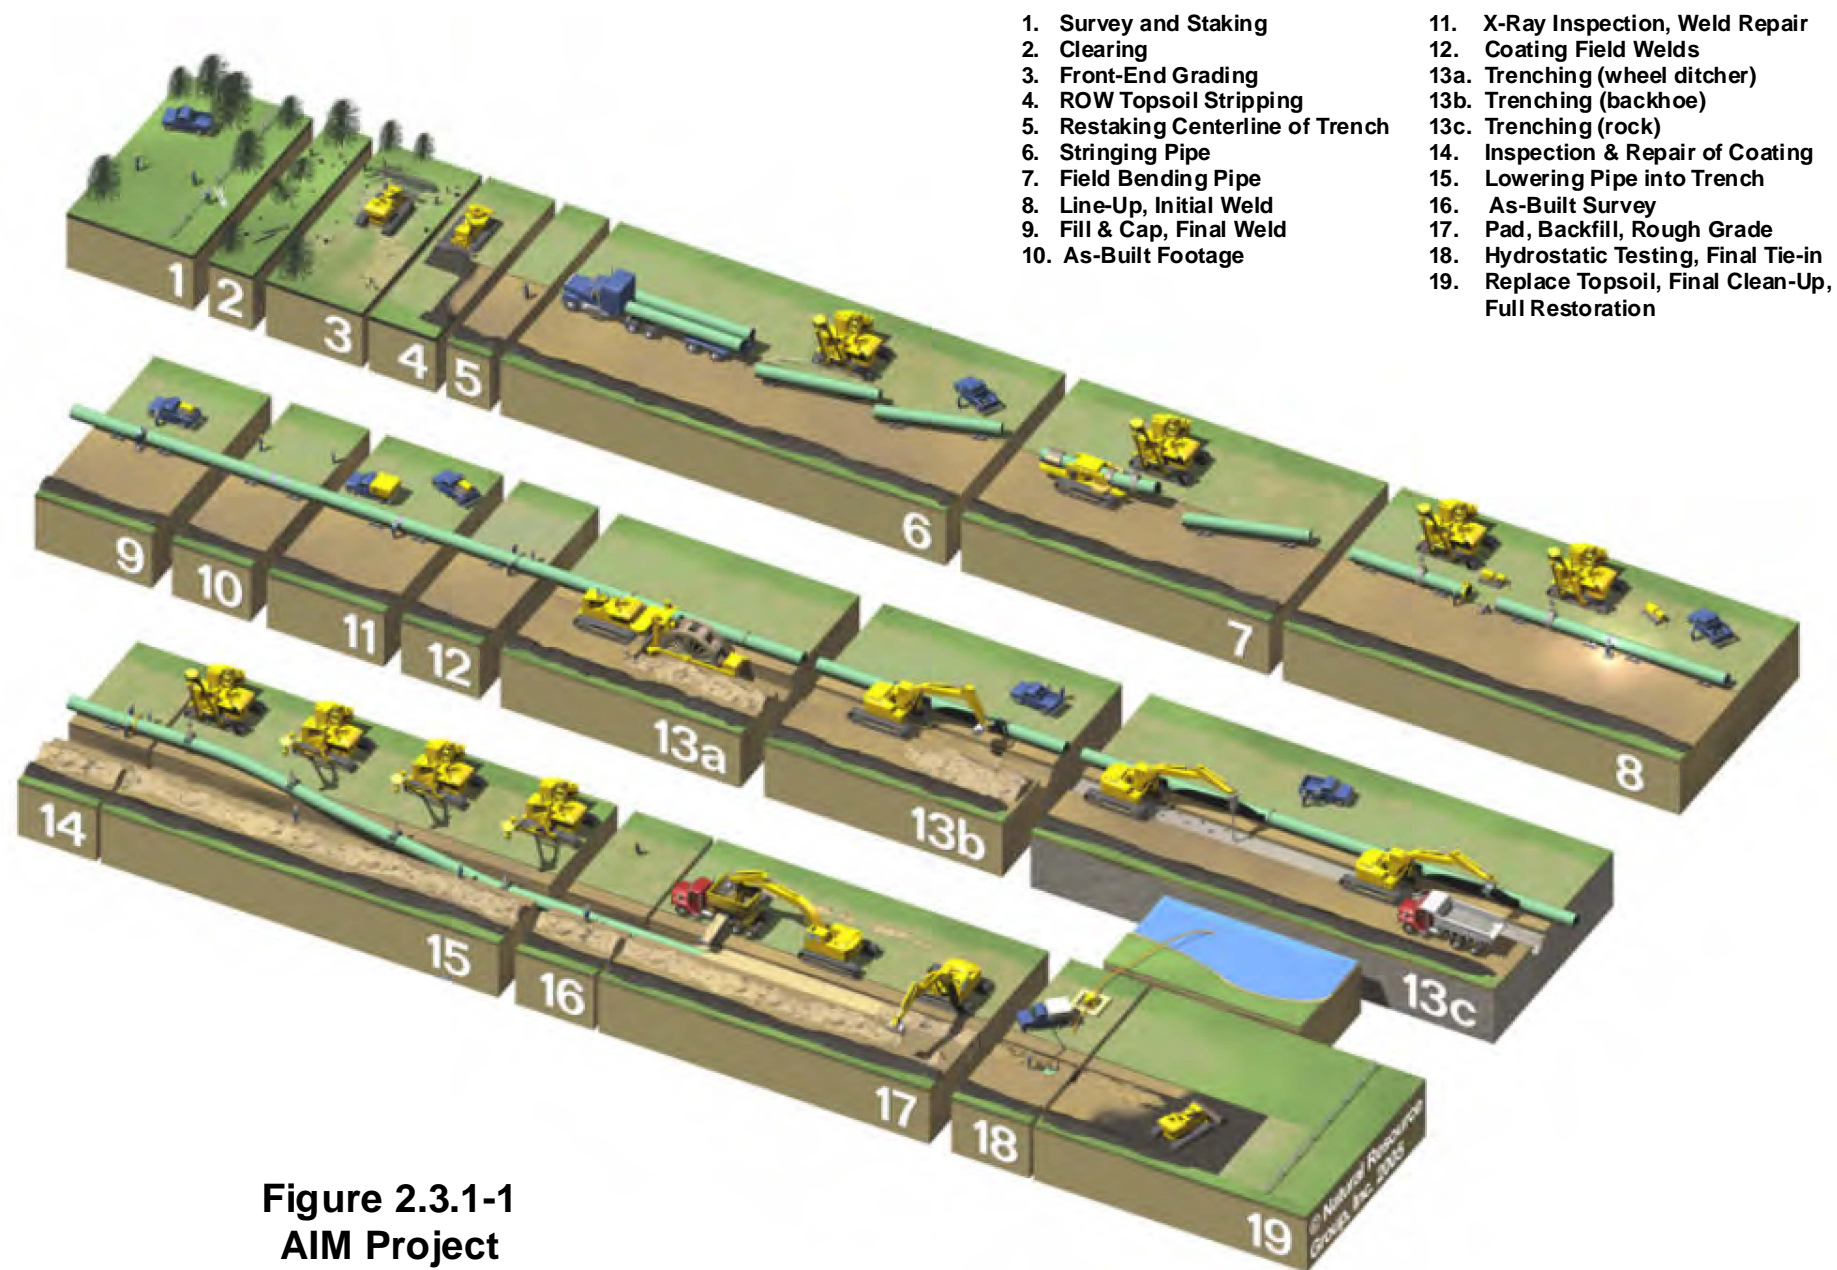

#### **Surveying and Staking**

Algonquin would notify affected landowners before initiating preconstruction surveys. A crew would then survey and stake the outside limits of the construction work areas, centerline location of the pipeline, road crossings, and any ATWS, such as lay down areas or at stream crossings. The “One Call” system of each state would be contacted and underground utilities (e.g., cables, conduits, and pipelines) would be located and flagged.

#### **Clearing Operations**

Clearing would be minimized for construction of the Project because existing pipeline rights-of-way, roadways, utility rights-of-way, and other industrial and commercial sites would be used for a significant portion of the construction right-of-way. The primary clearing work for the Project would occur in the temporary construction workspace beyond Algonquin’s existing maintained right-of-way. Initial clearing operations would include the removal of vegetation within the pipeline right-of-way and the temporary construction workspace either by mechanical or hand cutting methods. The limits of clearing would be identified and flagged in the field before beginning any clearing operations. In wetlands, trees and brush would either be cut with rubber-tired and/or tracked equipment, or hand-cut. Unless grading is required for safety reasons, wetland vegetation would be cut off at ground level, leaving existing root systems intact, and the aboveground vegetation removed from the wetlands for chipping or disposal. In uplands, tree stumps and rootstock would be left in the temporary workspace, wherever possible, to encourage natural revegetation. Stumps would be removed from the right-of-way to approved disposal locations. Brush and tree limbs would be chipped and removed from the right-of-way for approved disposal.

The cleared width within the right-of-way and temporary construction workspace would be kept to the minimum that would allow for spoil storage, staging, assembly of materials and all other activities required to safely construct the pipeline. Following clearing and before grading activities, erosion controls would be installed at the required locations as outlined in Algonquin’s E&SCP, and maintained throughout the construction process.

**Figure 2.3.1-1**  
**AIM Project**  
**Typical Pipeline Construction Sequence**

## **Right-of-Way and Temporary Construction Workspace Grading**

The entire width of the construction right-of-way, including the temporary construction workspace, would be rough graded as necessary to allow for safe passage of equipment and to prepare a work surface for pipeline installation activities. Typically, the grading of the right-of-way would be completed with bulldozers. Backhoes would be used in conjunction with bulldozers in areas where boulders and tree stumps require removal. A travel lane or traffic control would be maintained to allow for the passage of daily traffic.

The mainline replacement pipeline facilities cross numerous residential properties. At these locations, topsoil would be stripped and stockpiled separately from the subsoil during grading. There may be some areas where the construction right-of-way is limited and topsoil would need to be stockpiled offsite. Topsoil would be replaced with appropriate imported material as required. The mixing of topsoil with subsoil would be minimized by using topsoil segregation construction methods in active agricultural lands and wetlands (except when standing water or saturated soils are present).

## **Trench Excavation**

A trench would be excavated by a backhoe to the proper depth to allow for the burial of the pipe. The trench would be deep enough (about 7 feet deep for the 42-inch-diameter mainline pipeline and 36-inch-diameter loop extension pipeline and 6 feet deep for the 24-, 16-, and 12-inch-diameter loops and laterals) to provide for a minimum of 3 feet of cover over the pipe after backfilling; however, the smaller diameter pipelines could be installed with less than 3 feet of cover in areas of shallow bedrock. Deeper burial may be required in specific areas. The excavated material would be placed next to the trench or in approved ATWS or trucked offsite so as to avoid unnecessary movement of machinery across the terrain.

Dewatering of the pipeline trench may be required in areas with a high water table or after a heavy rain. All trench water would be discharged into well-vegetated upland areas or properly constructed dewatering structures to allow the water to infiltrate back into the ground. If trench dewatering is necessary in or near a waterbody, the removed trench water would be discharged into an energy dissipation/sediment filtration device, such as a geotextile filter bag or straw bale structure located away from the water's edge to prevent heavily silt-laden water from flowing into nearby waterbodies in accordance with the AIM Project's E&SCP and all applicable permits.

A discussion on contaminated groundwater or soil that could be encountered during construction of the AIM Project is provided in sections 4.2.1.5 and 4.3.1.6.

## **Rock Removal and Blasting**

Given the presence of surface rock in large portions of the Project area, blasting for rock removal would be required during construction of the AIM Project. Rock encountered during trenching would be removed using one of the techniques listed below. The technique selected is dependent on the relative hardness, fracture susceptibility, and expected volume of the material. Techniques include:

- conventional excavation with a backhoe;
- ripping with a bulldozer followed by backhoe excavation;
- hammering with a pointed backhoe attachment followed by backhoe excavation; or
- a combination of drilling holes to weaken the rock and hammering or ripping to fragment the rock.

If it is determined that the bedrock cannot be removed by conventional techniques, blasting options may include:

- blasting followed by backhoe excavation; or
- blasting surface rock prior to excavation.

If blasting is required for the Project, it would be conducted in accordance with Algonquin's Rock Removal Plan (see appendix E) as well as applicable state blasting codes and any local blasting requirements. All blasting activity would be performed by state-licensed professionals according to strict guidelines designed to control energy release. Proper safeguards would be taken to protect personnel and property in the area. This includes conducting preconstruction surveys of homes and businesses, as approved by the landowner. Blasting mats or soil cover would be used as necessary to prevent the scattering of loose rock. Blasting would be conducted during daylight hours and would not begin until occupants of nearby buildings, stores, residences, and places of business have been notified. Algonquin would comply with applicable regulations that apply to blasting and blast vibration limits with regard to structures and underground utilities. Rock removal and blasting are further discussed in section 4.1.6 and in Algonquin's Rock Removal Plan (see appendix E). We have reviewed the Rock Removal Plan and find it to be acceptable.

### **Pipe Stringing, Bending, and Welding**

Once the trench is excavated, the next process in standard pipeline construction is stringing the pipe along the trench. Stringing involves initially hauling the pipe by tractor-trailer, generally in 40-foot lengths from the pipe storage yard, onto the right-of-way. The pipe would be off-loaded from trucks and placed next to the trench using a side-boom tractor. The pipe joints would be lined up end-to-end to allow for welding into continuous lengths known as strings. For pipe construction in urban areas, Algonquin would likely utilize mini-crews where the pipe would be hauled to the work site daily. Some pipe may be stockpiled on the right-of-way and would be fenced and stabilized if left over night.

Once the sections of pipe have been placed on the right-of-way, the pipe is bent as necessary so the pipe fits the horizontal and vertical contours of the excavated trench. Pipe is usually bent with a hydraulic pipe-bending machine.

Professional welders qualified according to applicable industry standards and Algonquin's requirements would weld the joints of pipe together in two steps. The front-end welding crew would clean and align the pipe bevels in preparation for welding and place at least the first two passes in the welding process. The back-end welders would complete the welds started by the front-end welders. The pipe is welded into long strings to minimize the number of welds that have to be made in the trench (tie-in welds).

Each weld is inspected by an independent certified Non Destruction Test technician to ensure its structural integrity is consistent with 49 CFR 192 of PHMSA's regulations. X-ray or ultrasonic images are taken and processed on site for virtually instantaneous results. Those welds that do not meet the Algonquin's specifications would be repaired or replaced and re-inspected.

The pipeline is coated to prevent corrosion. The pipe lengths would be coated (usually with a heat-applied epoxy) at a coating mill prior to being delivered to the Project. The ends of each piece are left bare to allow for welding. After welding, the weld area is field coated by the coating crew. Because pipeline coatings are electrically insulating, the coating is inspected using equipment that emits an electric charge to ensure there are no locations on the pipeline with a defect in the coating.

## **Lowering-in, Tie-Ins, and Backfilling**

After a pipe string has been coated and inspected, the trench is prepared for the installation of the pipeline. The trench is cleared of loose rock and debris. If water exists in the trench, the water is pumped out into a well-vegetated upland area and/or into an approved filter with the exception of wetland areas where the “push pull” installation may be required. In sandy soils, the trench is shaped to support the pipe. In areas where the trench contains bedrock, a sand bedding is placed on the bottom of the trench, and/or pads made of sandbags and/or clay are placed at regular intervals along the trench bottom to support the pipe. The lowering-in crew places the pipeline in the trench, usually with side-boom tractors.

Once the sections of pipe are lowered-in, the tie-in crew makes any final welds in the trench. Additional excavations as needed, lowering-in, lining up, welding, weld nondestructive inspection, and coating the final welds are accomplished by this crew.

All suitable material excavated during trenching would be redeposited into the trench. Where excavated material is unsuitable for backfilling, then additional select fill may be required. If the soil is rocky, the pipe would be padded with relatively rock-free material placed immediately around the pipe. This material may be obtained from commercial areas in the region. Where suitable, the subsoil may be mechanically screened to produce suitable padding material. Padding of the pipe is usually performed with backhoes. If padding is obtained from an offsite source, it is normally placed in the trench by front-end loaders. Topsoil would not be used as padding material. Once the pipe is padded, the trench is then backfilled with suitable excavated subsoil material. Before the completion of backfilling 12-inches below natural grade, 24-inch-wide bright yellow warning tape would be installed designating the location of the pipeline below. The yellow tape would have a warning notice indicating the presence of a high-pressure natural gas pipeline and provide Algonquin’s toll free number for contact. The top of the trench may be slightly crowned to compensate for settling except for paved areas, where standard compaction methods would be employed. The topsoil is then spread across the graded construction right-of-way when applicable. The soil would be inspected for compaction, and scarified as necessary.

## **Cleaning and Hydrostatic Testing**

Once the pipeline tie-ins are completed, it is internally cleaned with pipeline “pigs.” A manifold is installed on one end of the long pipeline section and a pig is propelled by compressed air through the pipeline into an open pig catcher to remove any dirt, water, or debris that was inadvertently collected within the pipeline during installation.

After cleaning, the pipeline segments would be pressure tested in accordance with Algonquin’s requirements to ensure that they are capable of operating safely at the intended design pressure. Hydrostatic testing would be conducted in accordance with applicable permits, and no chemicals would be added to the test water. The pipeline is hydrostatically tested with water that is normally obtained from water sources crossed by the pipeline, including available municipal supply lines. See section 4.3.2.5 for a discussion on water source(s) and quantities that would be required to hydrostatically test each of the AIM Project facilities. The water propels a pig through the pipeline in a manner that fills the pipeline with water. Test pressure is obtained by adding water to the test section of the pipeline with a high-pressure pump. At the completion of the hydrostatic test, the pressure is removed from the section and the water is released from the test section by propelling the pig with air, which forces the water from the pipeline. Additional “drying” pig runs are made, if necessary, to remove any residual water from the pipeline. All hydrostatic test water would be discharged within suitable vegetated upland areas in accordance with Algonquin’s E&SCP.

## **Cleanup and Restoration**

Final cleanup (including final grading) and installation of permanent erosion control measures would be completed within 20 days after the trench is backfilled, weather and soil conditions permitting. In conjunction with backfilling operations, any woody material and construction debris would be removed from the right-of-way. The right-of-way would be fine-graded to prepare for restoration. Permanent slope breakers or diversion berms would be constructed and maintained in accordance with Algonquin's E&SCP. Fences, sidewalks, driveways, stone walls, and other structures would be restored or repaired as necessary.

Revegetation would be completed in accordance with state and municipal requirements (where applicable) and written recommendations on seeding mixes, rates, and dates obtained from the local soil conservation authority or other duly authorized agency and in accordance with Algonquin's E&SCP. The right-of-way would be seeded within 6 working days following final grading, weather and soil conditions permitting. Alternative seed mixes specifically requested by the landowner or required by agencies may be used. Any soil disturbance that occurs outside the permanent seeding season or any bare soil left unstabilized by vegetation would be mulched in accordance with Algonquin's E&SCP.

### **2.3.1.2 Special Construction Procedures**

In addition to the standard pipeline construction methods described above, Algonquin would implement special construction procedures due to site-specific conditions and to reduce overall Project impacts.

#### **Same Ditch Replacement Construction Method**

About 26.3 miles of the Project would involve replacing existing pipeline with a larger diameter pipeline within the same ditch as the existing pipeline. This involves excavating a trench to remove the existing pipe; followed by the removal of the pipe. The removed pipe would then be transported away from the construction work area and properly disposed. Once the existing pipe is removed, the trench would be re-excavated wider and deeper (as appropriate) to accommodate the new, larger diameter pipeline, and the replacement pipe would be installed at approximately the same location as the existing pipe using standard construction methods (see section 2.3.1.1). Where the existing pipeline crosses major roadways and is cased, and the crossing method is bore or HDD, the carrier pipe would be removed and the casing pipe would be abandoned in place by capping and filling with appropriate material. Where casing pipe is not present, the carrier pipe would be abandoned in place. In these instances, the new pipeline would be installed with a 10-foot offset from the abandoned pipe or directly under the existing pipe, depending on the locations and depths of existing foreign utilities in the roadway. Where the pipeline to be removed or abandoned is in the proposed construction right-of-way for the new pipeline, the defined construction right-of-way would not be exceeded during removal.

#### **Abandonment Construction Method**

For the sections of pipe that would be abandoned at the Route 9 and Interstate 84 crossings, the pipe would first be inspected for free flowing liquids and if present all free flowing liquids would be removed and disposed of in accordance with all federal and state requirements. Wipe samples would then be taken at each end of the 0.2-mile-long segment at Route 9 and the 0.7-mile-long segment at Interstate 84 to check for residual polychlorinated biphenyls (PCBs) (see section 4.8.6.2). Each end would then be capped using a steel plate with a threaded fitting. The pipe would then be filled with

cement grout and each end would be permanently closed using threaded plugs. Considering the 26-inch-diameter mainline would be in the same right-of-way as the existing 30-inch-diameter pipeline, Algonquin would continue to maintain the right-of-way.

### **Road and Railroad Crossing Construction Methods**

The AIM Project would require 100 public road crossings and 5 railroad crossings. These roads and railroads are listed in table F-1 in appendix F. Constructing the AIM Project across public and private roadways and railroads, using either conventional open cut or road bore methods, would be based on site conditions and road opening permit requirements. Roadway opening permits would be obtained from applicable state and local agencies. Permit conditions would ultimately dictate the day-to-day construction activities at road crossings.

Construction would be scheduled for work within roadways and specific crossings so as to minimize impacts on commuter traffic. Appropriate traffic management and signage would be set up and necessary safety measures would be developed in compliance with applicable permits for work in the public roadway. Arrangements would be made with local officials to have traffic safety personnel or qualified and trained flaggers on hand during periods of construction. Provisions would be made for detours or otherwise to permit traffic flow if needed.

Crossings of private roadways would be coordinated with landowners to minimize access impacts. In those areas where the excavation of a longer length of trench would not pose a safety problem, the pipeline would be installed using the standard open trench method. Open trenches would either be backfilled or covered with steel plates during all non-working hours. Steel plates would be kept on site at each crossing so that a temporary crossing could be made across the trench as required (e.g., emergency vehicles).

Roadway crossing construction would occur using one of the methods described below.

#### **Open-cut Crossing**

This method is used on driveways, parking lots, and roads with low traffic densities where pipeline installation activities would not adversely impact the general public. The first step is to install the proper traffic control devices. Traffic would be detoured around the open trench during the installation process. The pipeline crossing would be installed one lane at a time. As the pipe is installed, successive lanes are alternately taken out of service for pipe installation until the crossing is completed.

Another option is to detour traffic around the work area through the use of adjacent roadways. If the roadway surface is paved, pavement over the proposed trench is cut, removed, and properly disposed. The trench would be excavated using a combination of a backhoe and hand shoveling around existing utilities once the ditch is completed and the pipe is installed (welded, inspected, and coated). All existing utilities exposed during excavation would be supported at their existing elevation to avoid damage. Support would be maintained until backfill of the pipeline ditch and the exposed utility are completed. The trench is then backfilled. A 15:1 sand to concrete mix called flowable fill, or Controlled Density Fill, may be used as backfill material to 1 foot over the pipeline. The additional backfill must be compacted to reduce stresses on the pipeline and to ensure the roadway supports the traffic load without settling. The existing trench subsoil may be used in the backfill if it can be compacted and is authorized by the permitting agency. In those cases where existing trench material is not used, backfill material would be obtained from an outside source and hauled in. The material used and methods of placement would comply with the requirements of the permitting agency.

Once the ditch line is backfilled, the contractor would install and maintain a temporary patch in the excavated areas. Final paving of existing roadways would be completed in accordance with applicable state and municipal requirements. With appropriate approvals, final paving may be accomplished the year following pipeline construction to allow for potential settlement of the ditch line in the road surface. Roadway markings and striping would be added as necessary. As required by PHMSA, pipeline markers would be placed adjacent to local roadways and decals would be placed on paved areas identifying the presence of a pipeline below the surface of the pavement.

### Bore Crossing

On roads with higher traffic densities and for railroads where service must be maintained, the pipeline may be installed by boring a hole under the road or railway. The soil and/or rock are bored by a drill that contains a cutting head which cuts through the soil. Dummy casing, which is slightly larger in diameter than the pipeline, may be installed immediately behind the cutting head. An auger is placed inside the pipe to remove the cuttings. Once the bore is completed, the pipeline section is welded to the boring pipe and pulled into place as the boring pipe is removed. Any voids between the pipeline and the subsoil are filled with grout (a sand-cement mix) to prevent settlement of the roadway surface or railroad track. This method allows the road or railroad to remain in service while the installation process takes place and minimizes the potential for trench settlement.

### Cased Crossing

The procedure for a cased crossing is similar to a bored crossing with one exception. A section of steel casing pipe, which is several inches in diameter greater than the pipeline, is bored into place. Casing sections are welded together to ensure the casing length is sufficient to cross the entire roadway. Once the casing pipe has been installed, the pipeline is pulled through the casing. To prevent potential corrosion of the pipeline due to contact between the pipeline and the casing, the pipeline is insulated from the casing pipe; usually the pipeline is coated with a layer of concrete. To prevent water from entering the casing, the ends of the casing are sealed with rubber or polyethylene seals. The space between the casing and the pipeline is vented to the atmosphere through the use of sections of small diameter pipe (vent pipe), which are welded to the casing ends and run from the casing to several feet above the surface of the ground. Casing pipe would be installed when required by permit or when there is a likelihood of encountering rock during the boring. Generally, crossings of major federal and state highways and certain railroads are installed using casings.

### Hammer Technique

In addition to the boring techniques described above, one additional technique consists of driving casing pipe that is slightly larger in diameter than the proposed pipeline under the roadway with a horizontal air-operated reciprocating hammer. The casing pipe is placed against the end of the trench near the edge of the roadway and driven under the paved road. Once in place, the material inside the casing is augured out and the pipe is installed through the casing. The casing pipe is then removed while grout is placed around the pipeline.

### **In-street Construction Methods**

In addition to road crossings, portions of the West Roxbury Lateral would be constructed within or along existing roadways. Algonquin would need to obtain road opening permits from the City of Boston and the Town of Dedham before conducting work in these roadways. For in-street construction, traffic control devices would first be installed. Traffic would be detoured around the construction area during the installation process. The working area along any street would be limited to areas designated in

applicable road opening permits. All in-street construction activities would be limited to this section, and this work area would move along the street as construction advances. Pavement over the proposed trench is cut, removed, and properly disposed. The trench is excavated using a backhoe and the pipe is installed (welded, radiographed, and coated). Excavation of the trench would proceed ahead of pipe installation to provide the contractor information regarding the existing utilities that would have to be crossed and to make vertical or horizontal adjustments in the alignment of the pipeline. The trench is then backfilled.

No trench would be left unprotected overnight because the trench would be backfilled or plated to ensure public safety. A 15:1 sand to concrete mix called flowable fill, or Controlled Density Fill, may be used. The backfill must be compacted to reduce stresses on the pipeline and to ensure the roadway supports the traffic load without settling. The existing trench subsoil may be used in the backfill if it can be compacted and is authorized by the permitting agency. In most cases, backfill material would be obtained from an outside source and hauled in. The material used and methods of placement would comply with the requirements of the permitting agency. Any excess spoils from the trench would be transported to a designated staging area(s) or workspace along the route where it would be temporarily stockpiled on an impervious surface and kept covered while soil management options are assessed. Stockpiled soil would be sampled and evaluated to determine the proper receiving facility for the material. The material would be transported to the receiving facility with proper documentation in accordance with federal and state regulations.

As with road crossings, once the ditch line is backfilled, the contractor would install and maintain a temporary patch in the excavated areas. Final paving of existing roadways would be completed in accordance with applicable state and municipal requirements. With appropriate approvals, final paving may be accomplished the year following pipeline construction to allow for potential settlement of the ditch line in the road surface. Algonquin would repave from curb-to-curb the Town of Dedham's roadways affected by the pipeline. Roadway markings and striping would be added as necessary. As required by PHMSA, pipeline markers would be placed adjacent to local roadways and decals would be placed on paved areas identifying the presence of a pipeline below the surface of the pavement.

Algonquin has developed acceptable traffic management plans for the New York and Massachusetts portions of the AIM Project. These plans are provided in appendix G and discussed in more detail in section 4.9.5.

### **Drag-Section and Stove-Pipe Specialized Construction Methods**

Construction in commercial/industrial areas and high-density urban areas would be accomplished by conventional construction methods, or by implementing specialized construction methods such as the drag-section or stove-pipe methods. These specialized methods are used to reduce the amount of workspace and duration of construction activity in the immediate vicinity of commercial and other high-density urban areas. The pipeline trench would be excavated as the pipeline section is fabricated, inspected, and made ready for installation.

For the drag-section method, several sections of pipe are prefabricated, the trench is dug to accommodate only the distance that can be installed and backfilled, the prefabricated pipeline segments (or drag sections) are placed into the trench and backfilled. For the stove-pipe method, one short section of trench is dug, a section of pipe is laid in the trench and welded into place, and that section of the trench is backfilled. Both specialized construction methods minimize the amount of land required for construction and the time the trench is left open.

## **Residential Areas**

Residential properties and other structures within 50 feet of construction work areas are identified in table H-1 in appendix H. Algonquin would undertake efforts in residential areas to minimize neighborhood and traffic disruption and to control noise and dust to the extent practicable.

The following measures would be taken on residential properties:

- notify local residents via U.S. mail 7 to 14 days in advance of construction activities;
- fence the boundary to the construction work area to ensure construction equipment, materials, and spoil remain in the construction right-of-way;
- preserve all mature trees and landscaping where practical;
- ensure piping is welded and installed as quickly as reasonably possible;
- backfill the trench as soon as the pipe is laid or temporarily steel plate the trench; and
- complete final cleanup (including final grading) and installation of permanent erosion control measures within 10 days after the trench is backfilled, weather conditions permitting.

For residences within 50 feet of the construction workspace, Algonquin has developed individual Residential Construction Plans noting special construction techniques and mitigation measures. These plans show the typical construction area to be disturbed and safety measures that would be implemented, such as construction fencing, access provisions, and use of steel plates. We reviewed the Residential Construction Plans, found them to be acceptable, and have determined that Algonquin's adherence to the requirements in the plans and our additional recommendations would reduce the potential impacts of construction on nearby residences. These plans are provided in appendix H. Additional analysis of the impacts on residential areas and residences is provided in section 4.8.3.

## **Rugged Topography**

Both temporary and permanent erosion controls would be necessary to adequately minimize erosion and sedimentation during construction activities in steep and rugged terrain. Temporary slope breakers are intended to reduce the runoff velocity and divert water off of the right-of-way. Temporary trench breakers may be used in conjunction with the temporary slope breakers to adequately channel the surface flow off of the right-of-way. In terrain with slopes too steep to safely and adequately construct the temporary slope breakers and temporary trench plugs, they may be placed where practicable, at the discretion of the Environmental Inspector (EI). Section 2.5 further describes the role and responsibilities of the EI.

Permanent trench breakers consisting of sandbags, gravel, cement, or cement-filled sacks would be installed when the trench is backfilled in ditches over and around the pipe in areas of slope with erosion potential. Temporary trench plugs, usually composed of compacted earth or other suitable low-permeable material, would be used to isolate waterbodies and wet areas to minimize channeling of groundwater along the ditch line during construction.

The following special construction techniques would be used during construction along side slopes. During grading, the upslope side of the pipeline right-of-way would be cut. The material removed from the cut would be used to fill the downslope edge of the right-of-way in order to provide a safe and level surface from which to operate the heavy equipment. Side hills may require ATWS downslope in order to accommodate the fill material. During grade restoration, the spoil would be placed back in the cut and compacted. Any springs or seeps found in the cut would be carried downslope through polyvinyl chloride pipe and/or gravel French drains installed as part of the cut restoration.

Permanent slope breakers would be constructed in coordination with the placement of the trench breakers in accordance with Algonquin's E&SCP. During restoration, seed would be applied at an increased application rate to increase the probability of establishment and rapid stabilization. In rugged terrain, additional types of temporary erosion controls such as super silt fence, erosion control matting, and hydro-mulching may be used during construction and restoration activities.

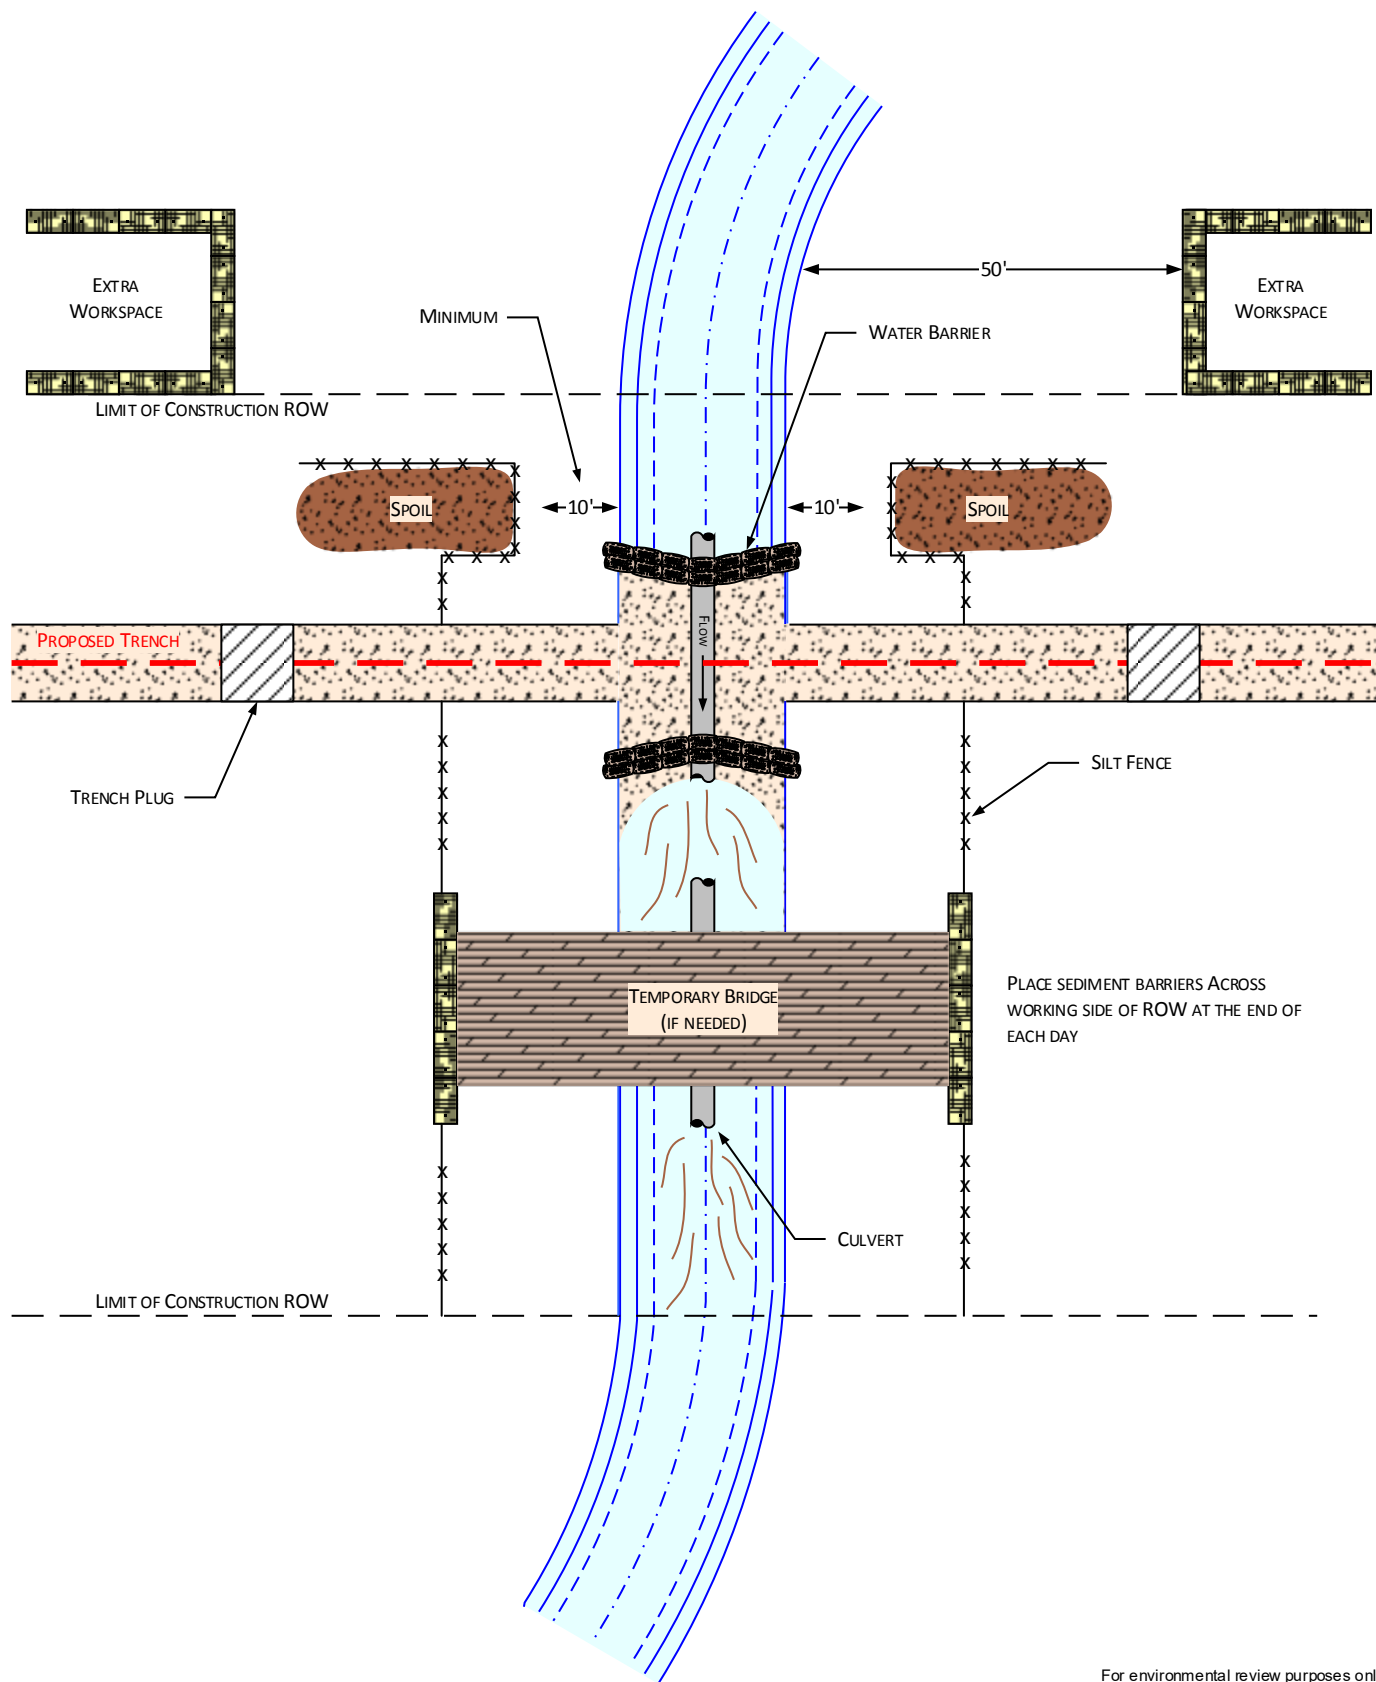

### **Active Agricultural Land**

Topsoil would be segregated in agriculturally cultivated or rotated croplands, pastures, and hayfields. In these areas, topsoil would be stripped and placed separate from subsoil when excavating the trench. Excess rock would be removed from at least the top 12 inches of soil to the extent practical. The size, density, and distribution of rock left in construction work areas should be similar to adjacent areas not disturbed by construction, unless otherwise approved in writing by the landowner. ATWS may be required when topsoil segregation is required. After the pipe has been lowered into the ditch, subsoil is used for backfilling and topsoil is then spread across the graded right-of-way. Equipment traffic would be controlled within agricultural land to minimize rutting or compaction. Soil compaction would be treated, as necessary, in conjunction with the Algonquin's E&SCP. See section 4.8.1 for additional discussion on agricultural land.

### **Waterbody Construction Methods**

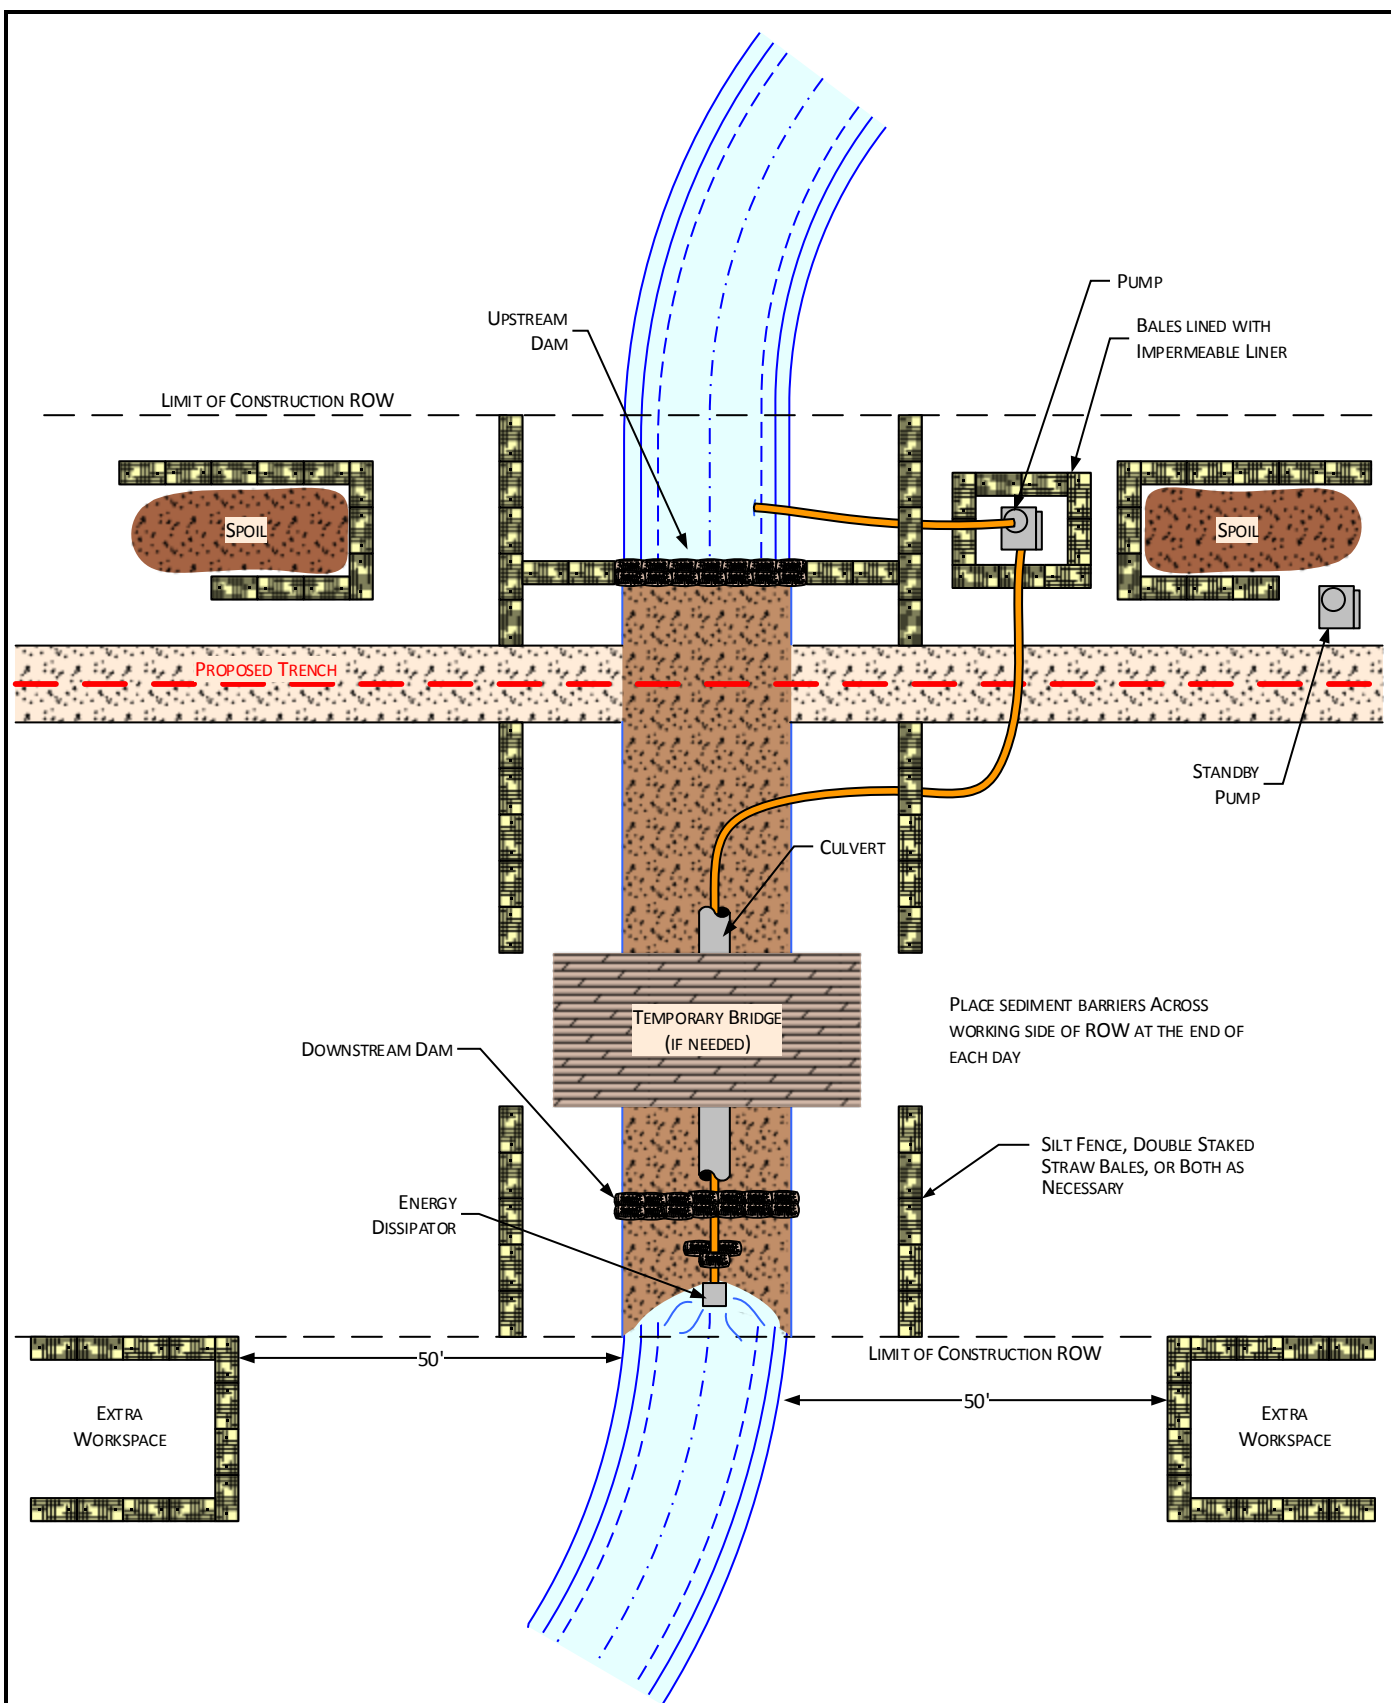

Construction of the AIM Project would cross 39 waterbodies in New York, 62 in Connecticut, and 1 in Massachusetts (see table I-1 in appendix I). The waterbody crossings would be constructed in accordance with the methods and timing restrictions described in Algonquin's E&SCP and state and federal permit requirements. To minimize potential impacts, waterbodies, streams, and rivers would be crossed as quickly and as safely as possible. Adherence to the construction procedures would ensure stream flow would be maintained throughout construction. Flowing waterbodies would be crossed by the pipeline facilities using conventional backhoe type equipment and dry crossing techniques to isolate the work area.

Unless dry at the time of crossing, minor streams (those less than 10 feet wide) would be crossed using a dry crossing method. The dry crossing method would involve installation of a flume pipe(s) and/or dam and pump before trenching to divert the stream flow over the construction area and allow trenching of the stream crossing in drier conditions isolated from the stream flow (see figures 2.3.1-2 and 2.3.1-3). Spoil removed during the trenching would be stored away from the water's edge and protected by sediment containment structures. Pipe strings would be fabricated on one bank and either pulled across the stream bottom to the opposite bank or carried into place and lowered into the trench. Where these methods are employed, ATWS areas would be required for assembly of the pipe strings and spoil storage areas.

For environmental review purposes only

**Figure 2.3.1-2**  
**AIM Project**  
 Typical Flume Method  
 Waterbody Crossing

For environmental review purposes only.

**Figure 2.3.1-3**  
**AIM Project**  
 Typical Dam and Pump Method  
 Waterbody Crossing

The open-cut crossing method would involve excavation of the pipeline trench across the waterbody, installation of the pipeline, and backfilling of the trench with no effort to isolate flow from construction activities. This method would only be used at stream crossings where there is no perceptible water flow at the time of construction. Use of the open-cut crossing method on any waterbodies would be confirmed during the federal and state permitting processes. Excavation and backfilling of the trench would be accomplished using backhoes or other excavation equipment working from the banks of the waterbody. Trench spoil would be stored at least 10 feet from the banks (topographic conditions permitting). A section of pipe long enough to span the entire crossing would be fabricated on one bank and either pulled across the bottom to the opposite bank, floated across the stream, or carried into place and submerged into the trench. The trench would then be backfilled and the bottom of the watercourse and banks restored and stabilized. Sediment barriers, such as silt fencing, staked straw bales, or trench plugs would be installed to prevent spoil and sediment-laden water from entering the waterbody from adjacent upland areas.

Except where reasonable alternative access is available, temporary construction equipment crossings would be installed across all waterbodies to gain access along the right-of-way for construction operations. Equipment crossings would be installed after clearing to minimize streambed disturbance and downstream siltation. Only clearing equipment and equipment necessary for the installation of equipment bridges would cross waterbodies prior to bridge installation. Where culverts are used, devices would also be placed at the outlet to prevent scouring of the stream bottom. After such equipment crossings are established, construction equipment would not be permitted to drive through the waterbody for access, and the equipment crossings would be removed once access in the area is no longer needed. After clearing activities, construction equipment must cross waterbodies on bridges consisting of one of the following devices:

- clean rock fill and culverts;
- equipment pads, wooden mats, and/or culverts; or
- flexi-float or portable bridge.

To facilitate pipeline construction across waterbodies, ATWS may be needed adjacent to the waterbody to assemble and fabricate the length of pipe necessary to complete the crossing. This work area is in addition to the standard construction right-of-way and would be located at least 50 feet away from the stream banks in cleared areas. If topographic conditions do not permit a 50-foot setback, then these areas would be located at least 10 feet away from the water's edge. If setbacks would not be able to be maintained due to construction limitations, such as slope and road crossing requirements, Algonquin would request modifications to the FERC Procedures (see section 4.3.2.4).

Vegetation would not be cleared, except over the pipeline trench, in the area within 10 feet of the waterbody. The work area would be limited in size to the minimum area necessary to safely construct the waterbody crossing and accommodate any stockpile of excavated material from the trench and the prefabricated pipeline crossing section.

Proposed waterbody crossing methods for each waterbody crossed by the proposed pipeline segments are provided in section 4.3.2.3 and are described in more detail in Algonquin's E&SCP.

### **Horizontal Directional Drill**

Algonquin proposes to utilize the HDD method at two locations along the mainline replacement segments. The HDD method would be used to cross the Hudson River along the Stony Point to Yorktown Take-up and Relay segment in the Town of Stony Point and Town of Cortlandt, New York. The second HDD would be used to cross Interstate 84 and the Still River along the Southeast to MLV 19 Take-up and Relay segment in the City of Danbury, Connecticut.

The HDD method involves establishing land-based staging areas along both sides of the proposed crossing (see figure 2.3.1-4). The process commences with the boring of a pilot hole beneath the waterbody or road and then enlarging the hole with one or more passes of a reamer until the hole is the necessary diameter to facilitate the pull-back (installation) of the pipeline. Once the reaming passes are completed, a prefabricated pipe segment is then pulled through the hole to complete the crossing. As is discussed further in section 4.3.2.3, the Hudson River HDD would be completed in soft soils and the Interstate 84/Still River HDD would occur in rock. Algonquin anticipates utilizing the intersect method to complete the pilot hole for both HDDs. The intersect method involves drilling from both sides of the HDD and intersecting in the middle. This method is preferred as it is less time-consuming and the exact entry and exit locations can be predetermined by utilizing this method. This process also enables the drilling sequence to have an instant hydraulic connection once the intersect is complete providing for a cleaner pilot hole. Algonquin has prepared site-specific crossing plans for the Hudson River and Interstate 84/Still River HDD crossings. These plans are provided in appendix J and discussed in more detail in section 4.3.2.3.

While the HDD method is a proven technology, there are certain impacts that could occur as a result of the drilling such as the inadvertent release of drilling fluid, which is a non-hazardous fluid comprised primarily of water, inert solids, and bentonite, a naturally occurring clay mineral. Drilling fluids that are released typically contain a lower concentration of bentonite when they surface because the bentonite is filtered out as it passes through sandy soils.

Algonquin would implement preventive measures so that the HDDs are performed in a manner that prevents, to the extent reasonably practicable, an inadvertent release, such as monitoring the down-hole mud pressures and continually swabbing the hole to keep the annulus free of cuttings. Should an inadvertent release occur, Algonquin's contractor would stop the drilling process and secure the area with straw bales, silt fence, sand bags, or other means to stop the spread of the inadvertent release and secure a 50-foot perimeter. Typically, a pump is installed in the secured area and the bentonite/water mixture is pumped back to the mud rig. Algonquin would contain, control, and clean up any release of drilling fluid during the HDD operations. Should the release of drilling fluids occur in a waterbody, then Algonquin may utilize inert, non-toxic loss circulation materials such as mica, wood fibers, and other types of cellulous-like cotton dust to attempt to plug the fracture by pumping these products down hole through the drill string as part of the drilling fluid mixture. Impacts of a drilling mud release into a waterbody generally would be less than those associated with any drilling mud recovery operation and less than potential impacts associated with an open-cut crossing that would otherwise be required.

Should an inadvertent release occur, Algonquin would implement the following to minimize potential impacts:

- monitor mud pressures down-hole to ensure they do not get too high for the materials and depth of cover being penetrated;
- conduct frequent visual inspections of the drill path on the surface so that timely detection of a release can be achieved;
- stop the mud pumps once an inadvertent release has been detected so that the release does not spread and secure the perimeter with straw bales, silt fence, sand bags, or other means; and
- notify Algonquin's environmental monitors to ensure efforts are being undertaken to protect the waterbody and any associated wetlands.

For environmental review purposes only

**Figure 2.3.1-4**  
**AIM Project**  
Conceptual Horizontal Directional Drill  
Waterbody Crossing

Algonquin has developed a Best Drilling Practices, Monitoring, and Clean-up of Horizontal Directional Drilling Inadvertent Returns Plan (BDP Plan) for monitoring the HDD program for the AIM Project (see appendix J). We reviewed the BDP Plan, found it to be acceptable, and have determined that Algonquin's adherence to the requirements in the BDP Plan would reduce the potential impacts of the HDDs, including an inadvertent release of drilling fluid.

To date, Algonquin has not provided a contingency plan that incorporates another location or another construction methodology for each HDD crossing. Therefore, if an HDD in its proposed location proves unsuccessful, Algonquin would be required to identify a new location for the crossing or new methodology, and request approval for the new location or methodology with all applicable agencies (see section 4.3.2.3).

Algonquin evaluated the feasibility of crossing other waterbodies using the HDD method in lieu of the conventional dry crossing methods described above. Factors in HDD design include the availability of a straight and relatively low relief laydown area for the pullback pipe section; the availability of large work areas at the HDD entry and exit points; surrounding terrain; land use; and operation concerns. In addition, for the larger diameter pipeline segments (i.e., 42- and 36-inch), the minimum drill length is quite long (around 2,000 feet or more). Some of the other major limiting factors in the more densely populated areas of the Project included new temporary impacts on nearby residences, direct impacts on residential homes, and the need to acquire new easement rights for the permanent right-of-way for operation and maintenance of the pipeline. Based on information from Algonquin, our review of Project mapping, and information we obtained during visits to the Project area, we conclude that the use of the HDD method at all waterbody crossings would be either technically infeasible, impractical, or would not result in a clear environmental advantage to the proposed dry crossing methods.

### **Wetland Construction Methods**

Construction of the Project would result in 160 wetland crossings, including 76 in New York and 84 in Connecticut. In some cases the Project facilities would include multiple crossings of the same wetland. There would be no wetland impacts in Rhode Island or Massachusetts (see table K-1 in appendix K). Wetland crossings would be accomplished in accordance with Algonquin's E&SCP, which is consistent with the FERC Procedures, with one exception. In instances where wetlands are dry enough to support skids and pipe, Algonquin's E&SCP proposes to excavate the trench prior to the pipeline assembly. Otherwise, after the pipeline is assembled, equipment would not be able to access the area where trenching would occur nor would there be sufficient construction workspace to safely excavate the trench. See section 4.4.4 for additional discussion.

Construction methods would minimize the extent and time that construction equipment operates in wetland areas. When wetland soils are inundated or saturated to the surface, the pipeline trench would be excavated across the wetland by equipment supported on wooden swamp mats to minimize the disturbance to wetland soils. In wetlands that have firm substrates, and are unsaturated and not frozen, the top 12 inches of wetland soil over the trench line would be segregated. Trench spoil would be temporarily piled in a ridge along the pipeline trench. Gaps in the spoil pile would be left at appropriate intervals to provide for natural circulation or drainage of water. While the trench is excavated, where practicable, the pipeline would be assembled in a staging area located in an upland area. If dry conditions exist within the wetland, the pipe fabrication would occur in the wetland. For inundated or saturated wetland conditions, pipe strings would be fabricated on one bank and either pulled across the excavated trench in the wetland, floated across the wetland, or carried into place and submerged into the trench. After the pipeline is lowered into the trench, wide track bulldozers or backhoes supported on swamp mats would be used for backfill, grading, and final cleanup. This method would minimize the amount of equipment and travel in wetland areas. If conditions allow, such as low flow or unsaturated soils, normal

cross-country construction practices would be used in wetlands. A complete description of construction methods can be found in Algonquin's E&SCP. The E&SCP also includes measures to mitigate unavoidable construction-related impacts on wetlands (e.g., cutting vegetation above ground level, returning wetland contours and drainage patterns to preconstruction configurations, installing sediment barriers immediately after initial ground disturbance, segregating topsoil from the trenchline, using low ground weight equipment or operating equipment on mats, etc.). These construction methods and mitigation measures are part of the proposed action and included in the environmental analysis in section 4.4.

ATWS may be needed adjacent to specific wetlands to facilitate the pipeline crossing. The staging areas are in addition to the typical construction right-of-way and may be used for the assembly and fabrication of the pipe section that would cross the wetland area. These work areas would be located at least 50 feet away from the wetland edge, topographic and other site-specific conditions permitting. If topographic conditions do not permit a 50-foot setback, these areas would be located at least 10 feet away from the wetland. In some instances, the setbacks would not be able to be maintained due to construction limitations, such as slope and road crossing requirements. In those cases, Algonquin has requested modifications to the FERC Procedures. A list of ATWS within 50 feet of a wetland and its purpose is provided in section 4.4.4.

### **2.3.2 Aboveground Facility Construction Procedures**

The AIM Project aboveground facilities would be constructed in compliance with the same federal regulations and guidelines as the pipeline facilities, and in accordance with the specific requirements of applicable federal and state approvals. Construction activities associated with these facilities would include clearing, grading, installing concrete foundations, erecting metal buildings, and installing piping, metering facilities, and appurtenances. Initial work at the new M&R stations would focus on preparing the sites for equipment staging, fabrication, and construction. Following foundation work, station equipment and structures would be brought to the site and installed, using any necessary trailers or cranes for delivery and installation. Equipment testing and start-up activities would occur on a concurrent basis.

The construction and restoration methods and procedures in Algonquin's E&SCP would be followed, as applicable, for the aboveground facilities as well.

## **2.4 CONSTRUCTION SCHEDULE AND WORK FORCE**

Construction of the Project pipeline facilities, new M&R stations, and modifications to Algonquin's existing compressor stations and M&R stations would occur over a 1.5-year period to accommodate multiple work locations and the need for scheduled system outages for the numerous tie-ins along Algonquin's system. Construction would begin in the 1<sup>st</sup> Quarter of 2015 with a projected in-service date of November 2016. Table 2.4-1 provides a preliminary construction schedule by year and construction spread.

While the overall schedule for the AIM Project is about 1.5 years of construction, pipeline construction generally proceeds at rates ranging from several hundred feet to 1 mile per day. Due to the assembly-line method of construction, construction activities in any one area would last from several weeks to several months on an intermittent basis.

TABLE 2.4-1

<sup>a</sup> This number reflects the total anticipated peak construction workforce of craft workers. Algonquin will also add three full-time permanent operational workers, which are not shown in this table. <sup>b</sup> At least seven EIs would be employed (A through G). Identifies the facilities under each of the EI's responsibility. <sup>c</sup> Certain complex pipeline crossings (e.g., road, streams, railroads) may be constructed during the April to October 2015 construction season. Winter clearing in November 2015 to February 2016 may be necessary to address time of year restrictions. <sup>d</sup> Civil site work at these two compressor stations will be completed in the April to October 2015 time frame. NA = Not applicable						

## 2.5 ENVIRONMENTAL TRAINING AND INSPECTION FOR CONSTRUCTION

In preparing construction drawings and specifications for the Project, Algonquin would incorporate all mitigation measures identified in its permit applications, as well as additional requirements of federal, state, and local agencies. Algonquin would provide the construction contractors with copies of applicable environmental permits as well as copies of “approved for construction” environmental construction alignment sheets and construction drawings and specifications.

Consistent with the FERC guidelines, Algonquin would conduct environmental training for its construction personnel, including EIs, contractors, and their employees, regarding proper field implementation of its E&SCP, SPCC Plan, and other project-specific plans and mitigation measures. The training would be given before the start of construction and throughout the construction process, as needed. The EIs and all other construction personnel are expected to play an important role in maintaining strict compliance with all permit conditions to protect the environment during construction.

As outlined in Algonquin’s E&SCP, full time EIs would be designated by Algonquin during active construction or restoration. Table 2.4-1 indicates the number of EIs proposed by year and

construction spread as well as the facilities under each EIs responsibility. The EIs would have peer status with all other activity inspectors and would report directly to the Resident Engineer/Chief Inspector who has overall authority on the construction spread. The EIs would have the authority to stop activities that violate the environmental conditions of the FERC certificate (if applicable), other federal and state permits, or landowner requirements, and to order corrective action.

Although Algonquin has stated that sufficient qualified EIs would be available to implement their environmental inspection program, it has agreed to participate in a third-party Environmental Compliance Monitoring Program for sensitive environmental areas of the AIM Project. Under this program, Algonquin would fund a contractor, to be selected and managed by the FERC staff, to provide environmental compliance monitoring services. The FERC Third-party Compliance Monitor would provide daily reports to the FERC staff on compliance issues and make recommendations to the FERC Project Manager on how to deal with compliance issues and construction changes, should they arise. FERC staff would also conduct periodic inspections. As discussed in section 4.0, use of a third-party Environmental Compliance Monitoring Program would be particularly appropriate along the Haverstraw to Stony Point Take-up and Relay, Stony Point to Yorktown Take-up and Relay, Southeast to MLV 19 Take-up and Relay, and West Roxbury Lateral segments and related aboveground facilities due to concerns about construction in residential and commercial areas, the Hudson River crossing, and potential blasting. Development of the program would occur prior to construction.

After construction, Algonquin would conduct follow-up inspections of all disturbed upland areas after the first and second growing seasons to determine the success of restoration and would monitor the success of wetland revegetation annually for the first 3 years (or as required by permits) after construction, or longer, until wetland revegetation is successful. To ensure the restoration of all areas affected by the Project, we would continue to conduct oversight inspection and monitoring following construction. If it is determined that any of the proposed monitoring timeframes are not adequate to assess the success of restoration, Algonquin would be required to extend its post-construction monitoring programs.

Additionally, as discussed further in section 4.12.1, PHMSA is mandated to provide pipeline safety under 49 USC 601. PHMSA administers the national regulatory program to ensure the safe transportation of natural gas and other hazardous materials by pipeline. PHMSA develops safety regulations and other approaches to risk management that ensure safety in the design, construction, testing, operation, maintenance, and emergency response of pipeline facilities. Many of the regulations are written as performance standards that set the level of safety to be attained and allow the pipeline operator to use various technologies to achieve safety.

## **2.6 OPERATION, MAINTENANCE, AND SAFETY CONTROLS**

Algonquin would operate and maintain the newly constructed pipeline facilities in the same manner as they currently operate and maintain their existing systems in compliance with PHMSA regulations provided in 49 CFR 192, the FERC guidance at 18 CFR 380.15, and the maintenance provisions in Algonquin's E&SCP. Algonquin would add three full-time permanent workers for operation of the proposed and modified facilities.

### **2.6.1 Pipeline Facilities**

The pipeline would be patrolled on a routine basis and personnel well qualified to perform both emergency and routine maintenance on interstate pipeline facilities would handle emergencies and maintenance related to:

- erosion and wash-outs along the right-of-way;
- settling, undermining, or degradation of repaired ditch line in streets or parking lots;

- performance of water control devices such as diversions;
- condition of banks at stream and river crossings;
- third-party activity along the pipeline right-of-way; and
- any other conditions that could threaten the integrity of the pipeline.

The applicable local operations supervisors would be notified of any conditions that need attention. Significant conditions would be reported to the pipeline owners. Corrective measures would be performed as needed.

The pipeline cathodic protection system would also be monitored and inspected periodically to ensure proper and adequate corrosion protection. The pipeline would be designed to allow the use of internal inspection technology. Algonquin would take appropriate responses to conditions observed during internal inspections as necessary.

The pipeline facilities would be clearly marked at line-of-sight intervals and at crossings of roads, railroads, and other key points. Markers would clearly indicate the presence of the pipeline and provide a telephone number where a company representative can be reached in the event of an emergency or prior to any excavation in the area of the pipeline by a third party. As part of its effort to prevent any third-party damage on the pipeline, Algonquin currently participates in the One Call system in all states where Algonquin has operational facilities.

During operation, the pipeline would be internally inspected and cleaned using “pigs” inserted and retrieved from the pipeline at aboveground pig launcher/receiver facilities. As a cleaning device, pigs can also be used to remove debris that accumulates in the pipeline. We received comments concerning the potential buildup of decay products within the pipeline and the risk of releasing these products to the environment during pipeline maintenance and pigging activities. Algonquin conducts annual inspections and regular cleaning of its operational pipelines. The pig receivers have a collection basin or trap that catches the liquids and solids that are removed from the pipe during the pig run. Any liquids or solids removed during these cleanings would be collected and treated as hazardous material that would be disposed of at a licensed facility in accordance with federal, state, and local regulations (see section 4.11.1.3).

## **2.6.2 Compressor Stations**

Algonquin would continue to operate and maintain the modified compressor stations in accordance with PHMSA requirements and standard procedures designed to ensure the integrity and safe operation of the facilities and to maintain firm natural gas transportation service. Standard operations at compressor stations include such activities as the calibration, maintenance, and inspection of equipment, as well as the monitoring of pressure, temperature, and vibration data, and traditional landscape maintenance such as mowing and the application of fertilizer. Standard operations also include the periodic checking of safety and emergency equipment and cathodic protection systems.

## **2.6.3 M&R Station Sites and other Aboveground Facilities**

Algonquin personnel would perform routine checks of the new and modified facilities, including calibration of equipment and instrumentation, inspection of critical components, and scheduled and preventative maintenance of equipment. Safety equipment, such as pressure-relief devices, would be tested for proper operation. Corrective actions would be taken for any identified problem.

### 3.0 ALTERNATIVES

---

As required by NEPA, FERC policy, and CWA 404(b)(1) Alternative Analysis, we evaluated alternatives to the Project to determine whether an alternative would be environmentally preferable and/or technically and economically feasible to the proposed action. We evaluated the no action alternative, energy alternatives, system alternatives, route alternatives and variations, and aboveground facility alternatives. We compared each alternative to the Project using three key criteria.

1. Does the alternative have the ability to meet the objectives of the proposed action?
2. Is the alternative technically and economically feasible and practical?
3. Does the alternative offer a significant environmental advantage over the Project?

With regard to the first criterion and for the purposes of NEPA, Algonquin's stated objectives for the Project are:

- provide an additional 342,000 Dth/d of additional natural gas supplies in southern New England and satisfy Algonquin's precedent agreements to deliver natural gas to the Project Shippers by November 2016<sup>1</sup>;
- eliminate capacity constraints on existing pipeline systems in New York State and southern New England; and
- provide access to growing natural gas supply areas in the Northeast region to increase competition and reduce volatility in natural gas pricing in southern New England.

It is important to note that not all conceivable alternatives are technically feasible or practical. Some alternatives may be incapable of being implemented due to limits on existing technologies, constraints of system capacities, or logistical considerations, while others may be impractical because sites are unavailable or cannot be developed for the proposed use. Additionally, it is necessary to recognize the environmental advantages and disadvantages of the proposed action in order to focus the analysis on reasonable alternatives with the potential to provide a significant environmental advantage over the Project. Some alternatives may reduce impacts on resources that are not relevant to the analysis or do not provide a significant environmental advantage over the proposed action. Other alternatives may reduce impacts on one resource but increase impacts on others.

Our analysis of each alternative as described in the subsections below is based on information provided by Algonquin and reviewed by FERC staff; our review of aerial photographs, U.S. Geological Survey (USGS) topographic maps, and other publicly available information; input from cooperating and other agencies; and our site visits, including a flyover of the Project area. Unless otherwise noted, we used the same desktop sources of information to standardize comparisons between the Project and each alternative. As a result, some of the information presented in this section relative to the Project may differ from information presented in section 4.0, which is based on Project-specific data derived from field surveys and engineered drawings.

Algonquin participated in our pre-filing process during the preliminary design stage for the Project (see section 1.4). This process emphasized identification of potential stakeholder issues, as well as identification and evaluation of alternatives that could avoid or minimize impacts. During this process,

---

<sup>1</sup> For the purposes of CWA permitting and section 404(b)(1) guidelines, the Project purpose has been defined as "expansion of the existing pipeline system from an interconnection at Ramapo, New York to deliver up to 342,000 Dth/d of natural gas transportation service to the Connecticut, Rhode Island, and Massachusetts markets."

Algonquin made several modifications to its proposed pipeline route to address stakeholder concerns. The majority of route changes were made to avoid conflicts with existing land uses or to increase the distance of the pipeline from residences and commercial business, recreation areas, or other infrastructure. These changes were subsequently made part of Algonquin's proposed route when it filed its FERC application, and are presented in this EIS. Route variations that were incorporated into the proposed route are identified in section 3.5.4.

Through the application of evaluation criteria and subsequent environmental comparisons, each alternative was considered until it was clear that the alternative was not reasonable or would result in greater environmental impacts that could not be readily mitigated. Those alternatives that appeared to be viable with less than or similar levels of environmental impact are reviewed in the text below.

### **3.1 NO-ACTION ALTERNATIVE**

The Commission has two courses of action in processing applications under section 7 of the NGA: 1) deny the requesting action (the no-action alternative), or 2) grant a Certificate, with or without conditions. Under the no-action alternative, the short- and long-term environmental impacts described in this EIS would not occur, but the objectives of the Project would not be met. The Project would create an additional 342,000 Dth/d of natural gas delivery from growing supply areas in the Northeast region to local distribution companies and municipal utilities (i.e., the Project Shippers) in southern New England. This would help meet existing and future demand for natural gas in the Project area, eliminate supply constraints on existing systems, and increase competition in regional energy markets. The Project additionally would provide new delivery points for local gas utilities in Connecticut and Massachusetts, which would provide natural gas in areas where it is needed and enhance the reliability of local distribution systems, particularly in Boston.

If Algonquin's proposed facilities are not constructed, the Project Shippers may need to obtain an equivalent supply of natural gas from new or existing pipeline systems. In response, Algonquin or another natural gas transmission company would likely develop a new project or projects to provide the volume of natural gas contracted through the Project's binding precedent agreements with the Project Shippers. Alternatively, customers of the Project Shippers could seek to use alternative fuel or renewable energy sources, which could require new facilities. In either case, construction of new pipelines or other energy infrastructure would result in environmental impacts that could be equal to or greater than those of the Project. For these reasons, the no-action alternative would not be preferable to or provide a significant environmental advantage over the Project.

### **3.2 ENERGY ALTERNATIVES**

#### **3.2.1 Energy Conservation**

Energy conservation measures, as encouraged or required by federal and state law, have and will likely continue to play an important role in reducing energy demand in the United States. At the federal level, for example, the Energy Policy Act of 2005 (EPAc) contained provisions for diversifying America's energy supply, reducing dependence on foreign sources of energy, increasing residential and business energy efficiency and conservation, improving vehicular energy efficiency, and modernizing domestic energy infrastructure. EPAc additionally directed the U.S. Secretary of Energy to conduct research and develop programs for energy efficient commercial applications (U.S. Congress, 2005).

Several laws enacted since EPAc have enhanced the federal role in energy conservation and efficiency. The U.S. Congress passed the Energy Independence and Security Act of 2007, for example, to increase the efficiency of products, buildings, and vehicles; protect consumers; and improve federal energy performance by establishing new incentive programs and expanding certain programs created

under EPA Act (U.S. Congress, 2007). According to the U.S. Department of Energy (DOE), key highlights of the Energy Independence and Security Act of 2007 include improved corporate fuel efficiency, a renewable fuels standard, and new energy efficiency standards for lighting and other appliances, such as lamps, dishwashers, dehumidifiers, and clothes washers (Congressional Research Service, 2007).

Two bills containing energy provisions were passed by the U.S. Congress between October 2008 and February 2009 in response to the economic downturn in the United States: the Energy Improvement and Extension Act and the American Recovery and Reinvestment Act of 2009. The Energy Improvement and Extension Act included provisions to extend tax credits for energy-efficient residential properties and appliances, bicycle commuting, and renewable and alternative fuels usage, to limit consumption and increase efficiency (U.S. Congress, 2008). The American Recovery and Reinvestment Act of 2009 provided more than \$16 billion for the DOE's Office of Energy Efficiency and Renewable Energy for the Weatherization Assistance Program, Energy Efficiency and Conservation Block Grants, Energy Efficient Appliance Rebate and ENERGY STAR® programs, and various alternative fuel programs for both transportation and energy production (U.S. Congress, 2009).

In addition to the federal programs, state-led initiatives have contributed to or encouraged energy conservation and efficiency in the Project area. One of the goals identified in the 2013 Connecticut Comprehensive Energy Strategy (CES), for example, is an expanded commitment to reducing energy consumption through "all cost-effective" energy efficiency programs (CTDEEP, 2013a). Other objectives promote new financing mechanisms for energy conservation and efficiency, performance-based rates of return for Connecticut utilities, and efficiency standards for new building construction or retrofits. The CES notes that a reduction in energy consumption through conservation and efficiency is one of the most cost-effective ways to lower Connecticut's contribution to air pollution.

Massachusetts, Rhode Island, and New York State similarly have implemented energy conservation plans which include efficiency initiatives. Each of the plans enumerates a series of policy objectives or actions designed to reduce energy consumption. The Massachusetts Clean Energy and Climate Plan for 2020, for example, promotes all cost-effective energy efficiencies, advanced building energy codes, and an expanded renewable portfolio standard for electricity (MAEOWEA, 2010). It also includes a Building Energy Rating and Labeling program designed to facilitate "apples-to-apples" comparisons of energy efficiency among and between buildings. Rhode Island's Comprehensive Energy, Conservation, and Affordability Act of 2006 requires local utilities to invest in all cost-effective energy efficiencies, prepare long- and short-term energy efficient procurement plans, and purchase least cost-supply and demand resources (Rhode Island General Assembly, 2006). The 2009 New York State Energy Plan encourages energy efficiency through a variety of policies and objectives, including the coordination of end-use efficiency programs, improved energy efficiency in public buildings, and improved training and compliance initiatives (New York State Energy Planning Board, 2009).

EPA Act and the other federal and state programs collectively promote increased energy efficiency and conservation by supporting new technologies and increasing funds for research and conservation. However, while these initiatives may minimize energy use, they are not expected to eliminate the increased demand for energy or natural gas in the Project area. The implementation and success of energy conservation and efficiency programs in curtailing energy use is a long-term goal requiring large-scale public education efforts, significant incentives, and government intervention extending well beyond the timeframe of the proposed Project. We also note that each of the states in the Project area recognizes energy conservation as one component of a larger portfolio of solutions, including increased use of natural gas, to provide clean, secure, reliable, and less expensive energy. Therefore, while energy conservation and efficiency would reduce demand for new energy supplies to some degree, we conclude it would not eliminate the need for additional natural gas supplies in southern New England.

### 3.2.2 Renewable Energy

Renewable energy sources, including wind, hydropower, biomass, solar, and tidal and wave energy, are another long-term fuel source alternative to natural gas that have the advantage over fossil fuels of reducing or eliminating the emissions, including GHG emissions, associated with the burning of natural gas and other fossil fuels. The DOE's Energy Information Administration (DOE/EIA) (2013) projects rapid growth in renewable fuel consumption due primarily to the implementation of a federal renewable fuels standard for transportation fuels and state renewable portfolio standard programs for electricity generation. Nationally, the share of U.S. electricity generation from renewable energy is projected to increase from 13 percent in 2011 to 16 percent in 2040, with wind, solar, and biomass accounting for most of the growth.

We received several comments on the draft EIS citing studies by researchers at Stanford University and the University of California at Davis that concluded that the world can meet all of its energy needs with renewables—chiefly wind, water, and solar power—as early as 2030 and, as a consequence, there is no need for natural gas. Authors Jacobson, Delucchi, and others have published papers that have identified a path for replacing fossil fuel-based energy with wind, water, and solar power. In a paper in 2011, Jacobson and Delucchi did not conclude that the world could run solely on renewables by 2030. Instead, this paper identified a path for replacing fossil fuel-based energy with wind, water, and solar power using a two-step process by the year 2050. Specifically, the authors indicate that the obstacles to achieving this worldwide energy transformation are primarily social and political, not technological, and further note that “[w]ith broad-based policies and social changes, it may be possible to convert 25 percent of the current energy system to [wind, water, and solar power] in 10–15 years and 85 percent in 20–30 years, and 100 percent by 2050.” A paper by Jacobson et al. (2013) concluded that all of New York State's energy infrastructure could be converted to renewable power by the year 2030. The study examined the technical and economic feasibility, and the public policies needed, to convert New York State's energy infrastructure in all sectors to one powered by wind, water, and sunlight by the year 2050. The authors expected that the fraction of new electric power generation from wind, water, and solar power would increase starting in 2013 such that all new electric generation would come from wind, water, and solar power sources by 2020. Existing conventional generation would be phased out gradually, but no later than 2050. Similarly, the authors expect that new heating and cooling technologies would be wind, water, and solar power-based by 2020, and existing heating and cooling technologies would be replaced over time, but no later than 2050. Jacobson et al. (2013) did not conclude that New York State could run solely on renewables by 2030. Implicit in the conclusions of the papers by Jacobson and others is a need to continue operating the existing mix of fossil fuel-based energy use through the year 2050.

An analysis of renewable energy sources as an alternative to the proposed Project, as well as our conclusions, is provided below.

#### Wind

Wind power is a proven technology that has experienced significant advances in recent years, including reduced installation costs, improved turbine performance, and reduced maintenance costs. Although wind projects have no emissions, such developments can affect wildlife, such as birds, as well as other resources. Additionally, many of the windiest sites in the Project region tend to be located along shorelines that are challenging to access, densely populated, and highly valued for other uses.

Current wind generation capacities in the Project area by state are 0 megawatts (MW) for Connecticut, 9 MW for Rhode Island, 103 MW for Massachusetts, and 1,638 MW for New York State (American Wind Energy Association, 2013). In southern New England, most of the existing wind farms are small operations that individually generate less than 15,000 kilowatts (kW) of power. In New York

State, there are several large operating wind farms in upstate areas, such as the Maple Ridge Wind Farm (320 MW) in Lewis County and Noble Clinton Windpark in Franklin County (NYSDEC, 2014g). In general, the major wind farms in New York are located in the northern and western portions of the state far from major downstate load areas.

Several new wind farm projects have been permitted or proposed in the Project area, particularly offshore. Cape Wind Associates, for example, plans to install 130 turbines off the coast of Cape Cod in Nantucket Sound. This project, which has been approved by federal and state regulatory agencies, will be capable of generating up to 468 MW of power. Financing of the project is expected to be completed in the second half of 2014. Construction of the project is expected to begin in 2015 and completed in 2016 (Cape Wind, 2014; Mohl, 2014).

Deepwater Wind proposes to construct two offshore facilities, the Block Island Wind Farm and the Deepwater Wind Energy Center, each of which would provide power to the Project area. The Block Island Wind Farm is a proposed 30 MW facility that would be built about 3 miles southeast of Block Island in Rhode Island state waters. The wind farm would connect to onshore electric transmission facilities in Narragansett, Rhode Island via a 21-mile submarine cable. Construction of the Block Island Wind Farm is planned to begin in 2015 (Deepwater Wind, 2014a).

Deepwater ONE, if approved and constructed, would be the first, 1,000 MW-scale offshore regional energy center to be built in the United States. In 2013, Deepwater Wind won an exclusive right from the U.S. Department of the Interior to develop wind facilities within a 256-square-mile area on the outer continental shelf in the Atlantic Ocean. As currently envisioned, the project would consist of 150 to 200 turbines to be built about 30 miles east of Montauk, New York between Block Island and Martha's Vineyard. The facility would connect to the Long Island Power Authority's existing transmission grid via a 98-mile subsea cable, which would make landfall on Long Island. Deepwater ONE would produce between 900 and 1,200 MW of power for sale in Long Island and southeastern New England. Construction of the project could begin as early as 2017 with operations beginning as early as 2018 (Deepwater Wind, 2014b; Marcacci, 2013).

Further south in New York State, the New York Power Authority, Long Island Power Authority, and Consolidated Edison are developing a proposal to build a wind farm about 13 miles offshore of the western end of the Rockaway Peninsula in the New York Bight. The Bureau of Ocean and Energy Management currently is evaluating a lease application from the project proponents for lands on the outer continental shelf, and may proceed with a competitive lease auction for these lands. If approved and constructed, the wind farm would generate 350 MW of electricity (with the potential to expand to 700 MW in later phases) for use in the New York City and Long Island markets (Bureau of Ocean and Energy Management, 2014; Long Island–New York City Wind Farm Project, 2014). Although this project has demonstrated continued interest, its development is still in its early stages and its future is uncertain. Additional site-specific engineering and environmental studies need to be completed, agencies need to release a request for proposal to select a private developer to build and operate the wind farm, the filing of permit applications needs to be made, and environmental reviews need to be conducted.

It is likely that wind projects will continue to be pursued in the Northeast region assuming continued financial incentives, state and public support, improvements in technology, and available transmission capacity for new electricity. In the long-term, wind energy may be able to replace some of the demand in the Project area for electricity generation from fossil-fuel sources. However, in the short-term, sufficient wind energy is not available in the Project vicinity that could provide the 342,000 Dth/d (100,205 MWh or 8,350 MW per 12-hour day) of energy that would be provided by the proposed Project. Increased wind energy would not meet the objectives of the Project, which would provide additional natural gas supplies to local distribution companies and municipal utilities for residential and commercial

uses, eliminate capacity constraints on existing natural gas transmission systems, and provide access to new natural gas supplies. The Project additionally would leverage existing delivery points on the Algonquin system and create new delivery points in southern New England at points where natural gas supplies are needed. In contrast, new wind facilities could require upgrades to or construction of new electric transmission facilities to transport power to market. It is unlikely that the environmental impacts associated with construction of these facilities would be significantly less than those of the Project.

For all the reasons discussed above, the use of wind energy would not meet the Project objectives or provide a significant environmental advantage over the Project.

## **Hydroelectric**

Hydroelectric generation is fully commercialized, including run-of-river and large impoundment facilities ranging in electricity generation capacity from less than one to hundreds of MWs. Hydroelectric generation in the Project area in 2012 was 4 gigawatt (GW) hours (GWh) in Rhode Island, 312 GWh in Connecticut, 912 GWh in Massachusetts, and 24,652 GWh in New York State (National Hydropower Association, 2014).

The DOE/EIA (2013) projects that hydropower will continue as a leading source of renewable electricity generation in the U.S. through 2040, but little new hydroelectric capacity is expected to be developed in this period. Nevertheless, several recent, small-scale hydroelectric projects have been licensed or proposed in southern New England and New York State. New England Hydropower Company, LLC, for example, has been granted five preliminary permits from the FERC to develop new, small-scale, renewable electricity generation facilities in Connecticut, Massachusetts, and Rhode Island. If all five projects are constructed, the peak capacities of the new facilities would range from 30 to 300 kW (New England Hydropower Company, LLC, 2013).

In addition to small-scale projects, there have been several recent proposals to construct high-voltage transmission lines to transport hydroelectric power produced in Canada to New England and New York State. The Northern Pass Transmission Line Project is a proposal to construct 153 miles of high voltage, direct current, 1,200 MW transmission line from the U.S./Canadian border to Franklin, New Hampshire. From there, about 34 miles of alternating current transmission line would be built to interconnect with existing grid facilities in Deerfield, New Hampshire. Northern Pass submitted an application to DOE in October 2010 and filed an amended application in June 2013 (Northern Pass Transmission, LLC, 2014).

The New England Clean Power Link Project is a recently announced proposal to construct about 150 miles of high voltage, direct current, 1,000 MW transmission line from the U.S./Canadian Border to a location in Ludlow, Vermont. The transmission line would interconnect with the Vermont Electric Power Company's existing transmission grid for delivery service in Vermont and throughout the New England market. TDI New England has applied for permit applications and construction is planned to begin in 2016, with a projected completion date of 2019 (TDI New England, 2014).

Several large-scale projects have been announced to transport hydroelectric power from Canada to New York State. These include the West Point Transmission and Champlain Hudson Power Express Projects. The West Point Transmission Project is a proposal to construct an 80-mile-long, 1,000 MW transmission line between Athens and Buchanan, New York. West Point Partners, LLC (WPP) is in the process of submitting federal and state permit applications and is expecting to file an amendment to its Article VII application in early 2015 (WPP, 2014). The Champlain Hudson Power Express Project is a proposal to construct over 330 miles of 1,000 MW subterranean transmission line from Quebec to Astoria, New York. Key permits have been obtained and construction is planned to begin in 2015 with an in service date of 2018 (Transmission Developers, Inc., 2014). The projects would service downstate

markets in New York State, but would not provide power to southern New England as currently proposed.

Hydroelectric power may be able to replace some of the demand in the Project area for new electricity generation. However, regulatory review of these new projects is ongoing and therefore, their future is uncertain. Also, as is the case with wind, hydroelectric power would not meet the objectives of the Project. For example, new or expanded hydroelectric facilities would not provide additional natural gas supplies to southern New England, provide access to new source areas, utilize existing infrastructure, or provide new delivery points where natural gas supplies are needed. We additionally note that new hydroelectric facilities would require upgrades to or construction of new transmission facilities to bring power to market. It is unlikely that the environmental impacts associated with construction of these transmission facilities would be significantly less than those of the Project. For all these reasons, the use of hydroelectric energy would not be practical or provide a significant environmental advantage over the Project.

### **Biomass**

Combustion of biomass (e.g., wood, crops, landfill gas, or solid wastes) is a proven technology using biomass feedstock. Each of the states in the Project area is a participant in the Regional Greenhouse Gas Initiative cap-and-trade emissions reduction program, and each incentivizes energy retailers to derive a certain amount of the energy they sell from biomass. Recent studies, however, have called into question previously held views of biomass as a “carbon-neutral” fuel source. As a result, in 2012, Massachusetts suspended consideration of applications for certain biomass generation units pending a rulemaking.

By state, current net electricity generation from biomass in the Project area is 22 GW in Rhode Island, 62 GW in Connecticut, 99 GW in Massachusetts, and 201 GW in New York State (DOE/EIA, 2014). A recently completed project in Dartmouth, Massachusetts includes a digester to convert food and other organic wastes into about 650 megawatt hours (MWh) per year (Commonwealth of Massachusetts, 2014). In addition, a proposed wood burning facility in Plainfield, Connecticut would convert clean wood waste from construction sites into 37.5 MWh of power per year (Enova Energy Group, 2014).

Biomass fuels used to generate electricity may be able to replace some of the demand in the Project area for new electricity generation, but this would not meet the objectives of the Project. Certain types of biomass fuels, such as landfill or digester waste gas, could potentially replace some of additional natural gas supply that would be provided by the Project. However, there currently is a lack of adequate infrastructure to convert biomass to power and transport the energy to market on a large scale. As a result, additional use of biomass fuels as a substitute for natural gas would require the construction of new facilities, including pipelines, which could result in impacts similar to or greater than those of the Project. For all these reasons, the use of biomass energy would not be practical or provide a significant environmental advantage over the Project.

### **Solar/Photovoltaic**

Solar or photovoltaic power systems convert sunlight directly into electricity. While each of the states in the Project area has implemented policies or incentives to encourage development of solar resources, solar energy represents a small fraction of energy production and consumption in the Northeast region. Net generation from solar sources is 10 GW combined for all of New England and 2 GW for New York State (DOE/EIA, 2014).

Several recent solar energy projects have been proposed or announced in the Project area. HelioSage Energy is planning to construct a 20 MW, alternating current, photovoltaic system on a 145-

acre site in Sprague and Lisbon Counties, Connecticut (HelioSage, 2014; Howard, 2013). Massachusetts Electric Construction Company (MECC) is in the process of constructing several ground-mounted solar arrays ranging in capacity from 1.5 to 5.9 MW at 12 sites in Connecticut and Massachusetts (MECC, 2014). RS Energy is planning to develop solar farms at four sites in Massachusetts with a combined generating capacity of 3.5 MW (AZoCleanTech.com; 2014). The HelioSage Energy and RS Energy projects are still in early development stages and their future is uncertain.

While solar initiatives could potentially bring additional energy to the Project area, solar energy is least available during winter months when demand for natural gas is highest. Additionally, the scale at which customers would choose to install solar panels based on existing or future incentives is unclear. These systems generally are not well suited for use as large-scale generation in the Northeast region due to relatively low direct insolation, lower efficiencies, and higher capital costs. Further, solar power generation on an industrial/commercial scale would require cooperation or agreements with the owners of existing infrastructure to use existing buildings or other structures for mounting the solar arrays, or large areas of land with impervious cover and no shading, which would need to be rededicated to permanent solar collection facilities, to allow for the photovoltaic panels to gather energy. In contrast, the permanent right-of-way of the proposed Project area would be restored to pre-construction contours and maintained as herbaceous cover. Therefore, a large, industrial/commercial scale, solar power generation facility would result in greater visual, vegetation, and habitat impacts than the proposed Project. Impacts of new electric transmission lines associated with solar power generation facilities would be similar to or greater than the impacts from the proposed Project because Algonquin would primarily use its existing right-of-way whereas a new electric transmission line would need to acquire and disturb new land.

Like other renewable energy fuels, solar power may be able to replace some of the demand in the Project area for new electricity generation. However, solar energy would not meet the objectives of the Project. Additionally, construction of commercial-scale solar facilities would require development of large sites and construction of new electric transmission facilities, which could result in impacts similar to or greater than those of the Project. For all these reasons, solar energy would not be practical or provide a significant environmental advantage over the Project.

### **Tidal and Wave**

Wave energy technology is in the early stages of development and not commercially available. Additionally, the high cost of construction and potential for environmental impacts on marine resources may limit development of this resource. In contrast, capture of tidal power is a proven technology, but criteria for suitable site selection limit the areas available for development. Suitable sites require large water flows through a narrow channel into a substantial tidal basin.

The Muskeget Tidal Energy Project in Edgartown, Massachusetts is an example of a recent tidal energy project in southern New England. The Town of Edgartown, in conjunction with nearby towns, universities, and government agencies, is developing a proposal to construct a 5 MW pilot project in the Muskeget Channel. The project would deploy new marine hydrokinetic technologies to produce electricity from incoming and outgoing tides in the channel (New England Marine Renewable Center, 2014).

Like the other renewable fuels, tidal and wave energy may be able to replace some of the demand in the Project area for new electricity generation. However, tidal and wave energy would not meet the objectives of Project. Additionally, it is unlikely that the environmental impacts associated with construction and operation of large-scale hydrokinetic facilities, including any electric transmission lines needed to bring the power to market, would be significantly less than those of the Project. This is due to the potential construction and operational impacts on the marine environment associated with a

permanent, large-scale hydrokinetic generating facility. For all these reasons, tidal and wave energy would not be preferable to or provide a significant environmental advantage over the Project.

### **Summary of Renewable Energies**

While the renewable energy projects that have been and will be proposed in the Project area will help diversify the electricity market and decrease the need for traditional fossil fuel energy sources, there still would be issues associated with the siting and development of renewable energy facilities. Other issues would include high costs and the time required to develop new energy infrastructure, including electricity generation and transmission facilities. Construction of new facilities would result in impacts on air, water, wildlife, and other resources, which could be similar to or greater than those for natural gas pipelines.

We also note that renewable energy is not 100 percent interchangeable with natural gas. Most renewable energy sources are used to generate electricity. While natural gas is used to generate electricity, it is also used for heating and cooking. These uses could be served by electricity instead of natural gas, but existing natural gas-based heating and cooking systems in the Project area would need to be converted to electric-based systems, which could be prohibitively expensive for many consumers. In contrast, the Project would provide additional natural gas supplies for direct residential and commercial uses, including heating and cooking. Therefore, renewable energy alternatives were eliminated from further consideration.

#### **3.2.2.1 Nuclear Energy**

Another traditional, non-renewable fuel source alternative to natural gas for electricity generation is nuclear power. There currently are four active nuclear power plants in New England and four in New York State, though one of these facilities, Vermont Yankee in Vernon, Vermont, is scheduled to close in 2014. By state, current net generation from nuclear facilities in the Project area are 0 GWh in Rhode Island, 1,565 GWh in Connecticut, 441 GWh in Massachusetts, and 3,765 GWh in New York State (DOE/EIA, 2014). No substantive increase in the use of nuclear power in New England or the Mid-Atlantic region is expected to occur between 2012 and 2040 based on projections by the DOE/EIA (2013).

Because the subject of nuclear power remains controversial, any future proposals to construct new or expand existing facilities in the region would likely involve prolonged regulatory review and public opposition. Furthermore, there is a regulatory process addressing safety and environmental issues (including reviews in the areas of nuclear safety and security, the disposal of spent nuclear fuel, and alterations to hydrological and biological systems) that would have to be completed before any new plants could be constructed and operated. Even if this regulatory review process was completed, a new plant would not likely be operational for many years. For these reasons, new sources of nuclear power could not meet the schedule of the Project and are not currently a practicable alternative to the proposed Project.

#### **3.2.2.2 Fossil Fuels**

Coal potentially could be used to provide additional electrical generation in the Project area, but this would not meet the objectives of or provide the same benefits as the Project. We also note that life-cycle greenhouse gas emissions for coal-fired electricity generation range from 36 to 47 percent higher than for natural gas-fired electricity (ICF International, 2012).

Additional use of oil by existing facilities, development of new oil-fired generating plants, or conversion of natural gas home heating systems to oil burning furnaces could provide additional electricity and heat during peak winter demand periods. However, an increase in the use of petroleum

and oil-fired energy or heat sources would produce greater quantities of sulfur dioxide (SO<sub>2</sub>), nitrogen oxides (NO<sub>x</sub>), GHGs, and airborne mercury than natural gas heating units and boilers (EPA, 1995). This would reduce regional air quality and would be in conflict with the state energy plans and the Policy Statement of the New England Governors, each of which identify natural gas as a key component of sustainable energy.

For all the reasons stated above, the use of other fossil fuels would not be practical or provide a significant environmental advantage over the Project.

### **3.3 SYSTEM ALTERNATIVES**

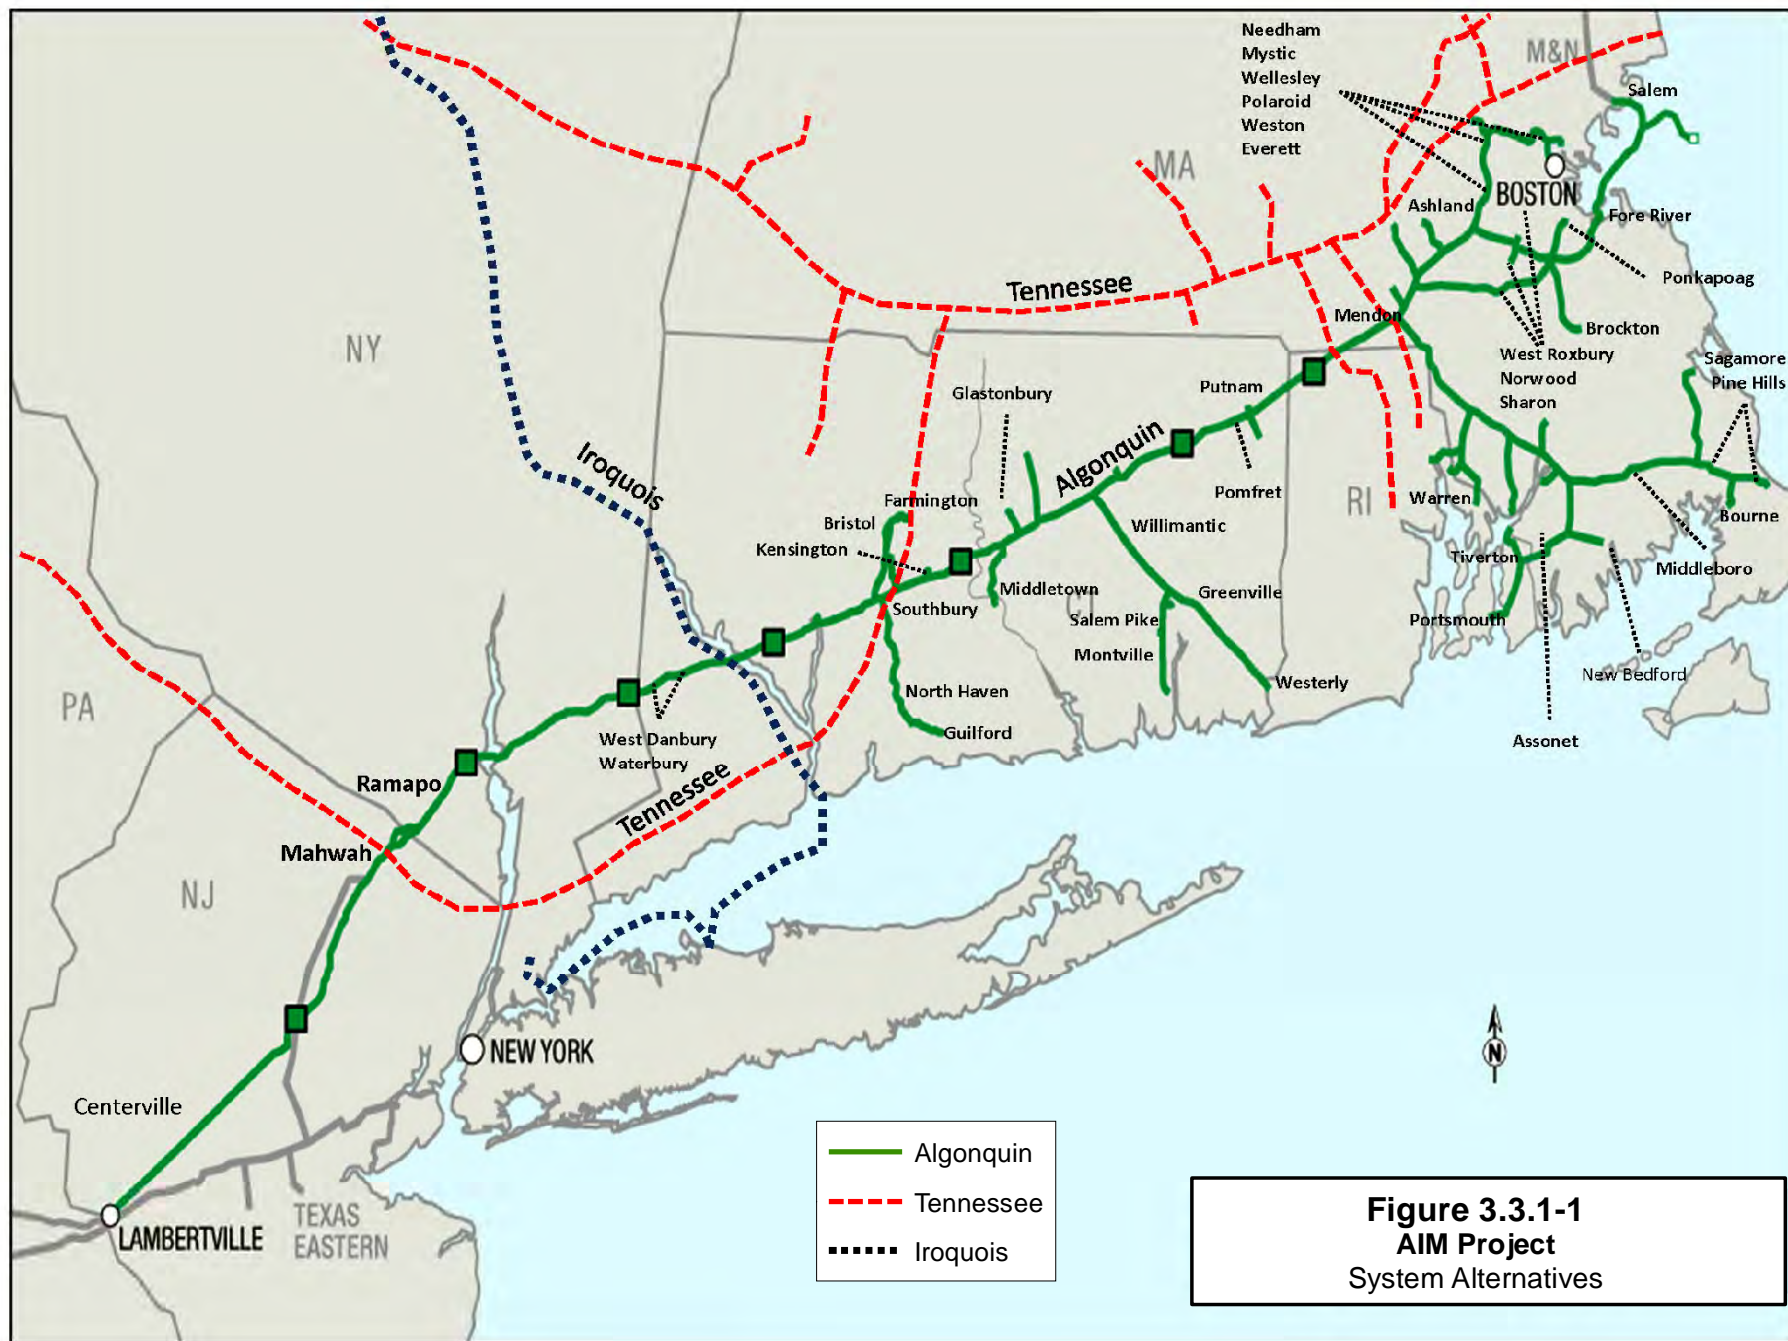

System alternatives would utilize existing, modified, or proposed natural gas pipeline systems to meet the objectives of the Project. Implementation of a system alternative would make it unnecessary to construct all or part of the Project, although modifications or additions to existing or proposed systems could be required. These modifications or additions would result in environmental impacts that could be less than, similar to, or greater than those associated with construction and operation of the Project. The purpose of identifying and evaluating system alternatives is to determine whether the environmental impacts associated with construction and operation of the Project could be avoided or reduced by using another pipeline system, while still meeting the objectives of the proposed action.

A viable system alternative to the Project would have to provide the pipeline capacity necessary to transport an additional 342,000 Dth/d of natural gas at the contracted volumes and to the delivery points required by the precedent agreements signed by Algonquin and the Project Shippers. A viable system alternative additionally would need to eliminate capacity constraints on existing pipeline systems in New York State and southern New England, and provide access to the growing supply areas in the Northeast region. A viable system alternative would need to provide these services within a timeframe reasonably similar to the Project.

Our analysis of system alternatives includes an examination of existing and proposed natural gas transportation systems that currently or eventually would serve the markets targeted by the Project, and considers whether those systems would meet the Project's objectives while providing an environmental advantage over the proposed action. A brief assessment of each of the existing and proposed systems is provided in the subsections below.

#### **3.3.1 Status of Existing Systems**

In addition to the existing Algonquin system, two other existing interstate pipelines provide natural gas transmission service into southern New England: Tennessee Gas Pipeline (Tennessee) and Iroquois Gas Transmission (Iroquois) (see figure 3.3.1-1). Like the Algonquin system, each of these pipelines currently are at or near capacity. Consequently, use of either of these systems would require modifications, including the construction of new pipelines, to transport the volume of gas to the delivery points required by the Project Shippers. Figure 3.3.1-1 depicts the location of the Tennessee and Iroquois systems relative to Algonquin's existing system in southern New England.

**Figure 3.3.1-1**  
**AIM Project**  
 System Alternatives

The existing Tennessee pipeline reaches western Connecticut, northern Rhode Island, and central Massachusetts. As currently configured, the system cannot service eastern Connecticut, southern Massachusetts, or southern Rhode Island. The existing Iroquois pipeline services southwestern Connecticut and Long Island, New York, but does not reach eastern Connecticut, Rhode Island, or Massachusetts. As a result, significant expansion of the Tennessee or Iroquois systems would be necessary to provide service to the delivery points required by the Project Shippers. Expansion of these systems would require construction of hundreds of miles of new pipeline, much of which would duplicate the existing Algonquin system, to reach the delivery points required by the Project Shippers. This would result in much greater environmental impact than the Project, which would use a combination of pipeline replacements, loops, and a lateral, as well as additional compression, to deliver the additional volume of natural gas required by the Project Shippers. Therefore, expansion of the Tennessee or Iroquois systems would not be a reasonable alternative to or provide an environmental advantage over the Project.

### **3.3.2 Proposed Systems**

We identified two planned projects in southern New England which, if modified, could provide additional volumes of natural gas to the Project Shippers in southern New England. These are Tennessee's Connecticut Expansion Project in New York, Massachusetts, and Connecticut, and Tennessee's Northeast Energy Direct Project in New York and Massachusetts.

#### **Connecticut Expansion Project**

As currently planned, the Connecticut Expansion Project would provide about 72,000 Dth/d of additional transportation capacity on the existing Tennessee system for delivery to customers in Connecticut. The project would require the construction of about 13 miles of pipeline loops at various points along Tennessee's existing Line 200 pipeline in New York, Massachusetts, and Connecticut (Dubay, 2013; Santa Maria, 2013; Hamilton, 2014). To meet the objectives of the Project, the Connecticut Expansion Project would need to be expanded to provide additional capacity and reach the delivery points required by the Project Shippers. This would require the construction of hundreds of miles of additional pipeline, much of which would duplicate the existing Algonquin system. The additional pipeline construction would result in much greater environmental impact than the proposed modifications to the Algonquin system. Therefore, the Connecticut Expansion Project would not be preferable to or provide a significant environmental advantage over the Project.

#### **Northeast Energy Direct Project**

The Northeast Energy Direct Project, as currently envisioned, would provide up to 2.2 billion cubic feet per day of natural gas to southern New England. The project would require the construction of about 344 miles of pipeline in Pennsylvania, New York, Connecticut, New Hampshire, and Massachusetts (Tennessee, 2014). To meet the objectives of the Project, the Northeast Energy Direct Project would need to be modified to reach the delivery points required by the AIM Project Shippers. This would require the construction of hundreds of miles of additional pipeline, much of which would duplicate the existing Algonquin system. The additional pipeline construction would result in greater environmental impact than the Project. Moreover, if the project is proposed before the Commission in the future and subsequently approved and constructed, the Northeast Energy Direct Project would be in-service no sooner than November 2018, so it would not meet the objectives of the Project within a reasonable timeframe. For all these reasons, the Northeast Energy Direct Project would not be preferable to or provide a significant environmental advantage over the Project.

### 3.4 FACILITY DESIGN AND SITING ALTERNATIVES

Algonquin states that its existing mainline system does not have adequate unsubscribed capacity to accommodate the additional volume of natural gas required by the Project Shippers. Algonquin's system has a capacity of 2.6 billion cubic feet per day (bcf/d) along its 1,127-mile length between Lambertville, New Jersey and the Boston area in Massachusetts. The new and modified facilities would create an additional 342,000 Dth/d of natural gas transportation capacity on Algonquin's system for delivery to the Project Shippers at various points in southern New England (see figure 3.4-1).

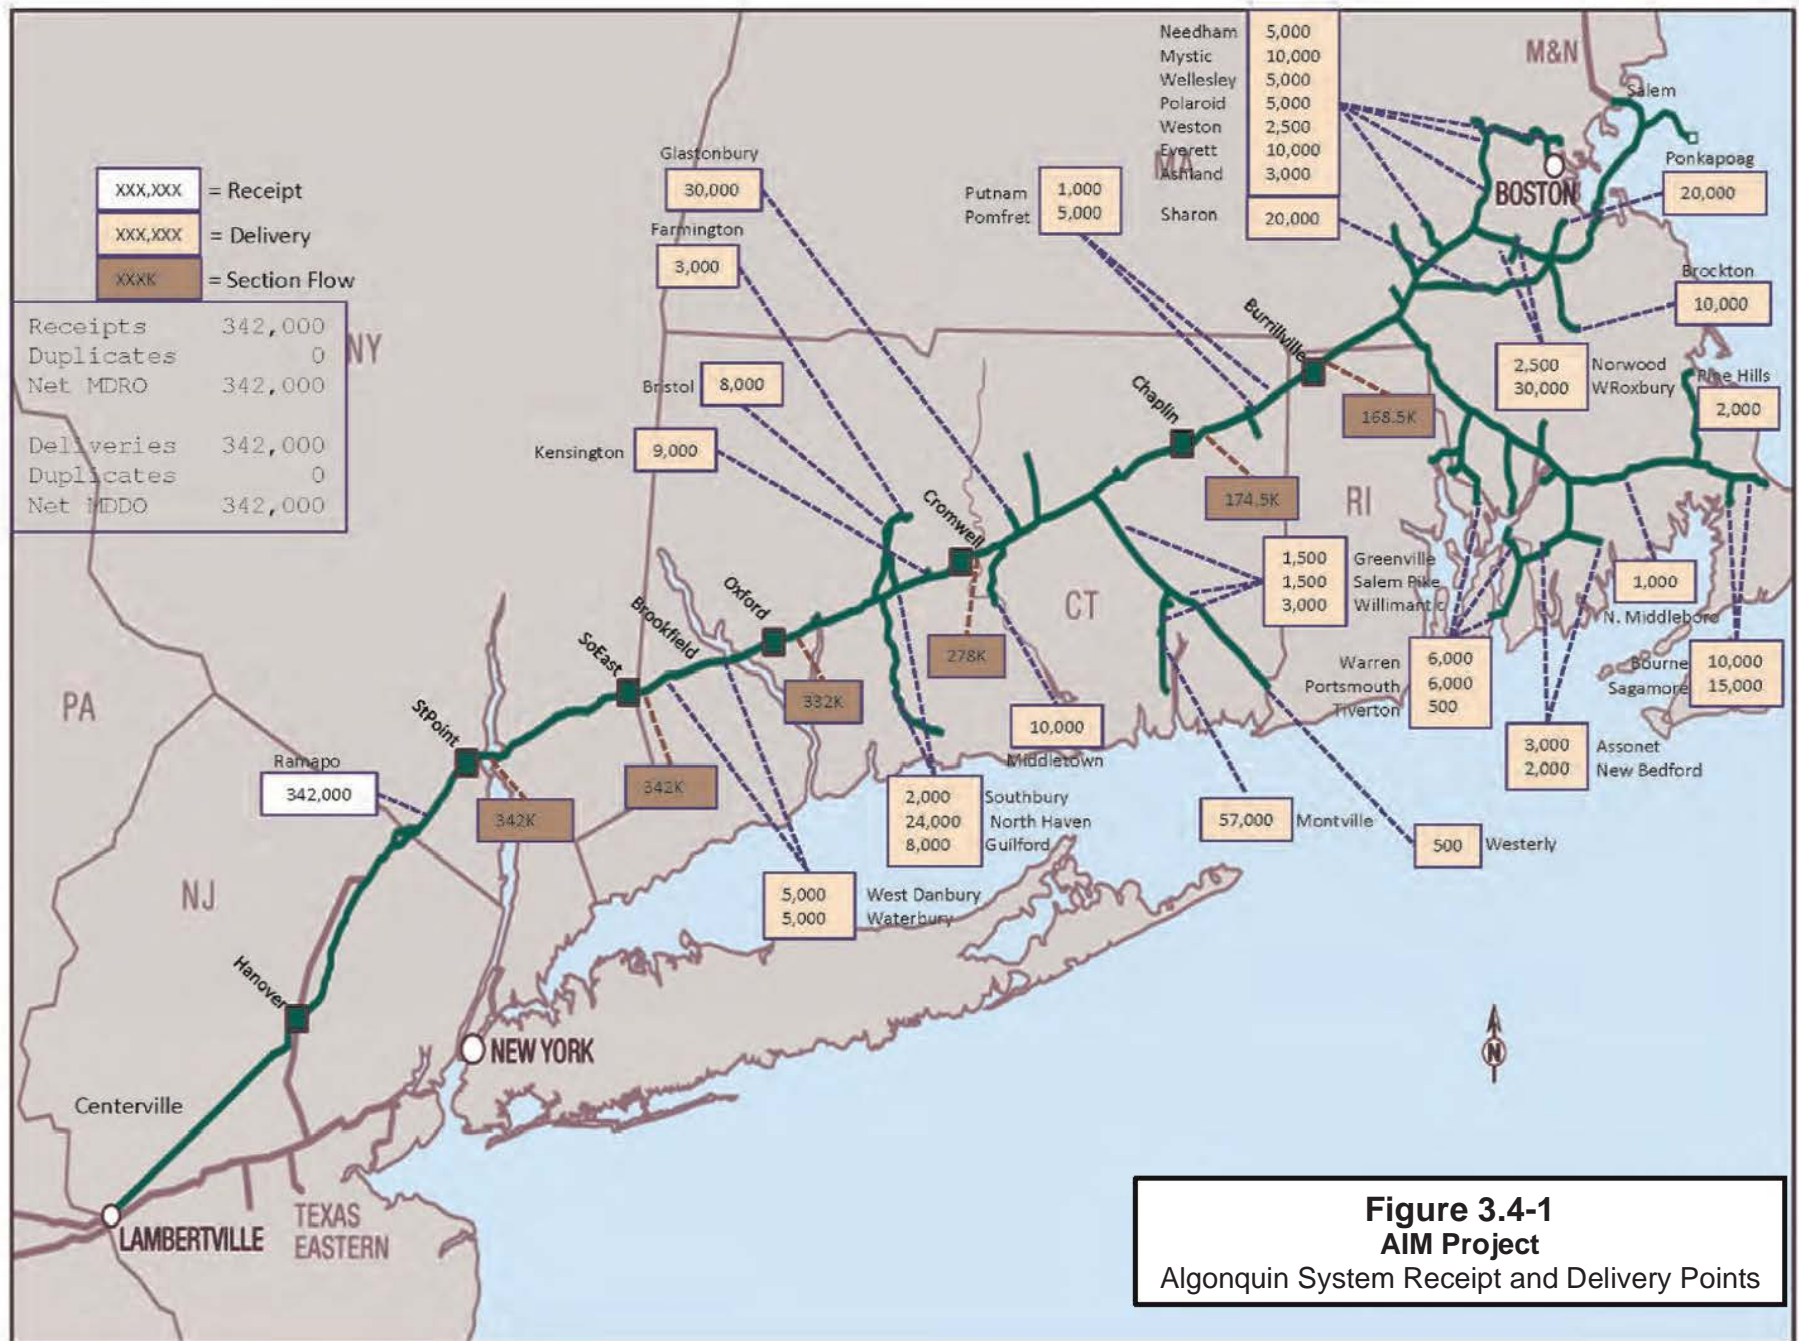

We received several comments from stakeholders regarding facility design and siting for the proposed replacement, loop, and lateral pipelines and other facilities for the Project. Algonquin's design for the proposed facilities is based on the flow dynamics and pressure of natural gas as it moves through the pipeline system. Natural gas is pressurized at compressor stations to create flow within the mainline and lateral pipelines within the system. As the gas exits a compressor station and moves along a pipeline, the pressure of the gas decreases due to turbulence and friction. The pressure continues to drop until the gas is re-compressed at the next compressor station along the system. In general, the pressure of gas in a pipeline must be equal to or greater than 450 psig where it enters a compressor station to ensure efficient operation of the system; the pressure is greater, up to the MAOP of the pipeline, where the gas leaves the compressor station.

Algonquin states that it designed and sited the proposed Project facilities to increase capacity and maintain the required pressure profiles along each pipeline segment between the existing compressor stations along the system. We independently verified Algonquin's mainline system expansion and the flow dynamics of its existing system. In some of the segments on Algonquin's mainline pipelines, the additional volume of natural gas required by the Project Shippers would be provided by increased compression without the need for a larger diameter pipeline or a new pipeline loop. For example, this is the case of the mainline segments at points downstream of the Chaplain Compressor Station in Windham County, Connecticut and the Burrillville Compressor Station in Providence County, Rhode Island. In these pipeline segments, the existing flow rates and pressures in the mainline pipelines are lower than at upstream segments due to customer deliveries of natural gas out of the system. As a result, these segments can accommodate additional volumes of natural gas with increased compression alone.

In other segments along the system, there is little or no capacity to transport additional volumes of natural gas because of higher flow rates and pressures within the pipelines. In these areas, a combination of new pipeline construction and increased compression would be necessary to create additional capacity to transport the volume of natural gas required by the Project Shippers. This is the case, for example, of the mainline segment between the existing Stony Point Compressor Station in Rockland County, New York and the existing Southeast Compressor Station in Putnam County, New York (i.e., the Stony Point to Yorktown Take-up and Relay segment). For this segment, Algonquin proposes to increase compression at the Stony Point Compressor Station and replace about 12.3 miles of 26-inch-diameter pipeline downstream of the compressor station with a new, 42-inch-diameter pipeline. The larger diameter pipeline is necessary to increase capacity and maintain the required pressure profile of the pipeline segment downstream of the Stony Point Compressor Station until the gas in the pipeline can be re-compressed at the Southeast Compressor Station.

Because the locations of the proposed pipeline replacements and loops are based on flow dynamics within the system, alternative locations or configurations would not be practical. Shifting the proposed facilities upstream or downstream of their current proposed locations would fail to create the additional capacity or pressure profiles within each pipeline segment to provide capacity for the additional volumes of natural gas and operate the system efficiently.

As an example, Algonquin is proposing to replace about 4.5 miles of 26-inch-diameter pipeline with a new, 42-inch-diameter pipeline in Putnam County, New York and Fairfield County, Connecticut downstream of the existing Southeast Compressor Station (i.e., the Southeast to MLV 19 Take-up and Relay segment). The pipeline replacement would create the additional capacity and flow characteristics necessary to operate the Project downstream of the Southeast Compressor Station. Shifting the pipeline replacement segment upstream of the compressor station would increase capacity on that segment, but create a bottleneck for delivery in areas downstream of the compressor station. This is because Algonquin would be unable to deliver additional volumes of natural gas downstream of the Southeast Compressor Station without a larger diameter pipe.

Additional information on facility design and siting is provided by Project component in the subsections below. The location of each facility component is described in section 2.1 and depicted on figure 2.1-1.

### **3.4.1 Take-up and Relay**

At three locations (i.e., the Haverstraw to Stony Point, Stony Point to Yorktown, and Southeast to MLV 19 Take-up and Relay segments), Algonquin proposes to replace the existing 26-inch-diameter mainline with a new 42-inch-diameter pipeline. In conjunction with increased compression, the larger diameter pipeline in these segments would increase the carrying capacity of the mainline system, allowing Algonquin to meet its contractual obligations to existing customers and also provide the additional volumes of natural gas required by the Project Shippers. In each of these locations, replacement of the existing pipeline would maximize the use of existing right-of-way, which would minimize impacts on the environment during construction. While new pipeline loops in these same areas could similarly create additional capacity on the system, these are not considered feasible alternatives due to urbanization in the vicinity of the mainline and encroachment on the existing right-of-way. Relative to pipeline replacements, pipeline loops would require a wider construction corridor in areas where available space is limited and existing land uses preclude expanding the width of the existing right-of-way.

In another location (i.e., the E-1 System Lateral Take-up and Relay segment), the existing 6-inch-diameter pipeline cannot support the proposed incremental capacity of the Project. A larger, 16-inch-diameter pipeline is necessary to increase capacity to facilitate the transportation of additional natural gas volumes to an existing delivery point on the system. As with the other take-up and relay segments, replacement of the existing pipeline would maximize use of the existing right-of-way and minimize impacts on the environment during construction.

### **3.4.2 Loop Extension**

At two locations (i.e., the Line-36A Loop Extension and E-1 System Lateral Loop), Algonquin proposes to extend existing pipeline loops to increase the transmission capacity of the system. In each of these areas, Algonquin's engineers have determined that extension of existing pipeline loops would be preferable to pipeline replacements to create the required pressure profiles to operate the system efficiently. There is less urbanization along the existing pipeline right-of-way in these areas to preclude expansion of the existing right-of-way width. Additionally, extending the existing loops would minimize the duration of outages on Algonquin's system during construction, which would minimize service disruptions to downstream customers. For each of the pipeline loops, outages would be limited to a short period of several hours during tie-in operations. In contrast, outages of several weeks would be required to remove and replace the existing pipelines in these areas.

### 3.4.3 New Pipeline

We received a number of comments on the draft EIS asking how the West Roxbury Lateral and delivery point were selected and why the deliveries to Boston Gas cannot be served by another part of Algonquin's system. According to Algonquin, Boston Gas has requested a new delivery point in the West Roxbury section of the City of Boston to enhance and reinforce the existing Boston Gas delivery system, reliability during outage situations, and support long-term growth in the area. The proposed delivery point would be located at an interconnection with the Boston Gas delivery system in an area where additional supplies of natural gas are needed. The site for the new delivery point cannot be reached by the existing Algonquin pipeline system. As a result, Algonquin proposes to construct about 4.9 miles of new pipeline lateral (West Roxbury Lateral) and a new M&R facility to provide Boston Gas with the service it has requested.

Currently, about 25 percent of peak day supplies are delivered to Boston Gas on the Algonquin J-System Lateral and about 15 percent of the peak requirements for Boston Gas are supplied from the Commercial Point LNG Peak Shaving Facility. Algonquin's J-System Lateral primarily supplies the City of Boston through six existing meter stations. The J-System Lateral is also connected to the Commercial Point LNG Facility. In the past, the Commercial Point peak shaving facility would deliver gas into the J-System Lateral for redelivery to customers served by Algonquin. These volumes provided an operational benefit to Algonquin's customers (Boston Gas and Colonial Gas) by supporting pipeline pressures on the east end of the system. However, deliveries from Commercial Point into the J-System Lateral have decreased dramatically over the last few years such that, if there were of an outage on the J-System Lateral on a cold day (i.e., 15 degrees), Algonquin anticipates widespread system outages would occur, affecting thousands of customers.

Given that the West Roxbury Lateral would be supplied from Algonquin's I-System Lateral, Boston Gas customers' exposure to the reliability risk described above would be greatly reduced. In the event of an outage on the J-System Lateral, the anticipated number of outages would be reduced by about two-thirds.

In addition to the reliability and reinforcement benefits to existing gas customers, construction of the West Roxbury Lateral would also support anticipated long-term growth in the Boston region. Historically, West Roxbury has been one of the low pressure points on the Boston Gas intermediate pressure system. By connecting a new supply point to this portion of the Boston Gas system, the West Roxbury Lateral would help enable growth in the Boston area and minimize the need for on-system distribution projects.

The West Roxbury Lateral would deliver gas into a constrained area of the Boston Gas intermediate pressure system, which is also the location where the Boston Gas intermediate pressure system comes closest to Algonquin's I-System Lateral. It may be possible to begin the West Roxbury Lateral at a different location along Algonquin's existing I-System Lateral but this would increase the length and therefore the impact of the new lateral. Additionally, we have not identified an alternate starting point for the West Roxbury Lateral that would be preferable to the proposed route.

The proposed West Roxbury M&R Station is located at a point on the intermediate pressure system that is capable of receiving sufficient volumes of gas to provide the benefits noted above. Without the new lateral, many of these new potential customers could not be served without the need for significant system reinforcement. According to Algonquin, it has reviewed gas capacity requests for loads totaling 72.9 million metric British thermal units (MMBtu) (about 27 percent of the current total

system load); of which 37 percent could not be served without construction of significant system facilities.

Another identified advantage of the proposed new delivery point is that it would facilitate ongoing planned maintenance activities by Boston Gas, such as pipeline inspections and the replacement of sections of transmission main, without the risk of customer outages or the need to supplement supplies with portable LNG operations.

Information on specific route and site alternatives for the proposed lateral and M&R station are provided in sections 3.5 and 3.6 below.

#### **3.4.4 Compressor Station Modifications**

In addition to the pipeline facilities described above, the Project would require additional compression to transport the additional volume of natural gas required by the Project Shippers. To provide the additional compression, Algonquin proposes to install two new gas-fired compressor units at the existing Stony Point Compressor Station, install one new gas-fired compressor unit at each of the existing Southeast, Cromwell, Chaplin, and Burrillville Compressor Stations, and restage one existing compressor unit at the existing Oxford Compressor Station. No new compressor stations are proposed for the Project. In conjunction with the new pipeline facilities, the additional compression provided by the new/restaged compressor units would increase the maximum design capacity of Algonquin's mainline system from about 2.6 to 2.9 bcf/d.

One of the new units to be installed at the Stony Point Compressor Station would replace four existing reciprocating units on Algonquin's existing 26-inch-diameter mainline. The new unit would be rated to replace the capacity of the existing reciprocating units while also providing the additional horsepower needed to operate the Project. The Mars 100 is the preferred unit model for the replacement because it would meet the horsepower requirements of the mainline system as well as the air emissions thresholds required in the existing air permits for the Stony Point Compressor Station. Other potential models, such as the Mars 90 or Taurus 70, were dismissed because they would not provide the required horsepower to operate the system and/or do not provide sufficient air emission reductions.

#### **3.4.5 Conclusions Regarding Facility Design and Siting**

We evaluated information filed by Algonquin and conducted our own engineering analysis to assess the facility design and locations proposed by Algonquin for the Project. We conclude that Algonquin designed the Project to maximize the efficient transportation of additional natural gas supplies through its mainline system. Additionally, the new and modified facilities would maximize the use of existing pipeline rights-of-way and aboveground facility sites, which would minimize environmental impacts during construction.

Alternative facility designs or locations potentially could increase capacity on certain segments of the system, but would result in operational inefficiencies that would inhibit the delivery of additional natural gas supplies to the Project Shippers. Moving the locations of pipeline replacement segments, for example, would fail to create additional transportation capacity at locations where it is needed to transport additional volumes of natural gas on the system. Moreover, we note that alternative designs or locations would not avoid environmental impacts, but shift them from one location to another. Therefore, for all the reasons discussed above, the alternative designs or locations considered would not be practicable or provide an environmental advantage over the Project.

### 3.4.6 Compressor Units

At the request of FERC staff, Algonquin evaluated the feasibility of installing electric-driven compressor units in lieu of gas-fired units at each of the compressor station sites. Algonquin states that it considered several factors in evaluating the type of unit to install at each site, including: proximity to existing electric power sources; the need for new or modified electric power sources or transmission facilities; the need for additional ancillary facilities, such as substations; the ability of power companies to design, permit, and construct new facilities in a timeframe reasonably close to the Project; additional environmental impacts associated with construction of new facilities; and the ability to comply with emissions standards during operations at each site.

Algonquin consulted with regional power providers in the vicinity of each compressor station to determine the need for new electric distribution facilities to provide power for electric-driven compressor units at each of the compressor station sites. Based on these consultations, between 1.5 and 8.0 miles of new electric distribution line would need to be constructed to each compressor station site to provide a primary, dedicated power source for new electric-driven compressor units. Additionally, upgrades to existing electric substations would be required at three locations, and new substations would need to be built at each existing compressor station site. It is estimated that a minimum of 2 years would be required to design, permit, and construct these new facilities.

As shown in table 3.4.6-1, construction of the new electric distribution facilities and substations would collectively affect a total of about 58.0 acres of residential, rural, and commercial lands. This would result in visual impacts on existing homes as well as impacts on wetlands, waterbodies, trees, and habitat for state-listed sensitive species. The new electric distribution line to the Chaplin Compressor Station would additionally cross the Mansfield Hollow State Park in Mansfield, Connecticut.

Another issue with the installation of electric-driven compressor units in lieu of gas-fired units is availability of backup power to each site (i.e., access to a secondary substation in the event of an outage at the primary substation). No backup power would be available to the Stony Point, Southeast, and Burrillville Compressor Stations. Backup power would be available to the Cromwell and Chaplin Compressor Stations, but would require the construction of an additional 16 miles and 10.7 miles, respectively, of new electric distribution lines. Construction of these lines would result in additional impacts on residential and rural areas as well as environmental resources.

We evaluated Algonquin's proposal to install gas-fired compressor units rather than electric-driven units at the existing compressor station sites along the mainline. The use of electric-driven compressor units would result in additional environmental impacts during construction due to installation of non-jurisdictional facilities such as electric transmission lines and substations. Also, installation of electric-driven compressors would limit the Algonquin's ability to satisfy the Project's schedule due to the time needed to permit, design, and construct these non-jurisdictional facilities. While electric-driven units would result in lower operating emissions, this advantage would be offset by the other impacts described above. In consideration of all these factors, we conclude that use of electric-driven compressor units would not be preferable to or provide a significant environmental advantage over the proposed Project.

TABLE 3.4.6-1				
Additional Power Facilities Required to Install Electric-Driven Compressor Units at Compressor Station Sites for the AIM Project				
New Electric Transmission Facilities	Additional Area Affected by Construction	Land Uses	Minimum Time to Permit, Design, and Construct	Potential Issues
<b>Stony Point Compressor Station – Rockland County, New York</b>				
2.0 miles of buried 138 kilovolt (kV) distribution cable in or along streets; upgrades to an existing substation; construction of a new substation	14 acres	Residential – 87 percent Commercial – 13 percent	2 years	Would require installation within the existing right-of-way for New York State Highway 210; if this is not feasible, the transmission cable would be longer; no backup power available
<b>Southeast Compressor Station – Putnam County, New York</b>				
2.0 miles of aboveground 46 kV distribution line in or along highways and roads; upgrades to an existing substation; construction of a new substation	4 acres	Residential – 21 percent Rural – 79 percent	2 years	Visual impacts in residential and rural areas associated with the installation of new power poles; no backup power available
<b>Cromwell Compressor Station – Middlesex County, Connecticut</b>				
1.5 miles of aboveground 23 kV distribution line, including 1 mile of greenfield corridor; construction of a new substation	11 acres	Rural – 100 percent	2 years	Up to 6 acres of tree clearing and visual impacts due to the installation of new power poles; the route would cross 4 wetlands and 1 stream; the route would affect habitat for state-listed species; a second distribution line measuring 16 miles in length would be needed for backup power
<b>Chaplin Compressor Station – Windham County, Connecticut</b>				
6.0 miles of aboveground 13.8 kV distribution line, mostly in or along existing roads or rights-of-way; construction of a new substation	17 acres	Residential – 57 percent Rural – 43 percent	2 years	Visual impacts in residential and rural areas; the route would cross Mansfield Hollow State Park; the route would cross 12 streams and 2 wetlands; the route would affect habitat for state-listed species; a second distribution line measuring up to 10.7 miles in length would be needed for backup power
<b>Burrillville Compressor Station – Providence County, Rhode Island</b>				
8.0 miles of aboveground 34 kV distribution line in or along roads; upgrades to an existing substation; construction of a new substation	12 acres	Residential – 82 percent Rural – 18 percent	2 years	Visual impacts in residential and rural areas due to installation of new power poles; the route would cross 9 streams and 9 wetlands; no backup power available

### **3.4.7 Waste Heat Generation**

A recent paper by the Interstate Natural Gas Association of America (2008) considers the potential for energy efficiency at natural gas compression facilities via recovery of waste heat. The paper identifies threshold criteria for determining whether waste heat cogeneration is feasible at these facilities. The criteria include a total of 15,000 hp of compression provided by gas turbine units operating for at least 5,250 hours per year with a 60 percent load factor.

The potential to install waste heat cogeneration facilities was evaluated at Algonquin's compressor stations that would meet the horsepower and load factor thresholds identified in the Interstate Natural Gas Association of America paper. Because there are no existing facilities in the vicinity of the compressor stations to utilize waste heat, such as heat recovery steam generators or steam turbines, it was determined that waste heat recovery is not currently a viable option for the compressor stations.

## **3.5 ROUTE ALTERNATIVES AND VARIATIONS**

### **3.5.1 Route Alternatives and Variations Evaluated Prior to Issuance of the Draft EIS**

We evaluated a route alternative at the Hudson River crossing of the Stony Point to Yorktown Take-up and Relay segment to address geological and constructability issues along Algonquin's existing mainline. We evaluated two route alternatives along the proposed West Roxbury Lateral to address impacts on existing land uses, primarily residential and commercial areas. We additionally evaluated a number of minor route variations along different components of the Project to resolve or address localized resource issues or stakeholder concerns. Each of the route alternatives and the minor route variations are discussed in the subsections below.

#### **3.5.1.1 Hudson River Northern Route Alternative**

Algonquin's mainline system includes two existing 24-inch-diameter pipelines and one existing 30-inch-diameter pipeline across the Hudson River between the Town of Stony Point, Rockland County, New York, and the Village of Buchanan in the Town of Cortlandt, Westchester County, New York. As part of the Project, Algonquin proposes to install a new 42-inch-diameter pipeline across the river in conjunction with the Stony Point to Yorktown Take-up and Relay segment. The proposed river crossing would be located about 0.5 mile south of Algonquin's existing mainline right-of-way. The three existing pipelines and the proposed pipeline would provide transportation service across the river.

We received a comment from the NYSDEC questioning the need for an additional 42-inch-diameter pipeline across the Hudson River when the three existing pipelines would continue to remain in service. Based on information filed by Algonquin, the three existing pipelines across the river do not have sufficient available capacity to accommodate the additional volume of natural gas required by the Project Shippers. The two existing 24-inch-diameter pipelines each have an MAOP of 674 psig, and the 30-inch-diameter pipeline has an MAOP of 750 psig. None of the three existing pipelines can be upgraded to a higher MAOP to accommodate additional volumes of natural gas. Therefore, either a new pipeline or the replacement of one of the existing pipelines with a new, higher capacity pipeline would be necessary to carry the additional volumes of natural gas. The removal of an existing pipeline and replacement of it with a new pipeline using the HDD method would result in greater impact than the installation of a new pipeline by HDD while leaving the existing pipelines in place.

Algonquin additionally states that it would maintain service on the three existing pipelines across the river to enhance system reliability. In the event of an outage on the existing 30-inch-diameter pipeline or the proposed 42-inch-diameter pipeline across the river (e.g., due to upstream maintenance activities),

the two existing 24-inch-diameter pipelines could continue to provide service (at lower operating pressures) to minimize the interruption of service or reduction of flows to downstream points on the system. Without the two existing 24-inch-diameter pipelines across the river, an outage of either the existing 30-inch-diameter pipeline or proposed 42-inch-diameter pipeline could result in significant natural gas losses in the system, which would impact power producers and industrial, commercial, and residential consumers in southern New England.

We evaluated two potential crossings of the Hudson River: the proposed route, which deviates from the existing Algonquin right-of-way, and an alternative route that follows the existing right-of-way (Hudson River Northern Route Alternative). As shown in figure 3.5.1-1, each route originates at MP 2.6 and terminates at MP 5.5 of the Stony Point to Yorktown Take-up and Relay. From the starting point, the proposed route initially heads south/southeast for about 0.5 mile away from the existing mainline right-of-way. It then heads east/southeast for about 1.0 mile crossing from the west to the east bank of the river. It then heads northeast for about 1.3 miles, terminating at the existing mainline right-of-way. The Hudson River Northern Route Alternative is parallel to and on the north side of the existing mainline right-of-way across the river. Both routes cross portions of the existing Indian Point Energy Center (IPEC) nuclear facility on the east bank of the river in Westchester County, New York. We assumed use of an HDD construction method for the river crossing along either the proposed or alternative routes to avoid in-water impacts within the Hudson River.<sup>2</sup>

Table 3.5.1-1 compares engineering and select environmental data for each route. The Hudson River Northern Route Alternative is about 0.6 mile shorter and would cross less wetland than the proposed route. The alternative route, however, would pass near more houses than the proposed route, though the total number of houses potentially affected by either route would be small.

TABLE 3.5.1-1 Comparison of the Hudson River Northern Route Alternative to the Corresponding Segment of the Proposed Route for the AIM Project			
Environmental/Engineering Factor	Unit	Proposed Route	Alternative Route
Length (mileposts 2.6 to 5.5)	miles	2.9	2.3
Length adjacent to the existing right-of-way	miles	0.0	2.3
Length of the horizontal directional drill	feet	3,800	6,550
Number of residences within 50 feet <sup>a</sup>	number	2	3
Number of residences within 100 feet <sup>a</sup>	number	3	7
Wetland crossings	linear feet	842	376
Wetland impacts	acres	1.9	0.7
Waterbody crossings	number	2	2
<sup>a</sup> Includes residential housing complexes. Each contiguous building was counted as a single residence.			

<sup>2</sup> The existing 24-inch-diameter pipelines and 30-inch-diameter pipeline across the river were installed in the late 1950s and early 1960s using the open-cut construction method.

**AIM Project**  
Hudson River Northern  
Route Alternative

The proposed route would also cross close to St Patrick's Church and the Buchanan-Verplanck Elementary School. Algonquin has agreed to additional design and installation enhancements for construction and operation near the IPEC facility, which it would also apply to the portion of the proposed pipeline near the school. A discussion of impacts on St. Patrick's Church and Buchanan-Verplanck Elementary School is provided in section 4.8.5.

A major difference between the two routes would be the length of the HDD crossing. Due to differences in the width of the river at each crossing, the HDD for the alternative route would be 2,750 feet longer than the proposed route. The differences in the length of the HDD would be compounded by bedrock conditions along the alternative route, which are unfavorable to a successful HDD crossing, and by land use conflicts within the IPEC nuclear facility, which would provide limited workspace for the HDD on the east side of the crossing.

The depth of the hard bedrock at the river crossing on the alternative route is a significant issue. Based on publicly available geotechnical information, the bedrock profile near the middle of the Hudson River in the area of the HDD drill path is up to 300 feet below river bottom. A shallower drill profile in these conditions would require passing into and out of bedrock in several places and into the glacial till, sand, and clay deposits. This would increase the risk of inadvertent returns of drilling fluid or complications during construction, potentially including failure of the drill. A deeper drill profile entirely within bedrock would require extreme pull loads during pullback, resulting in the risk of structural failure of the pipeline.

The difficulties of an HDD crossing of the Hudson River on the alternative route would be compounded by the length of the HDD, which would be about 6,550 feet long. A successful HDD of this length and in these geological conditions would be technically challenging and unprecedented. We are not aware of any previous HDDs of the same diameter and length that have been attempted in similar bedrock conditions in North America. Additionally, the time required to complete a drill at this crossing would exceed 12 months.

The existing geological conditions along the proposed route are more favorable for a successful HDD crossing of the Hudson River. As discussed in detail in sections 4.1.7 and 4.3.2.3, geotechnical studies conducted by Algonquin indicate that an HDD along the proposed route could be completed within soft clay by passing over the bedrock and glacial till deposits beneath the river. Moreover, the shorter length of the HDD along the proposed route (3,800 feet) is less technically challenging for a 42-inch-diameter pipe, and would reduce the time required to complete the HDD across the river (relative to the alternative route) by 9 to 10 months. We also note that several previous HDD crossings at this length and in these conditions have been completed in North America, including a recent crossing of the Hudson River. Spectra Energy completed an HDD of the Hudson River between Jersey City, New Jersey and lower Manhattan as part of the New Jersey-New York Expansion Project in geological conditions similar to those along the proposed route.

In addition to complications resulting from the drill profile, hard bedrock at the surface on the west of side of the Hudson River crossing along the alternative route would make it difficult to install a steel casing at the drill entry site, which is necessary to maintain and control drilling fluid during the HDD operation. The softer surface sediments on the west side of the river crossing along the proposed route would make it easier to install a steel casing at this location. This, along with the shorter time required to complete the HDD along the proposed route, would help reduce the potential for inadvertent returns of drilling fluid during construction.

Another disadvantage of the Hudson River Northern Route Alternative is the limited amount of space available for pullback operations within the IPEC facility on the east side of the crossing.<sup>3</sup> Algonquin would be limited to about 500 feet of workspace to assemble the pipe string for the HDD. As a result, Algonquin would need to assemble the pipe string (i.e., position, weld, x-ray, and coat individual pipe joints) in 13 sections. This would increase the risk of the pipeline becoming stuck in the drill hole during the pullback operation because the pipeline would be idle as each section of the pipe string is assembled. Algonquin estimates that pullback operations for the Hudson River Northern Route Alternative crossing would require one week or more to complete. Two existing access roads within a security zone at the IPEC facility would need to be closed for this entire period.

In contrast, there is more available workspace for pullback operations on the east side of the Hudson River along the proposed route. As a result, only three pipe string sections would be required, which would reduce the time needed to complete pullback operations and the risk of the pipeline becoming stuck in the drill hole. Additionally, although the workspace for the pullback operation would be within the IPEC facility, it would be outside the security zone and would not require the closure of any exiting access roads.

Another issue and difference between the proposed route and the alternative pertains to the potential for operational conflicts with the IPEC facility. We received a comment from the New York State Attorney General's Office noting the proximity of Algonquin's existing pipelines to a potential location for a closed-cycle cooling system for Indian Point Unit 3, and citing concerns that a new pipeline in this area, immediately south of the IPEC security zone, could impede the construction of such a cooling system. The proposed route would be located about 0.5 mile south of the IPEC security barrier, and would not impact construction of a closed-cycle cooling tower.

There is also a difference between the two routes regarding their potential safety risks. Entergy, the operator of the IPEC, stated in a letter to FERC on September 29, 2014, that it is currently opposed to the Northern Route Alternative because it would put the pipeline closer to the IPEC facilities. It also said that, based on currently available information, the Northern Route Alternative could reduce the margin of safety when compared to the proposed route. In contrast, Entergy indicated that "based on the proposed routing of the 42-inch-diameter pipeline further from safety related equipment at IPEC, and accounting for the substantial design and installation enhancements agreed to by [Algonquin], the proposed AIM Project poses no increased risks to IPEC and there is no significant reduction in the margin of safety." The U.S. Nuclear Regulatory Commission (NRC) has concurred with these findings during its own, independent analysis (see section 4.12.3).

While the alternative route crossing for the Hudson River provides certain environmental advantages over the proposed crossing, including its greater distance from St Patrick's Church and Buchanan-Verplanck Elementary School, and its reduction in land disturbance and wetland impacts, the Hudson River Northern Route Alternative would not be technically feasible. The probability of drill failure is significantly higher for the alternative route. If this were to occur, multiple attempts at the HDD or an alternative crossing method (such as the open cut method) could be required, which would increase the time required to complete the crossing and/or result in additional impacts on the environment. We also received many comments concerning the location of the pipeline in relation to the IPEC facilities and potential safety risks. The alternative is currently opposed by Entergy due to its closer proximity to IPEC

---

<sup>3</sup> There is insufficient available space on the west side of the Hudson River in the vicinity of Algonquin's existing mainline to assemble the HDD pipeline for pullback operations. The existing mainline passes through residential areas on the west side of the river.

facilities and increased safety risk. Therefore, the alternative route would not be preferable to or provide a significant environmental advantage over the proposed route.

### 3.5.1.2 West Roxbury Lateral Alternative Route

As shown in figure 3.5.1-2, the West Roxbury Lateral Alternative Route originates at about MP 3.0 of the proposed route in the Town of Dedham, Norfolk County, Massachusetts. From this point, the alternate route extends to the northwest for about 0.7 mile, paralleling Incinerator Road and crossing several parking lots and driveways. It then heads north for about 0.5 mile, parallel to and on the east side of State Route 1, crossing into West Roxbury in the City of Boston, Suffolk County, Massachusetts. The alternative route then follows an abandoned right-of-way for about 0.5 mile to the north before intersecting Belle Avenue. From there, the alternative route continues to the north for about 1.0 mile following a number of roads through residential and commercial areas, including Belle Avenue and Baker, Spring, and Alaric Streets. It intersects the proposed route at about MP 5.0.

Table 3.5.1-2 compares crossings of select environmental and other features along the West Roxbury Lateral Alternative Route to the corresponding segment of the proposed route. As shown in the table, the alternative route is about 0.1 mile longer, but would require 0.5 mile less construction within roadways and cross five fewer roads. The alternative route would pass within 50 and 100 feet of fewer residences than the proposed route, but more of the alternative route would pass through residential neighborhoods. Both routes would avoid wetlands and cross the same number of waterbodies.

TABLE 3.5.1-2 Comparison of the West Roxbury Lateral Alternative Route to the Corresponding Segment of the Proposed Route for the AIM Project			
Environmental/Engineering Factor	Unit	Proposed Route	Alternative Route
Length (MPs 3.0 to 5.0)	miles	2.0	2.1
Construction within roadway	miles	1.8	1.3
Number of residences within 50 feet <sup>a</sup>	number	161	83
Number of residences within 100 feet <sup>a</sup>	number	185	132
Wetland crossings	feet	0	0
Waterbody crossings	number	1	1
Road crossings	number	24	19
<sup>a</sup> Includes residential housing complexes. Each contiguous building was counted as a single residence.			

During the initial stakeholder outreach, public officials representing the City of Boston expressed concern to Algonquin regarding the alternative route because of its proximity to residential neighborhoods. The alternative route would cross through the backyards of houses, impact residential streets, and cause significant disruption to the surrounding neighborhoods, particularly along Belle Avenue in West Roxbury. Construction along the alternative route would require the complete closure of streets within these areas. Although the proposed route would pass near more residences, it primarily would be constructed along and within more established roadways (e.g., Washington, Grove, and Centre Streets) and in parking lots of commercial and industrial properties. Additionally, the proposed route would avoid the residential area along Belle Avenue and result in fewer impacts on homes and neighborhoods. For this reason, the West Roxbury Lateral Alternative Route would not be preferable to or provide a significant environmental advantage over the proposed route.

**West Roxbury Lateral**  
**Alternative Route**

### 3.5.1.3 West Roxbury Lateral South End Alternative Route

As shown in figure 3.5.1-3, the West Roxbury Lateral South End Alternative Route originates just north of Interstate 95 at about MP 0.5 of the proposed route in the Town of Westwood, Norfolk County, Massachusetts. From this point, the alternate route extends to the east/northeast for about 0.5 mile, parallel to and on the north side of Interstate 95, including an off ramp connecting to the Boston Providence Turnpike. The alternative route then heads north for about 0.2 mile, parallel to and east of the Boston Providence Turnpike. It intersects the proposed route at about MP 1.2.

Table 3.5.1-3 compares the West Roxbury Lateral South End Alternative Route to the corresponding segment of the proposed route. While both routes measure about 0.7 mile in length, the alternative route would require 0.5 mile less of construction within roads, pass near fewer residences, and cross two fewer roads than the proposed route. Both routes would avoid wetland and waterbody crossings.

TABLE 3.5.1-3 Comparison of the West Roxbury Lateral South End Alternative Route to the Corresponding Segment of the Proposed Route for the AIM Project			
Environmental/Engineering Factor	Unit	Proposed Route	Alternative Route
Length (MPs 0.5 to 1.2)	miles	0.7	0.7
Construction within roadway	miles	0.6	0.1
Number of residences within 50 feet <sup>a</sup>	number	11	5
Number of residences within 100 feet <sup>a</sup>	number	13	7
Road crossings	number	5	3
Railroad crossings	numbers	1	1
<sup>a</sup> Includes residential housing complexes. Each contiguous building was counted as a single residence.			

The primary advantage of the West Roxbury Lateral South End Alternative Route is that it would avoid construction within Rustcraft Road and Elm Street, which would eliminate impacts adjacent to an apartment complex and several businesses, particularly along Elm Street. The primary disadvantages of the alternative route are that it would parallel Interstate 95, which would result in limited construction workspace; require the removal of existing sound abatement walls along the highway; and result in impacts on several houses. Moreover, installation of the pipeline lateral adjacent to Interstate 95 would be inconsistent with MassDOT's "Policy on the Accommodation of Utilities Longitudinally, Along Controlled-Access Highways," which precludes the placement of utility infrastructure parallel to the interstate highway system absent extenuating circumstances.

Several commentors believe that MassDOT's policy should not be considered over local preferences and believe that the Project poses "extenuating circumstances" warranting a waiver of MassDOT's policy. Impacts on the public for the proposed route are addressed throughout section 4. We do not find that the Project, as proposed with Algonquin's mitigation measures, would result in significant impacts along the southern portion of the West Roxbury Lateral, including traffic impacts at the intersection of Elm Street and Providence Highway. Therefore, we disagree that requesting a waiver of MassDOT's policy is warranted simply for local convenience. Additional considerations of local impacts for the alternative route are discussed below.

US Survey Feet, Grid North

**Figure 3.5.1-3**  
**AIM Project**  
**West Roxbury South End**  
**Alternative Route**

The West Roxbury Lateral South End Alternative Route would result in direct impacts on two residences adjacent to the off ramp connecting Interstate 95 with State Route 1A, near Robinwood Road. The residences are located about 10 and 20 feet from the sound abatement wall for the highway. Installing the pipeline through this area would require the temporary removal of the sound abatement wall resulting in highway traffic noise for several months at the residences until the wall could be replaced.

The alternative route would also impact three commercial properties and two motel properties. Due to the existing elevated slope along Interstate 95, extensive grading would be required to install the pipeline adjacent to the highway. This would require ATWS and additional tree clearing along the highway. The additional tree clearing would result in the permanent removal of privacy/nuisance screening between the commercial and motel properties along the Interstate 95 corridor.

Another disadvantage of the alternative route would be traffic impacts on the Legacy Place shopping area in the Town of Dedham. The focus of Legacy Place's concern at the shopping mall is the ability to manage traffic impacts during construction. The West Roxbury Lateral South End Alternative Route would affect traffic at two of the three ingress/egress points for Legacy Place. Additionally, the crossing of the intersection of Elm Street and the Providence Highway could disrupt traffic entering and exiting Legacy Place along Elm Street. See section 4.9.5 for a discussion of traffic impacts that would result from construction of the proposed route.

In consideration of the potential impacts on residences and businesses, as well as constraints associated with installation of the pipeline adjacent to an interstate highway, as documented in our analysis, the West Roxbury Lateral South End Alternative Route would not be preferable to or provide an environmental advantage over the proposed route.

#### **3.5.1.4 Minor Route Variations**

Algonquin incorporated six minor route variations along different segments of the proposed pipeline facilities to avoid or reduce impacts on environmental or other resources, resolve engineering issues, or address stakeholder concerns (e.g., to minimize impacts on a golf course). Each of these route variations was incorporated into the Project design by Algonquin prior to issuance of the draft EIS as part of the proposed action. Information on the six route variations, including their purpose and primary advantages and disadvantages relative to the original route, is provided in table 3.5.1-4. We have reviewed the information filed by Algonquin on these six route variations and our analysis of the proposed route in section 4.0 of this EIS includes these variations as part of the proposed action except where changed by modifications made following issuance of the draft EIS (see section 3.5.2). At the time of the draft EIS, we concurred with these route variations.

At the time of the draft EIS, we had also evaluated an additional route variation, the Catskill Aqueduct Variation, between MPs 10.2 and 10.3 of the Stony Point to Yorktown Take-up and Relay segment in Westchester County, New York. However, the results of soil investigations and geotechnical work were pending at the time. Additional information is now available and a revised evaluation has been conducted (see section 3.5.2.1).

#### **3.5.2 Route Alternatives and Variations Evaluated After Issuance of the Draft EIS**

Following issuance of the draft EIS, Algonquin evaluated several route variations it incorporated into its proposed route and we received comments requesting that we evaluate additional alternatives and variations to the proposed route. Our assessment of these alternatives and variations is included below.

TABLE 3.5.1-4

**Minor Route Variations Incorporated into the AIM Project Prior to Issuance of the Draft EIS**

Milepost		County/ State	Length (feet)	Description	Primary Advantages	Primary Disadvantages
Start	End					
Haverstraw to Stony Point Take-up and Relay – Stacey Court Variation						
1.7	1.9	Rockland, NY	1,000	The route variation is offset about 40 feet to the south of the existing pipeline.	The route variation would reduce impacts on existing and planned future residences.	The route variation would require an additional 0.8 acre of tree clearing.
Stony Point to Yorktown Take-up and Relay – Route 9 Route Variation						
5.8	5.9	Westchester, NY	528	The route variation is offset between about 20 and 50 feet to the north of the existing pipeline.	The route variation would provide a better alignment for a trenchless crossing of Route 9.	The route variation would require an additional 0.1 acre of temporary workspace and 0.1 acre of permanent easement.
West Roxbury Lateral – Norfolk Golf Club Variation						
0.0	0.1	Norfolk, MA	370	The route variation is offset about 175 feet to the southwest of the original route.	The route variation would avoid a compost area at the Norfolk Golf Club, which was requested by the landowner.	The route variation would cross a tee box, fairway, and water hazard on the golf course. A new route variation in this area was analyzed following issuance of the draft EIS (see section 3.5.2).
West Roxbury Lateral – Soccer Field Variation						
2.4	2.6	Norfolk, MA	792	The route variation is offset about 175 feet to the east of the original route.	The route variation would avoid placement of the pipeline within a roadway entrance to Staples; the route variation additionally would avoid land use conflicts with planned future expansions of the Harris Street Bridge and Boston Providence Turnpike by MassDOT.	The route variation would result in an additional 0.3 acre of impact within a soccer field at Gonzalez Field. A new route variation in this area was analyzed following issuance of the draft EIS (see section 3.5.2).
West Roxbury Lateral – Mother Brook Variation						
3.0	3.2	Norfolk, MA	845	The route variation is offset up to about 250 feet to the northwest of the original route.	The route variation would allow for a crossing of Mother Brook without the need to close Washington Street, which would minimize traffic impacts.	The route variation would result in temporary construction impacts on businesses and homes along Eastbrook Road and Post Lane. A new route variation in this area was analyzed following issuance of the draft EIS (see section 3.5.2).
West Roxbury Lateral – Centre Street Variation						
5.1	5.1	Suffolk, MA	422	The route variation extends the northern terminus of the West Roxbury Lateral to facilitate a tie-in with existing Boston Gas facilities.	The route alternative would avoid construction activities at the intersection of Centre and Spring Streets, which would minimize traffic impacts.	The route variation would require construction adjacent to St. Theresa of Avila Parish and School. A new route variation in this area was analyzed following issuance of the draft EIS (see section 3.5.2).

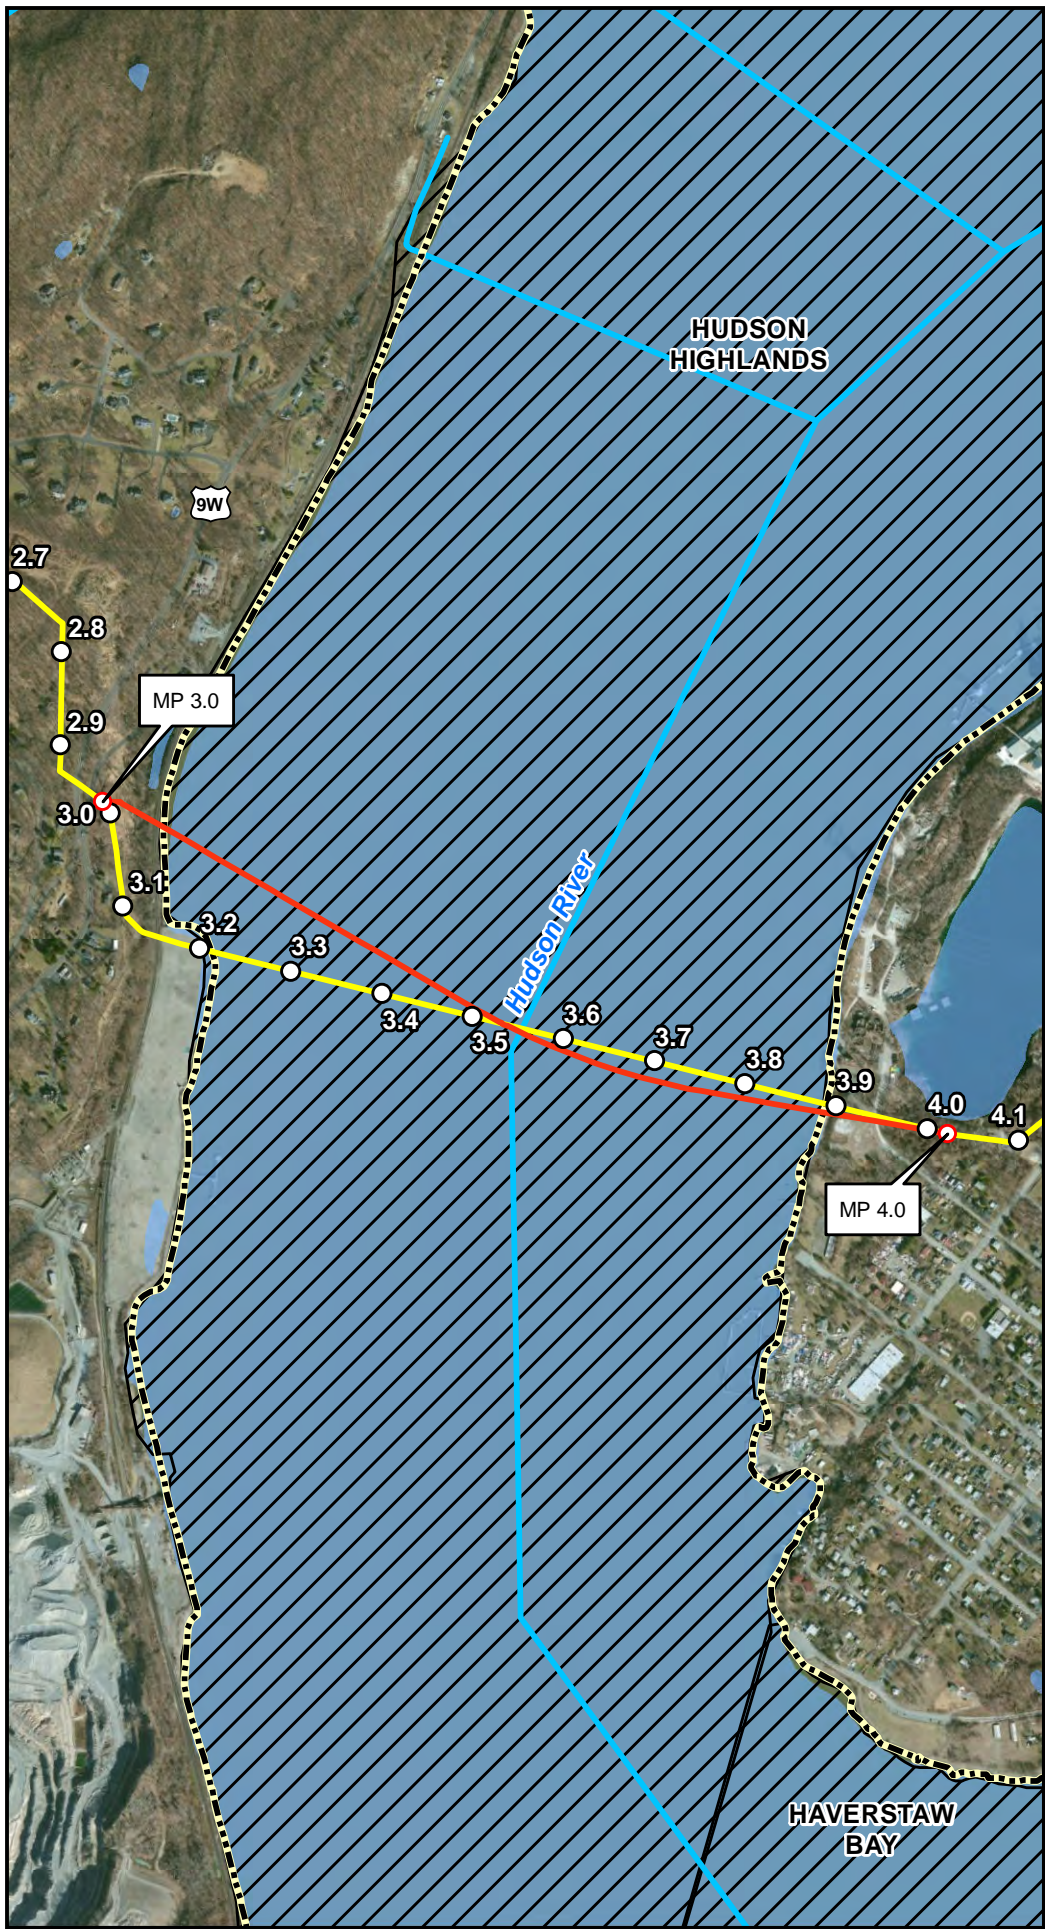

### 3.5.2.1 Stony Point to Yorktown Take-up and Relay Segment Alternatives and Variations

#### Hudson River HDD Variation

Algonquin has continued to finalize the design details of the Hudson River HDD. This included evaluating possible engineering options to safely penetrate the existing sheet pile wall at the current entry/exit side on the west side of the river. According to Algonquin, as the detailed design progressed, Algonquin was notified by the landowner, NRG Lovett, LLC, that the location of the proposed HDD entry/exit location on the west side of the river within the former NRG Lovett, LLC power plant property is now occupied by contractors responsible for the construction of the new Tappan Zee Bridge. Following additional engineering evaluation, Algonquin also recognized that constructing the pipe penetration through the existing sheet pile wall would pose significant challenges and that in-water work within the Hudson River would be required to complete this aspect of the construction. To mitigate the effects of these challenges, Algonquin evaluated relocating the western HDD entry/exit point about 850 feet northwest of the previously proposed location. The new length of the Hudson River HDD would be 5,090 feet. As shown on figure 3.5.2-1, the new entry/exit location would be located close to the previously proposed alignment on property also owned by NRG Lovett, LLC. A new temporary access road would be required to access the new HDD entry/exit location on the west side of the river. This new access road, which is about 50 feet long, is an existing unimproved road that extends from West Shore Drive, which is currently used to provide access to the existing overhead power lines. This new access road would not require any permanent improvements.

An environmental comparison of the Hudson River HDD Alignment Variation (MPs 3.0 to 4.0) to the previously proposed route is presented in table 3.5.2-1. Overall the length of the variation would be slightly shorter, but the length of the HDD segment of the variation would increase from 4,452 feet to 5,090 feet. The substrate crossed by the adjusted Hudson River HDD alignment would not change (i.e., like the previously proposed HDD alignment, the new HDD alignment would remain within the soft sediments beneath the river). The potential noise impact due to HDD construction activities at the surrounding noise-sensitive areas (NSA) would not be significantly different between the two routes. Moreover, the variation would reduce wetland impacts by about 0.1 acre, and while there is a small isolated *Phragmites*-dominated wetland within the proposed workspace for the HDD variation, this wetland would be enclosed with silt fence and not directly impacted by construction. The variation would also have the following advantages over the previously proposed route. Specifically, it would:

- reduce the overall construction workspace required from 4.7 to 3.0 acres;
- avoid the logistical concerns associated with the Tappan Zee Bridge construction activities on the former NRG Lovett, LLC power plant property;
- eliminate the required in-water construction activities necessary to support construction through the existing sheet pile wall along the perimeter of the former NRG Lovett, LLC power plant property;
- avoid what Algonquin has termed the complex construction associated with penetrating the existing sheet pile wall with casing pipe; and
- eliminate the need for crossing the existing railroad tracks to access the construction site with equipment, materials, and personnel on a daily basis.

**Legend**

- Mileposts
- Previously Proposed Route

- NWI Wetlands

**Figure 3.5.2-1**  
**AIM Project**  
**Stony Point to Yorktown**  
**Take-up and Relay**  
Hudson River HDD  
Variation

TABLE 3.5.2-1

**Comparison of the Hudson River HDD Alignment Variation to the  
Corresponding Segment of the Previously Filed Route for the AIM Project**

Environmental/Engineering Factor	Unit	Previously Filed Route	Variation (Currently Proposed Route)
Length (MPs 3.0 to 4.0)	miles	0.99	0.96
Land temporarily affected during construction	acres	4.7	3.0
New land permanently affected for operation	acres	1.3	0.2
Number of residences within 50 feet	number	0	0
Wetlands affected	acres	0.1	0
Waterbody crossings	number	0	0
Road crossings	number	1	1
Railroad crossings	number	1	1

Because this HDD alignment shift avoids conflicts with the construction laydown area for the Tappan Zee Bridge contractors, avoids in-water construction work related to penetrating the sheet pile wall at the current entry/exit site, and results in an overall reduction in construction workspace, we find it is preferable to the corresponding segment of the previously proposed alignment and concur with Algonquin's proposal to incorporate it and the proposed workspace modification into the proposed route and Project design.

#### **Blue Mountain Reservation Variation**

We evaluated a potential pipeline variation to the north of the current pipeline right-of-way in the Blue Mountain Reservation in response to a comment we received about the proximity of the pipeline to a pond located south of the alignment between MPs 7.97 and 8.01 and concerns about the potential impact of construction in this area on amphibians. The proposed pipeline route and construction workspace in this area would be located in uplands between 20 and 65 feet north of the wetland bordering the pond. Algonquin would replace the existing pipeline with the new pipeline in the same trench as the existing pipeline to be removed. The variation would shift the pipeline alignment about 100 feet to the north. Because there is another utility corridor abutting the north side of Algonquin's existing right-of-way at this location, the variation would need to cross this utility corridor twice, once to put the proposed pipeline north of the corridor and then a second time to return to the proposed alignment after passing by the pond. These crossings of the existing utility corridor and the new right-of-way resulting from the shift would increase the amount of temporary and permanent workspace and land disturbance as well as the amount of temporary and permanent forest clearing that would be needed to install the pipeline. Although we recognize the proximity of the proposed route to the pond may increase the potential to encounter amphibians, we do not believe this outweighs the impact of the extra right-of-way and tree clearing that would be required for the alternative, especially because the impacts of the proposed route would be minimized by Algonquin's implementation of its E&SCP. Therefore, we do not find the Blue Mountain Reservation Variation should be incorporated into the proposed route.

#### **Catskill Aqueduct Variation**

At the time of the draft EIS, we had conducted a preliminary evaluation of the Catskill Aqueduct Variation, between MPs 10.2 and 10.3 of the Stony Point to Yorktown Take-up and Relay segment in Westchester County, New York, and found it acceptable but not preferable to the previously proposed route. However, soil investigations and geotechnical work was pending at the time. The existing mainline pipelines at this location cross the Catskill Aqueduct near its intersection with Croton Avenue.

Algonquin's previously proposed action was to replace the existing 26-inch-diameter pipeline with a 42-inch-diameter pipeline along the same alignment. Based on the additional geotechnical work, engineering studies, and information obtained from the NYCDEP, Algonquin is now proposing to incorporate the Catskill Aqueduct Variation into its Project design. The variation would move the pipeline route about 50 feet south of the current alignment to achieve sufficient vertical clearance between the new pipeline and the Catskill Aqueduct. The variation would also provide improved alignment and workspace to complete the crossing of Croton Avenue and the aqueduct. The variation would diverge from the existing 26-inch-diameter pipeline for about 500 feet, about 280 feet before Croton Avenue and then continuing across Croton Avenue to about 150 feet past the aqueduct. Algonquin has indicated that the variation could be accommodated without any change in the proposed workspace. Algonquin would also remove the existing 26-inch-diameter pipeline and casing, but would not disturb the existing protective concrete slab, pending concurrence from NYCDEP.

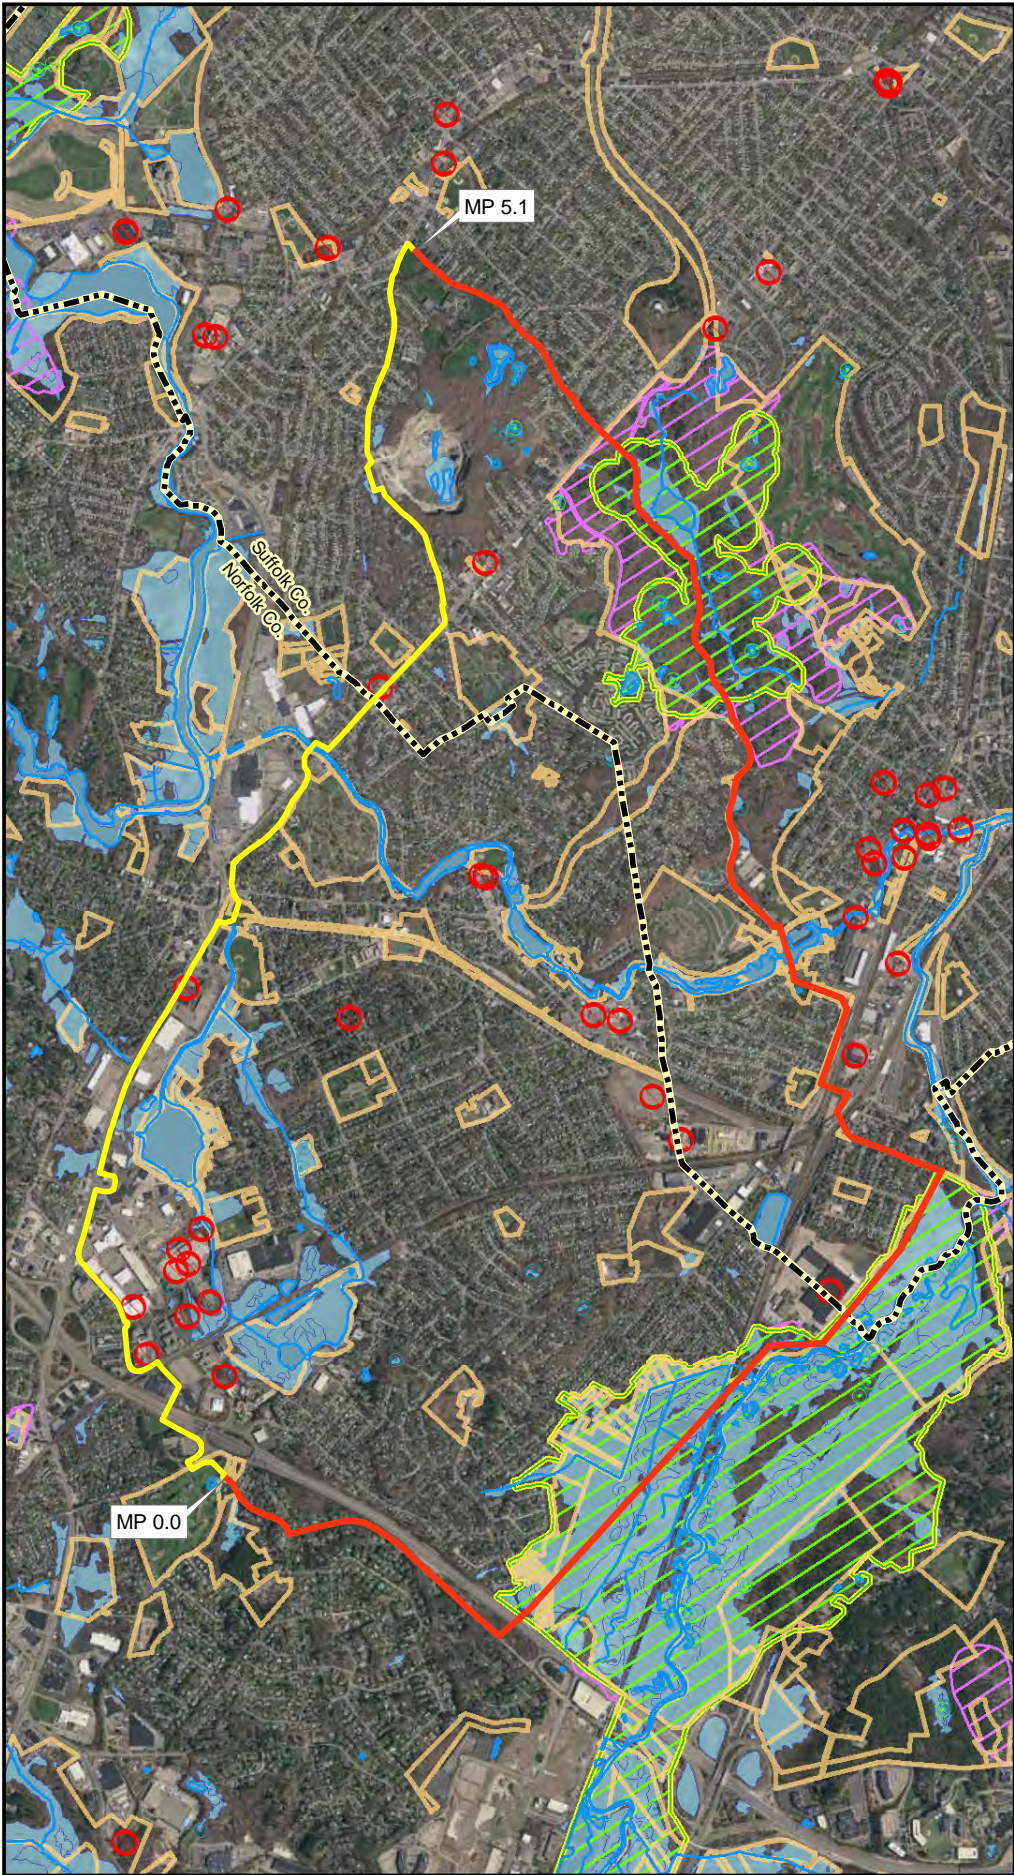

Environmental impacts associated with the corresponding segment of the previously proposed action and the Catskill Aqueduct Variation would be similar, though the route variation would require more tree clearing than the previously proposed alignment. However, this would be offset by the more preferable alignment across Croton Avenue and the Catskill Aqueduct. Algonquin would also implement several measures to minimize impacts on the aqueduct, including installation of an 8-inch-thick concrete slab about 2 feet above the aqueduct and installation of steel casing pipe around the pipeline. Based on the advantages of a more preferable alignment across Croton Avenue and the aqueduct, we find the Catskill Aqueduct Variation to be preferable and agree with its incorporation into the proposed Stony Point to Yorktown Take-up and Relay segment.

### **3.5.2.2 West Roxbury Lateral Alternatives and Variations**

#### **Neponset River State Park and Stony Brook State Reservation Alternative**

A commentor suggested an alternative that would cross the Neponset River State Park and Stony Brook Reservation, with the goal of reducing residential impacts and safety risks. We identified and evaluated a route that would begin at the same location as the proposed route then cross the Norfolk Golf Club before entering Canton Street and proceeding southeast to Blue Hill Drive. The alternative would be installed within these roads and would cross Interstate 95, after which it would enter Neponset River State Park. From there it would proceed northeast across the length of the park crossing wetlands and streams and the Neponset River twice before joining up with and following the east side of Meadow Road still within the park. Upon reaching Neponset Valley Parkway, the alternative would turn and proceed north and west within the parkway to River Street where, after a short distance, it would cross Mother Brook Pond. On the north side of the pond it would follow Turtle Pond Parkway within the road northwest to Enneking Parkway. From there it would follow the west side of Enneking Parkway across the Stony Brook State Reservoir. Near the north end of the state reservoir property, the alternative would turn to the northwest and follow Maplewood Street to St. Theresa Avenue and then St. Theresa Avenue until it joins the end of the proposed lateral and the proposed West Roxbury M&R Station site. Figure 3.5.2-1 shows the location of the alternative considered.

**Figure 3.5.2-2**  
**AIM Project**  
**West Roxbury Lateral**  
 Neponset River State Park  
 and Stony Brook State  
 Reservation Alternative

As indicated in table 3.5.2-2, the alternative would be about 2 miles longer than the proposed route but would reduce in-street construction by about 1.0 mile. However, a greater percentage of the in-street work associated with the alternative would be in residential areas versus commercial areas, such that the alternative would increase the crossing of residential neighborhoods by 0.9 mile. The alternative would also increase the crossing of public lands associated with Neponset River State Park and Stony Brook Reservation and would include four more waterbody crossings than the proposed route. Both routes would cross Mother Brook, but the crossing area of Mother Brook along the alternative would be at a point where the brook is ponded due to a nearby downstream dam. A pipeline crossing at this location would be very challenging due to workspace constraints but we were not able to find a more suitable crossing site. The alternative would also result in more tree clearing and would impact about 13.9 acres of wetlands, including 7.4 acres of woody wetlands, mostly within the Neponset River State Park, that would be completely avoided by the proposed route. The alternative would also preclude Algonquin's adoption and the resulting benefits of the St. Theresa Parish Variation. This variation, which was proposed after the draft EIS was issued, would eliminate about 375 feet of the previously proposed route along St. Theresa Avenue, which serves as the primary entrance road for both St. Theresa Parish and School and The Roxbury Latin School (see a discussion of this variation below). For these reasons, we do not believe the Neponset River State Park and Stony Brook State Reservation Alternative would be preferable to the proposed West Roxbury Lateral Route; therefore, it was eliminated from further consideration.

TABLE 3.5.2-2			
Comparison of the Neponset River State Park and Stony Brook State Reservation Alternative to the Corresponding Segment of the Proposed Route for the AIM Project			
Environmental/Engineering Factor	Unit	Proposed Route	Alternative
Length (MPs 0.0 to 5.1)	miles	5.1	7.1
In-street construction	miles	4.7	3.7
Total wetlands affected	acres	0.0	13.9
Woody wetlands affected	acres	0.0	7.4
Waterbody crossings	number	1	5
Residential neighborhoods crossed <sup>a</sup>	miles	2.1	3.0
Commercial areas crossed <sup>b</sup>	miles	2.6	0.7
<sup>a</sup> Reflects miles of in-street construction that would be within primarily residential neighborhood streets			
<sup>b</sup> Reflects miles of in-street construction that would within primarily commercial areas			

### Norfolk Golf Club Variation

Through its consultations with and at the request of the Norfolk Golf Club in Westwood, Massachusetts, Algonquin evaluated a route variation across the golf course between MPs 0.0 and 0.2 (see figure 3.5.2-3). At its furthest point, this variation would be about 197 feet west of the previously proposed route. As shown in table 3.5.2-3, the variation is shorter and would require less temporary and permanent right-of-way. It would also affect less playable area of the golf course and avoid the existing tee box for the 5<sup>th</sup> hole. To further reduce impacts on use of and business operation at the golf course, Algonquin has committed to complete construction across the golf course in the fall or winter months, which would allow for full restoration of the golf course features by the following season. Based on the advantages of minimizing impacts on the golf course and the fact that the area of impact of the new route alignment would be less than that of the corresponding segment of the previously proposed route, we find the Norfolk Golf Club Variation to be preferable and agree with its incorporation into the proposed West Roxbury Lateral pipeline route.

Wetlands affected	acres	0	0
Waterbody crossings	number	0	0
Road crossings	number	0	0

### **Massachusetts Bay Transit Authority Variation**

Algonquin evaluated a route variation between MPs 0.6 and 1.1 to address design considerations at the existing Massachusetts Bay Transit Authority crossing and avoid utilities within Elm Street. The shift, as shown in figure 3.5.2-4, would also move the pipeline in Rustcraft Road and Elm Street to the side away from Legacy Place and reduce potential impact on a planned “kiss and ride” parking area that will be built on Rustcraft Road. According to Algonquin, both Legacy Place and National Amusements have acknowledged that the proposed shift in alignment would be preferable to the previously proposed route because it shifts the construction away from the three exit and entrance points into Legacy Place that were crossed by the corresponding segment of the previously proposed route. Algonquin has also agreed to maintain at all times one paved lane for each turning movement during construction of the pipeline and would complete the installation of the pipeline within Providence Highway at night between 9:00 p.m. and 5:00 a.m. Based on the advantages of minimizing impacts on access to Legacy Place, we find the Massachusetts Bay Transit Authority Variation to be preferable and agree with its incorporation into the proposed West Roxbury Lateral pipeline route.

### **Gonzalez Field Variation**

Algonquin evaluated the Gonzalez Field Variation based on further discussions with the Dedham Parks and Recreation Department, which requested that Algonquin revisit the need for the route across the field to avoid a potential future bridge expansion, and the MassDOT. Algonquin’s original alignment was designed based on the understanding that the MassDOT had plans to expand the Harris Street Bridge. Upon Algonquin's further consultation, the MassDOT indicated that it has no foreseeable plans to expand the bridge. Therefore, MassDOT agreed that Algonquin could revise its alignment across Gonzalez Field by placing the pipeline closer to the Harris Street Bridge but not within the sloped area. As a result and as shown in figure 3.5.2-5, Algonquin is proposing a modified route alignment across Gonzalez Field that moves the proposed pipeline closer to Providence Highway. As shown in table 3.5.2-4, the variation would be shorter and would minimize impacts on the recreational field as well as reduce the amount of temporary and permanent right-of-way required. To further minimize impacts, Algonquin has also agreed to defer construction across Gonzalez Field until after the conclusion of the Town’s soccer program in the fall. Based on the advantages of minimizing impacts on the recreational field and the fact that the environmental impacts of the new route alignment would be less than that of the previously proposed route, we find the Gonzalez Field Variation to be preferable and agree with its incorporation into the proposed West Roxbury Lateral pipeline route.

Waterbody crossings	number	0	0
Road crossings	number	0	0

### Mother Brook Variation

Algonquin's previously proposed route deviated from Washington Street to avoid an existing box culvert that carried Mother Brook under Washington Street. Algonquin has had subsequent discussions with MassDOT and obtained the design details of the box culvert under Washington Street as well as other buried utilities. Based on this new information, Algonquin has determined that there is sufficient space above the box culvert to accommodate the pipeline within Washington Street. As a result and as shown in figure 3.5.2-6, Algonquin evaluated a variation to continue the pipeline within Washington Street between MPs 3.0 and 3.2 to avoid both the crossing of Mother Brook and the disturbance to other nearby residences and businesses along Eastbrook Street and Lower East Street. Algonquin is also proposing a shift in the pipeline location within Washington Street, between MPs 3.2 and 3.8, by about 25 feet from the westbound travel lane to the eastbound travel lane to avoid an existing buried Massachusetts Water Resources Authority water line. Algonquin is not proposing any workspace changes within this section of the route shift (i.e., between MPs 3.2 and 3.8).

A comparison of the environmental impacts of the variation versus the corresponding segment of the previously proposed route is provided in table 3.5.2-5. The advantages of the variation and pipeline shift are that they would avoid direct impacts on Mother Brook, avoid temporary construction impacts on businesses and homes along Eastbrook Street and Lower East Street, and avoid impacting the existing Massachusetts Water Resources Authority water line within Washington Street. Based on these advantages, we find the Mother Brook Variation to be preferable and agree with its incorporation into the proposed West Roxbury Lateral pipeline route.

TABLE 3.5.2-5			
Comparison of the Mother Brook Variation to the Corresponding Segment of the Previously Filed Route for the AIM Project			
Environmental/Engineering Factor	Unit	Previously Filed Route	Variation (Currently Proposed Route)
Length (MPs 3.0 to 3.8)	miles	0.83	0.14
Land temporarily affected during construction	acres	1.56	1.38
New land permanently affected for operation	acres	0	0
Number of residences within 50 feet <sup>a</sup>	number	50	48
Wetlands affected	acres	0	0
Waterbody crossings	number	1	0
Road crossings <sup>b</sup>	number	8	8

<sup>a</sup> Includes residential housing complexes. Each contiguous building was counted as a single residence.

<sup>b</sup> Although the number of road crossings is the same for the variation and the filed route, the variation avoids in-road construction along Eastbrook Road and Post Lane/Lower East Street.

## St. Theresa Parish Variation

Stakeholders along St. Theresa Avenue requested an alternative that would avoid conflict with access to the St. Theresa Parish and School and The Roxbury Latin School. As a result of discussions with National Grid and several stakeholders along St. Theresa Avenue, Algonquin incorporated a route variation into the proposed route that relocates the end point of the West Roxbury Lateral to the north side of the intersection of Spring Street and Centre Street where the West Roxbury Lateral would connect to the existing National Grid pipeline system. With this change, the West Roxbury Lateral would connect directly to the National Grid pipeline system, and Algonquin would no longer require the buried vault-type of installation initially proposed. As shown in table 3.5.2-6 and on figure 3.5.2-7, the variation would eliminate about 375 feet of the previously proposed route along St. Theresa Avenue, which serves as the primary entrance road for both St. Theresa Parish and School and The Roxbury Latin School, and as a result, no portion of St. Theresa Avenue would be impacted by construction. According to Algonquin, it has discussed this route variation with representatives of both St. Theresa Parish and the Roxbury Latin School and it addresses these organizations' concerns regarding the potential impacts on their facilities. The route variation would also reduce the construction workspace by 0.5 acre. Because of these advantages, we find the St. Theresa Parish and School Variation to be preferable to the corresponding segment of the previously proposed route and agree with its incorporation into the West Roxbury Lateral pipeline route.

TABLE 3.5.2-6 Comparison of the St. Theresa Parish Variation to the Corresponding Segment of the Previously Filed Route for the AIM Project			
Environmental/Engineering Factor	Unit	Previously Filed Route	Variation (Currently Proposed Route)
Length (MPs 5.06 to 5.10)	miles	0.07	0.01
Land temporarily affected during construction	acres	0.81	0.31
New land permanently affected for operation	acres	0	0
Number of residences within 50 feet <sup>a</sup>	number	0	0
Wetlands affected	acres	0	0
Waterbody crossings	number	0	0
Road crossings	number	2	1
<sup>a</sup> Although no residences are located within 50 feet of the variation or the filed route, the variation would avoid one commercial structure and one church that are located within 50 feet of the filed route.			

### 3.5.2.3 Summary of Route Alternatives and Variations Evaluated After Issuance of the Draft EIS

Table 3.5.2-7 summarizes the route alternatives and variations evaluated after issuance of the draft EIS and whether they were incorporated into the proposed route. For those that have been incorporated into the proposed route, the analysis in section 4 of this EIS reflects those modifications.

TABLE 3.5.2-7

**Summary of Route Alternatives and Variations Evaluated After Issuance of the Draft EIS**

Alternative/Variation	Milepost Range	Incorporated Into Proposed Route
<b>Stony Point to Yorktown Take-up and Relay</b>		
Hudson River HDD Variation	3.0 to 4.0	Yes
Blue Mountain Reservation Variation	7.97 to 8.01	No
Catskill Aqueduct Variation	10.2 to 10.3	Yes
<b>West Roxbury Lateral</b>		
Neponset River State Park and Stony Brook State Reservation Alternative	0.0 to 5.1	No
Norfolk Golf Club Variation	0.0 to 0.2	Yes
Massachusetts Bay Transit Authority Variation	0.6 to 1.1	Yes
Gonzalez Field Variation	2.4 to 2.7	Yes
Mother Brook Route Variation	3.0 to 3.8	Yes
St. Theresa Parish and School Variation	5.07 to 5.08	Yes

### 3.5.3 Minor Pipeline Shifts, Workspace Adjustments, and Design Modifications Evaluated After the Draft EIS

In addition to route alternatives and variations, several pipeline shifts, workspace adjustments, and design modifications were proposed by Algonquin or suggested by commentors after issuance of the draft EIS. Our assessment of these adjustments and modifications is included in table 3.5.3-1 below. For those that have been incorporated into the proposed Project design, the analysis in section 4 of this EIS reflects those modifications.

### 3.5.4 Alternative Construction Methods Evaluated After Issuance of the Draft EIS

We received comments asking us to evaluate different construction methods for various waterbody and wetland crossings. Our evaluation is included below.

#### 3.5.4.1 Hudson River

We received comments on the draft EIS asking why we did not analyze alternative crossing methods for the proposed Hudson River crossing but instead limited our review to the HDD crossing method. Other alternatives were not thoroughly evaluated because we do not believe an alternative crossing method would offer any significant environmental advantages. The HDD method is recognized as the environmentally preferred method, and is now becoming industry standard, for crossing large and sensitive waterbodies, if conditions allow, because it installs the pipeline beneath the waterbody without impacting the bed or banks. An alternative to using the HDD method would be an open-cut crossing (other dry crossing methods such as a dam-and-pump or flume would not be practicable due to the size of the river). The impacts of the open-cut construction method would include water quality impacts associated with clearing, grading, and trenching within and adjacent to the river. Sediments would be suspended by in-water construction activities and there would be an increased potential for erosion of cleared river banks and riparian areas. Turbidity resulting from the sediments suspended during in-water trenching and backfilling operations could reduce light penetration and the corresponding photosynthetic oxygen production. The resuspension of deposited organic material and inorganic sediments could also cause an increase in consumption of biological and chemical oxygen, decreasing available dissolved oxygen. Based on these effects and the potential to avoid these effects using the HDD method, we did not consider an open-cut crossing of the Hudson River preferable.

TABLE 3.5.3-1

**Minor Pipeline Shifts, Workspace Adjustments, and Design Modifications Evaluated After Issuance of the Draft EIS**

Segment/ Milepost(s)	Municipality, State	Type of Modification	Description and Evaluation	Incorporated Into Project Design
<b>Stony Point to Yorktown Take-up and Relay</b>				
4.0 to 4.3	Verplanck/ Cortlandt, NY	Hudson River HDD pullback workspace addition and temporary access road adjustment	As a result of the modifications to the proposed entry/exit location and slightly longer length of the Hudson River HDD described above, Algonquin proposes to add 50 feet of ATWS width along the north side of the previously proposed pullback workspace on the exit side of the HDD. Algonquin says the ATWS is necessary to accommodate the fabrication of four pullback pipe strings that would be necessary to complete the HDD. The ATWS would result in 1.6 acres of additional forest clearing impacts. Algonquin also proposes to reduce the length of TAR 4.4 on the east side of the river by 440 feet. The temporary access would terminate at the HDD pullback workspace and would no longer extend to 11th Street in Verplanck. Because we believe this additional workspace is required to facilitate the successful completion of the HDD, and because the revised temporary access road would reduce impacts, we concur with Algonquin's proposal to incorporate the proposed changes into the Project design.	Yes
5.7 to 5.9	Peekskill/ Cortlandt, NY	Pipeline shift	Algonquin proposes to abandon in-place about 1,003 feet of the existing 26-inch-diameter pipeline where it passes under Route 9 in Peekskill and Cortlandt, New York. The new pipeline and workspace would be offset about 20 feet north of the existing 26-inch-diameter pipeline between MPs 5.7 and 5.9. We believe the proposed offset, which would allow the existing pipeline under the roadway to be abandoned in-place, avoiding the roadway impacts that would result if the existing pipeline were removed, is preferable and concur with Algonquin's proposal to incorporate it into the proposed route.	Yes
6.6	Cortlandt, NY	Workspace adjustment	Algonquin proposes to reduce the proposed construction workspace on the north side of the existing right-of-way at MP 6.6 in Cortlandt, New York to minimize impact on a residence. In order to facilitate equipment access to the revised construction area, Algonquin proposes to add an additional 0.22 acre of ATWS, comprising 0.16 acre of forest land and 0.06 acre of residential land, on the south side of the existing right-of-way opposite the residence. Because the proposed workspace adjustments were made to minimize residential impacts, we believe Algonquin's proposed changes are justified and concur with Algonquin's proposal to incorporate them into the proposed Project design.	Yes
8.1	Cortlandt, NY	Workspace addition	Algonquin proposes to add an additional 0.22 acre of ATWS on the south side of the existing right-of-way at MP 8.1 in Cortlandt, New York to provide access from a temporary access road to the construction right-of-way, and to provide additional area for construction crew parking, and to maintain access to a parking area associated with a residence/home business adjacent to the work area. The ATWS would result in an additional 0.22 acre of impact comprising 0.05 acre of forest land and 0.17 acre of industrial land. We believe Algonquin's proposed use of the additional workspace is justified and concur with Algonquin's proposal to incorporate it into the proposed Project design.	Yes

TABLE 3.5.3-1 (cont'd)

**Minor Pipeline Shifts, Workspace Adjustments, and Design Modifications Evaluated After Issuance of the Draft EIS**

Segment/ Milepost(s)	Municipality, State	Type of Modification	Description and Evaluation	Incorporated Into Project Design
10.4	Cortlandt, NY	Workspace addition	Algonquin proposes to add an additional 0.15 acre of ATWS along the northern edge of the previously proposed depicted workspace at MP 10.43 in Cortlandt, New York to provide space to safely dismantle an existing deck structure associated with the Cortlandt Farm Market. According to Algonquin, this deck is in poor condition and is a safety hazard. Algonquin plans to replace the deck structure after the pipeline installation is complete. All of the land that would be affected by the ATWS is industrial land consisting of a parking lot. Because the proposed additional workspace would be used to facilitate safe construction of the pipeline, we believe is justified and concur with Algonquin's proposal to incorporate it into the proposed Project design.	Yes
<b>Southeast to MLV 19 Take-up and Relay</b>				
2.1	Danbury, CT	Relocating HDD entry/exit point	The USACE asked that consideration be given to relocating the HDD entry/exit point near MP 2.1 further to the east (in an upland area) to avoid and minimize wetland impact from temporary workspace (B13-SELR-W10). The potential to relocate the HDD entry point to the east was considered but determined that the upland area to the east is on a hill and use of this area would not accommodate the HDD drill rig and other equipment without significant cut and fill activities. The proposed entry location is in a wetland but the area is flat and would be restored following installation of the pipeline. For these reasons we do not believe moving the HDD entry location to the nearby upland area to the east would be preferable to the proposed location.	No
2.7	Danbury, CT	Workspace addition	At the request of the USACE and CTDEEP, Algonquin proposes to reduce the workspace at about MP 2.7 to avoid a vernal pool. Specifically, Algonquin proposes to reduce the temporary construction workspace consisting of forest land by about 0.025 acre. We concur with the rationale for this workspace adjustment and find it acceptable for inclusion into the proposed Project design.	Yes
<b>Line 36-A Loop Extension</b>				
0.8 to 0.9	Cromwell, CT	Pipeline shift and workspace adjustment	As a result of site visits with the USACE, Algonquin is proposing a pipeline and workspace shift between MPs 0.8 and 0.9 to minimize direct workspace impacts on the main channel of Dividend Brook in Cromwell, Connecticut. The previously proposed workspace was adjacent and parallel to the southern bank of Dividend Brook. This workspace would be relocated about 60 feet to the south to eliminate in-stream construction and workspace impact on Dividend Brook. The proposed modification would increase slightly the amount of construction workspace and temporary wetland impacts (mostly within the existing right-of-way) by 0.13 and 0.14 acre, respectively; however, it would completely avoid direct in-stream impacts on the main channel of Dividend Brook. Because of these advantages, we believe it would be preferable to the previously proposed route and workspace, and, therefore, we concur with Algonquin's proposal to incorporate this route and workspace adjustment into the proposed route and Project design.	Yes
1.3 to 1.4	Cromwell, CT	Pipeline shift and workspace adjustment	The USACE suggested that the route parallel with Dividend Brook (B13-CLR-S4) be relocated either south of the 30-inch-diameter pipeline or along the north side of Meadow Road. As a result of site visits with the USACE and in response to a landowner request, Algonquin is proposing a pipeline shift and	Yes

TABLE 3.5.3-1 (cont'd)

**Minor Pipeline Shifts, Workspace Adjustments, and Design Modifications Evaluated After Issuance of the Draft EIS**

Segment/ Milepost(s)	Municipality, State	Type of Modification	Description and Evaluation	Incorporated Into Project Design
			workspace adjustment between MPs 1.3 and 1.4 to avoid multiple crossings of Dividend Brook in Cromwell, Connecticut. The proposed pipeline and corresponding workspace adjustment would relocate the pipeline about 60 feet to the south of its previously proposed location. This shift would eliminate four separate crossings of Dividend Brook and the associated in-stream construction and workspace impacts that would result from these crossings. The pipeline shift and corresponding workspace adjustment would also minimize impact on a residence located north of Dividend Brook. The proposed modifications would increase the overall workspace needed by 0.5 acre and the temporary wetland impacts (mostly within the existing right-of-way) by 0.35 acre, but these effects would be more than offset by the reduction in impacts on Dividend Brook. For these reasons, we believe the proposed pipeline shift and workspace adjustment would be preferable to the previously proposed alignment and concur with Algonquin's proposal to incorporate this pipeline shift and workspace adjustment into the proposed route and Project design.	
<b>E-1 System Lateral Take-up and Relay</b>				
2.0 to 3.3	Lebanon, CT	Pipeline shift	The USACE suggested that the pipeline route between MPs 2.0 and 3.3 be rerouted to the south of Susquetonscut Brook to minimize wetland and waterway impacts and avoid two crossings of tributaries to Susquetonscut Brook (A13-ELR-W2 A13-ELR-W6, VP6, VP6A, A13-ELR-W7, VP7, and A13-ELR-W8). Algonquin does not propose to implement a variation that would avoid wetland A13-ELR-W2. However, as discussed below, Algonquin is proposing a workspace adjustment between MPs 2.7 and 2.8 to minimize direct impacts on the main channel of Susquetonscut Brook.	No
2.7 to 2.8	Lebanon, CT	Workspace adjustment	As a result of site visits with the USACE, Algonquin is proposing a workspace adjustment between MPs 2.7 and 2.8 to minimize direct impacts on the main channel of Susquetonscut Brook in Lebanon, Connecticut. The previously proposed workspace was located within and adjacent to the southern bank of Susquetonscut Brook. Algonquin plans to reduce the width of the workspace north of the proposed alignment from 50 to 25 feet to eliminate direct workspace impact on Susquetonscut Brook. To offset for the loss of the workspace on the north side, Algonquin would expand the workspace on the south side of the right-of-way by an equal amount (i.e., from 25 to 50 feet). Algonquin also proposes to utilize an additional 25- by 200-foot ATWS that would be located in an upland area to facilitate construction through an adjacent wetland (i.e., wetland A13-ELR-W6). The proposed adjustments would increase the total amount of workspace required by 0.1 acre, but would avoid impacts on Susquetonscut Brook, reduce the clearing of forest land, and decrease the impact on wetlands by 0.1 acre and forested wetlands by 0.3 acre. For these reasons, we believe the proposed workspace adjustments would be preferable to the previously proposed workspaces and concur with Algonquin's proposal to incorporate these adjustments into the proposed Project design.	Yes
4.0 to 4.3	Franklin, CT	Pipeline shift	The USACE indicated that there appears to be an opportunity to avoid and minimize impact on the wetland system between MPs 4.0 and 4.3 by relocating the pipeline route to the south (B13-ELR-W16). Any deviation to the south would reduce wetland impact, but would create a new right-of-way corridor	No

TABLE 3.5.3-1 (cont'd)

**Minor Pipeline Shifts, Workspace Adjustments, and Design Modifications Evaluated After Issuance of the Draft EIS**

Segment/ Milepost(s)	Municipality, State	Type of Modification	Description and Evaluation	Incorporated Into Project Design
6.7	Franklin, CT	Eliminating access road	and would increase the area of disturbance and forest clearing. Additionally, the area to the south of the proposed route is side-sloped and would require substantial cut and fill and blasting to create a level work surface to install the pipeline. This would further increase the area of impact and the challenge to restoring the right-of-way. For these reasons, we believe the proposed route would be preferable in this area.  The USACE suggested that either TAR 6.7 be eliminated or relocated to avoid a vernal pool. The area encompassing the road is currently under development as a golf course and residential community and the area where the access road would be located is already cleared. As a result, no tree clearing or only minor grading would be required for its use. Additionally, Algonquin would implement erosion controls to ensure the vernal pool is not impacted. For these reasons, we believe the use of the proposed TAR is appropriate.	No
6.9	Franklin, CT	Workspace adjustment	At the request of the USACE, Algonquin is proposing to reduce the workspace at MP 6.9 to avoid a wetland (i.e., wetland A13-ELR-W13) that contains an identified vernal pool. Algonquin would reduce the size of temporary construction workspace, which is forested, by about 0.03 acre. Because the workspace adjustment would avoid a wetland, we believe that it would be preferable to the previously proposed workspace, and concur with Algonquin's incorporation of it into the proposed Project design.	Yes
7.1	Franklin, CT	Workspace adjustment	At the request of the USACE, Algonquin is proposing to reduce the previously proposed temporary workspace at MP 7.1 to avoid a wetland (i.e., wetland B13-ELR-W23). Algonquin proposes to reduce the size of the temporary construction workspace, which is forested, by about 0.02 acre. Because the workspace adjustment would avoid a wetland, we believe that it would be preferable to the previously proposed workspace, and concur with Algonquin's incorporation of it into the proposed Project design.	Yes
8.5 to 8.6	Norwich, CT	Pipeline shift	Algonquin proposes to shift the pipeline alignment between MPs 8.5 and 8.6 in Norwich Connecticut near two large box culverts on Wisconsin Avenue. These culverts, which occupy about a 7-square-foot area, were installed as part of a road improvement project to route Elisha Brook under the improved roadway. Algonquin's existing 10-inch-diameter pipeline is to the south and avoids the culverts. Algonquin has determined that there is adequate space between the openings of the culverts and the existing pipeline to install and operate the proposed 16-inch-diameter pipe. This route adjustment would increase slightly the amount of temporary workspace required (by 0.08 acre) and the forest land and open land impacts by 0.02 acre and 0.06 acre respectively, but would minimize disturbance to the stream bed and provide a suitable location for the equipment to execute a dam-and-pump dry crossing technique. We believe the proposed route adjustment would be preferable to the previously proposed route, and concur with Algonquin's incorporation of it into the proposed route.	Yes

TABLE 3.5.3-1 (cont'd)

**Minor Pipeline Shifts, Workspace Adjustments, and Design Modifications Evaluated After Issuance of the Draft EIS**

Segment/ Milepost(s)	Municipality, State	Type of Modification	Description and Evaluation	Incorporated Into Project Design
<b>West Roxbury Lateral</b>				
0.0 to 4.2	Westwood, Dedham, West Roxbury, MA	Permanent right-of-way width reduction; 50 to 30 feet	Along the West Roxbury Lateral route, the majority of the pipeline would be constructed within roadways by permit and, thus, would not require any permanent easement for operations of the pipeline. In the remaining locations, Algonquin would acquire permanent easement rights from the property owners. As previously proposed, Algonquin reflected a 50-foot-wide permanent easement on its filed alignment sheets. For the proposed 16-inch-diameter pipeline, Algonquin has determined that it would only seek to acquire a 30-foot-wide permanent easement. This change would reduce the amount of permanent right-of-way required for the Project, which we believe would be preferable and, therefore, we agree with its incorporation into the proposed Project design.	Yes
0.3 to 0.4	Westwood, MA	Pipeline shift	During survey activities on the Meditech property in Westwood, Algonquin identified the presence of a drainage outfall between MPs 0.3 and 0.4. To avoid this outfall, Algonquin is proposing to shift the centerline of the pipeline about 10 feet to the south of the previously proposed pipeline alignment. Algonquin is not proposing any change to the construction workspace limits, just the location of the pipeline. Because this pipeline shift avoids existing underground utilities and there are no changes in the environmental impacts as a result of this shift, we concur with Algonquin's proposal to incorporate this pipeline shift into the proposed West Roxbury Lateral pipeline route.	Yes
1.1	Dedham, MA	Workspace addition	To facilitate access for emergency vehicles during construction as may be necessary, Algonquin proposes to use 0.04 acre of ATWS on the Fox TV property at MP 1.1 in Dedham. This ATWS would be located adjacent to Fox Drive within an existing parking lot, which is an industrial/commercial land use area. We concur with the rationale for this ATWS and find it acceptable for inclusion into the proposed Project design.	Yes
1.1 to 2.4	Dedham, MA	Pipeline shift in Providence Highway	Algonquin identified the MassDOT pipeline shift to address potential traffic impacts, minimize utility crossings, and eliminate direct impacts on the driveways along Providence Highway, which include two entrances off of Providence Highway into Legacy Place, and support a number of businesses. Shifting the pipeline location along Providence Highway, would also enable Algonquin to reduce the amount of temporary construction workspace required by about 2.5 acres. By staying entirely within Providence Highway, the pipeline shift would also enable Algonquin to eliminate the section of the previously proposed route and construction workspace that extended away from Providence Highway at MP 1.4 and crossed Legacy Boulevard and McNeil Way. To further reduce impacts, Algonquin would complete the installation of the pipeline within Providence Highway at night between 9:00 p.m. and 5:00 a.m. According to Algonquin, the District Director for MassDOT District 6 and his senior staff preferred the proposed pipeline shift because it would lessen the overall impact on traffic flow along Providence Highway while also minimizing utility crossings. Algonquin says that both Legacy Place and National Amusements have also acknowledged that the proposed shift in alignment would be preferable to the previously proposed route because it reduces the potential impacts on Legacy Place. Based on the	Yes

TABLE 3.5.3-1 (cont'd)

**Minor Pipeline Shifts, Workspace Adjustments, and Design Modifications Evaluated After Issuance of the Draft EIS**

Segment/ Milepost(s)	Municipality, State	Type of Modification	Description and Evaluation	Incorporated Into Project Design
2.6	Dedham, MA	Workspace addition	<p>advantages of minimizing impacts on access to Legacy Place, we agree that the MassDOT Pipeline Shift would be preferable and should be incorporated into the proposed West Roxbury Lateral pipeline route.</p> <p>To facilitate staging of equipment and materials needed for construction of the West Roxbury Lateral, Algonquin proposes to add 0.5 acre of additional temporary workspace on private property at MP 2.6 in Dedham. This additional workspace would be located at the intersection of East Street and High Street. The property, which could be classified as industrial/commercial land, is current vacant and does not contain any structures. We concur with the rationale for this ATWS and find it acceptable for inclusion into the proposed Project design.</p>	Yes
4.1 to 4.3	West Roxbury, MA	Pipeline shift in Grove Street	<p>During survey activities along Grove Street in West Roxbury, Algonquin identified the presence of a combined sewer line between MPs 4.1 and 4.3. To avoid this feature, Algonquin is proposing to shift the centerline of the pipeline about 5 feet to the north of the previously proposed pipeline alignment. Algonquin is not proposing any change to the construction workspace limits, just the location of the pipeline. Because this pipeline shift avoids existing underground combined sewer line and there are no changes in the environmental impacts as a result of this shift, we concur with Algonquin's proposal to incorporate this pipeline shift into the proposed West Roxbury Lateral pipeline route.</p>	Yes
4.4 to 5.0	West Roxbury, MA	Pipeline shift in Centre Street	<p>As a result of further consultation with National Grid, Algonquin has also agreed to shift the pipeline alignment within Centre Street from the intersection of Grove and Centre Streets to the vicinity of the relocated interconnection point with National Grid in order to minimize further the overall impacts on Centre Street. Currently, National Grid is installing a new 12-inch-diameter plastic pipeline within Centre Street in West Roxbury between about MPs 4.4 and 5.0. When this work is completed over the next several weeks, National Grid would abandon its existing 6-inch-diameter cast iron pipeline in place. As a result, National Grid would have two abandoned pipelines in Centre Street, a 6-inch-diameter cast iron pipeline and a 12-inch-diameter steel pipeline. Algonquin has coordinated with National Grid and has agreed to install the proposed 24-inch-diameter pipeline in the location of the abandoned 12-inch-diameter steel pipeline, thereby utilizing the same trench. By utilizing that existing trench, Algonquin would have greater certainty concerning its ability to avoid existing utilities and thereby minimize the overall construction-related impacts on Centre Street. No change in the filed construction workspace is required to accommodate this pipeline alignment shift. Because of the advantages of this pipeline shift, we agree with its incorporation into the proposed West Roxbury Lateral pipeline route.</p>	Yes

As discussed in other sections of the EIS, Algonquin has prepared an HDD Contingency Plan that identifies steps to be taken to minimize impacts if there is an inadvertent return of drilling fluid in or near the river. If such an inadvertent return were to occur, the impacts would still be less than an open-cut crossing. If for some reason the HDD effort should fail at the proposed location, Algonquin would be required to identify a new location for the crossing or new methodology, and request approval for the new location or methodology with all applicable agencies.

#### **3.5.4.2 Susquetonscut Brook**

In its comments on the draft EIS, the USACE indicated that impacts on the Susquetonscut Brook (B13-ELR-S5B) at MP 5.8 on the E-1 System Lateral Take-up and Relay could be avoided by conducting HDD installation at this location. Algonquin is currently conducting geotechnical surveys to determine the feasibility of an HDD across the brook and New England Central Railroad. We have concluded that the current proposed dry crossing method would not result in any significant impacts (see the analysis in sections 4.3.2 and 4.6.2). However, if an HDD proves feasible, impacts on the waterbody would be further reduced. Upon completion of the geotechnical surveys, and if they demonstrate that an HDD is feasible, Algonquin would be required to request approval for the new methodology with all applicable agencies.

#### **3.5.4.3 Mother Brook**

In its comments on the draft EIS, the USACE requested that Algonquin consider the feasibility of completing the crossing of Mother Brook (B13-WRL-S3) at MP 3.1 on the West Roxbury Lateral using the HDD method. As discussed in more detail above, Algonquin has determined that there is sufficient space above the box culvert that conveys Mother Brook under Washington Street to install the pipeline above the box culvert. Algonquin has proposed a variation that would relocate the pipeline crossing to this area and would avoid any disturbance to the brook (see section 3.5.2.2).

#### **3.5.4.4 Falls Brook**

In its comments on the draft EIS, the USACE requested that Algonquin evaluate the use of the HDD method to avoid impacts on Falls Brook around MP 0.8 on the E-1 System Lateral Loop Extension. Algonquin evaluated the potential to use the HDD crossing method to cross Falls Brook and determined it would be technically feasible. However, Algonquin does not believe that an HDD is warranted because the proposed dam-and-pump method (which is a dry crossing method) would have minimal impact on the brook. Using the dam-and-pump method, Algonquin estimates it can complete the crossing in 24 to 48 hours. In contrast, an HDD crossing would take 2 to 3 months and would require an equipment move-around, which would prolong construction and delay the restoration of the right-of-way. The USACE agrees that an HDD crossing is not warranted and that the proposed dam-and-pump method would have minimal impact on the brook. We also agree.

#### **3.5.4.5 Wetland B13-CLR-W2**

The USACE commented that an HDD appears feasible in the area of wetland B13-CLR-W2 between about MPs 0.7 and 0.9 of the Line-36A Loop Extension to avoid new wetland impacts. Alternatively, wetland impacts could be avoided or reduced by adopting a new route to the south of the existing 30-inch-diameter pipeline. Algonquin determined that an HDD would be technically feasible in this area but has concerns about the potential for inadvertent returns of drilling fluids to impact nearby water wells and, given the nature of the impact on the wetland and Algonquin's plan to mitigate the impacts through implementation of its E&SCP, Algonquin does not believe an HDD is warranted. However, as discussed in section 3.5.3, Algonquin is proposing to shift the pipeline alignment and workspace about 60 feet to the south between MPs 0.8 and 0.9, which would eliminate in-stream construction and workspace impacts on Dividend Brook. The USACE agrees that this would sufficiently minimize impacts and we also agree.

### **3.6 ABOVEGROUND FACILITY SITE ALTERNATIVES**

#### **3.6.1 Compressor and M&R Station Modifications**

Algonquin proposes to modify six existing compressor stations and 24 existing M&R stations along its mainline system in New York, Connecticut, Rhode Island, and Massachusetts. The modifications at the compressor stations would occur within the existing sites; the modifications at the meter stations would occur within or directly adjacent to the existing sites. Because the proposed modifications would occur at existing facilities along Algonquin's mainline system, no alternative sites were identified or evaluated. See section 3.4 above for discussions regarding facility design and siting considerations for the Project.

#### **3.6.2 New M&R Stations**

Algonquin proposes to construct three new M&R stations as part of the Project, one in Connecticut and two in Massachusetts. Information on site alternatives for each of these facilities is provided below.

##### **3.6.2.1 Oakland Heights M&R Station**

Algonquin proposes to construct the Oakland Heights M&R facility in the City of Norwich, New London County, Connecticut to deliver natural gas to NPU. The proposed station site is located adjacent to Algonquin's existing E-3 Lateral System along Oakland Heights Road (see figure 3.6.2-1). The site would allow NPU to provide natural gas service to an adjacent trailer park community currently serviced by propane, and provide an alternate feed to its distribution system in the area. The proximity of the site to Algonquin's existing lateral and the trailer park community would minimize the required length of the interconnecting pipeline needed by NPU to provide new delivery service to the trailer park community. Algonquin would maintain a 50-foot-wide forested buffer between the proposed facility and the trailer park as a visual screen from nearby houses. No impacts on wetlands would result from construction at the proposed site.

We evaluated two alternative sites (A and B) upstream of the proposed site for the Oakland Heights M&R Station (see figure 3.6.2-1). Alternative sites downstream of the proposed site were not considered because of flow dynamics on the system: a new site downstream of the trailer park community would require an upgrade of the existing E-3 Lateral from 4-inch-diameter to 12-inch-diameter pipeline to maintain the required pressure profile on the lateral.

Alternative Site A is located in a wooded lot just south of Algonquin's existing E-3 Lateral and about 0.2 mile west of the proposed station site. The primary advantage of this site, like the proposed site, is its proximity to the existing E-3 Lateral. However, this site would require longer interconnecting pipeline to provide delivery service to the trailer park community. The interconnecting pipeline would need to cross the existing E-3 Lateral as well as a steep draw and a forested wetland.

Alternative Site B is located in a wooded lot north of the existing E-3 Lateral and west of the trailer park community, about 0.1 mile west of the proposed station site. The primary advantage of Alternative Site B is its proximity to both the existing lateral and the trailer park community, which would limit the length of the required interconnecting pipeline. The primary disadvantage is that the site is located on a steep slope adjacent to a waterbody and nearby wetlands.

Based on the above discussion, the proposed site is strategically situated to interconnect with NPU's system for delivery service to the trailer park community. Use of the proposed site would avoid impacts on wetlands and eliminate the need to construct across or within steep terrain. Moreover, we note that Algonquin has stated that representatives of the City of Norwich are opposed to the alternative locations. For all these reasons, the alternative sites would not be preferable to or provide a significant environmental advantage over the proposed site.

### **3.6.2.2 Assonet M&R Station**

Algonquin proposes to construct the new Assonet M&R Station in the Town of Freetown, Bristol County, Massachusetts to deliver natural gas to NSTAR. The new M&R facility would be built adjacent to Algonquin's existing North Fall River M&R Station, west of South Main Street in Freetown. NSTAR is currently supplied natural gas from the North Fall River M&R Station pursuant to an agreement with Fall River. However, NSTAR now has enough gas deliveries in its service area to warrant a new gate station directly with Algonquin. NSTAR requested that the new meter station be sited as close as possible to the North Fall River M&R Station to minimize the amount of new distribution pipeline that would need to be installed.

Algonquin sited the proposed M&R facility adjacent to an existing aboveground facility as well as NSTAR's existing distribution system. The proposed site for the new meter station is located in an existing Algonquin easement that has been modified to include the new facility. No significant environmental features, such as wetlands or waterbodies, would be affected by construction at the proposed site. As a result, we have not identified any specific alternative sites for the proposed facility.

The proposed Assonet M&R Station has been strategically sited to leverage existing transmission and distribution systems and minimize impacts on the environment. Any alternative site along or in the vicinity of Algonquin's system in Bristol County, Massachusetts would require construction of aboveground facilities away from existing, aboveground, pipeline infrastructure. An alternative site additionally would require construction of a longer distribution pipeline by NSTAR, which would result in greater environmental impact than the proposed action.

### **3.6.2.3 West Roxbury M&R Station**

Algonquin proposes to construct the West Roxbury M&R Station at MP 4.2 of the proposed West Roxbury Lateral pipeline to deliver natural gas to Boston Gas (see figure 3.6.2-1). The proposed site for the new facility is located at the intersection of Centre Street and Grove Street on an undeveloped, partially forested tract adjacent to an active quarry operation. No wetlands, waterbodies, or businesses would be affected by construction of the M&R facility at this site.

Numerous commentors requested evaluation of an alternative site for the West Roxbury M&R station due to concerns about blasting impacts and general safety impacts with the proposed location. We evaluated a potential alternative site for the M&R Station at the point where the West Roxbury Lateral Alternative Route intersects the proposed route (i.e., at about MP 5.0 of the proposed route). The alternative site is located on residential land at the intersection of Centre Street and Alaric Street. Use of the site would require the purchase and demolition of an existing residence to provide sufficient space for the M&R facility. Construction at this site would also result in significant traffic impacts along Centre and Alaric Streets due to the limited space available for construction. Further, Algonquin provided an engineering analysis by a third-party geotechnical consultant that evaluated the potential impacts of blasting in the quarry on the West Roxbury Lateral and West Roxbury M&R Station (see more description of the analysis in section 4.1.4 of the EIS). This evaluation concluded that ground vibrations from blasting at the quarry would not be disruptive or damaging to the M&R station or the pipeline. We agree with the findings of this evaluation. For these reasons, we do not consider the alternative site technically feasible or environmental preferable to the proposed site. No other viable alternative sites were identified for the proposed West Roxbury M&R Station.

## **4.0 ENVIRONMENTAL ANALYSIS**

---

The environmental consequences of constructing and operating the proposed AIM Project would vary in duration and significance. Four levels of impact duration were considered: temporary, short term, long term, and permanent. Temporary impacts generally occur during construction with the resource returning to preconstruction condition almost immediately afterward. Short-term impacts could continue for up to 3 years following construction. Impacts were considered long term if the resource would require more than 3 years to recover. A permanent impact could occur as a result of any activity that modified a resource to the extent that it would not return to preconstruction conditions during the life of the project, such as the construction of an aboveground facility. We considered an impact to be significant if it would result in a substantial adverse change in the physical environment.

In this section, we discuss the affected environment, general construction and operational impact, and proposed mitigation for each resource. Algonquin, as part of its proposal, agreed to implement certain measures to reduce impacts. We evaluated Algonquin's proposed mitigation measures to determine whether additional measures are necessary to reduce impacts. These additional measures appear as bulleted, boldfaced paragraphs in the text. We will recommend that these measures be included as specific conditions to any authorization that the Commission may issue Algonquin.

Conclusions in this EIS are based on our analysis of the environmental impacts and the following assumptions:

- Algonquin would comply with all laws and regulations;
- the proposed facilities would be constructed as described in section 2.0 of this document; and
- Algonquin would implement the mitigation measures included in its application and supplemental filings to FERC.

### **4.1 GEOLOGY**

#### **4.1.1 Geologic Setting**

The proposed Project is located in the New England Upland and Seaboard Lowland sections of the New England physiographic province. Pipeline and aboveground facilities in New York and Connecticut, as well as the Burrillville Compressor Station in Rhode Island, would be located in the New England Upland section, which is characterized by rolling hills with streams located in rounded and well-graded valleys. Relief ranges from 100 to 1,000 feet in the more mountainous regions, including the Ramapo Mountains in New York, and the Bolton and Mohegan ranges in Connecticut (USGS, 1999).

The Haverstraw to Stony Point Take-up and Relay segment begins in the Ramapo Mountains of southeastern New York State in the Mahwah River Valley. The pipeline route starts along gentle slopes and continues to traverse along hills of moderate relief (less than 200 feet) and moderate slope. Elevations along this pipeline segment range from approximately 200 feet above mean sea level (msl) near Cedar Pond Brook to about 660 feet above msl on a hill near Rider Hill.

From Algonquin's existing Stony Point Compressor Station, the Stony Point to Yorktown Take-up and Relay segment extends about 12.3 miles to the Town of Yorktown, traversing areas of moderate to steep relief. The pipeline segment crosses Bensons Point and Buckberg Mountain (about 450 feet of relief) before descending to the western shore of the Hudson River. After crossing the Hudson River, the

pipeline segment continues eastward along gentle to moderate slopes, passing the Peekskill M&R Station and the Cortlandt M&R Station. Elevations across the segment range from sea level at the Hudson River to about 700 feet above msl on Buckberg Mountain.

From Algonquin's existing Southeast Compressor Station, the Southeast to MLV 19 Take-up and Relay segment traverses rolling hills with moderate slope. The pipeline segment continues along gentle slopes in the area of West Danbury, Connecticut and steep slopes on the east side of Interstate 84. The pipeline segment then crosses gentle to moderate slopes on the north side of a series of drumlins with moderate to steep slopes. Elevations across the segment range from about 300 feet above msl near Interstate 84 to about 720 feet above msl east of Sawmill Road.

The E-1 System Lateral Take-up and Relay segment starts by crossing Owunnegunset Hill over moderate to steep slopes. The pipeline segment continues across moderate to gentle side slopes along Susquetonscut Brook before crossing moderate to steep slopes over Meeting House Hill and Misery Hill (about 300 feet of relief). It then rises about 350 feet up Turkey Hill and traverses moderate slopes before reaching its terminus. Elevations across the segment range from about 220 feet above msl at the Central Vermont Railroad crossing to about 550 feet above msl on Owunnegunset Hill.

The Line 36-A Loop Extension segment crosses about 2.0 miles of flat to gently sloping land west of the Connecticut River. Elevations range from about 20 feet above msl at the Connecticut River to approximately 150 feet above msl near the existing Cromwell Compressor Station.

The E-1 System Lateral Loop segment begins at Algonquin's existing Montville M&R Station in a flat area on the southwestern side of Stony Brook. The pipeline segment crosses moderately sloping terrain with a steeper section on the south side of Cochegan Hill. Elevations along this segment range from about 20 feet above msl near the existing Montville M&R Station to about 320 feet above msl on top of Cochegan Hill.

The proposed facilities in Massachusetts would be located in the Seaboard Lowland section of the New England province. The section is lower in elevation and typically less hilly than the New England Upland section and has many small rivers and streams flowing along a land surface that slopes towards the ocean. The area was inundated by the ocean and large proglacial lakes during the last glacial retreat. Local relief is typically less than 200 feet in most places within this section (USGS, 1999). The West Roxbury Lateral traverses gently sloping land in a highly developed area along existing roadways. Elevations along this segment range between about 15 to 45 feet above msl.

Algonquin's existing and new aboveground facilities are primarily located in areas with gentle to moderate slopes. Exceptions to this type of topography include:

- Bensons Point near the Stony Point Compressor Station and M&R Station;
- drumlins near the Southeast Compressor Station and West Danbury M&R Station;
- Woodruff Hill near the Oxford Compressor Station;
- a hill near Hope River at the Chaplin Compressor Station; and
- hills near the Oakland Heights, Southbury, and Middletown M&R Stations.

Construction and operation of the Project facilities would not materially alter existing geologic conditions in the area. In addition, the overall effect of the Project on topography would be minor. The primary effects would be limited to construction activities and would include temporary disturbance to slopes within the right-of-way resulting from grading and trenching operations. Algonquin would minimize the impacts by returning contours to preconstruction conditions to the maximum extent practicable. This may not be the case at the aboveground facilities, where grading and filling may be required to create a safe and stable land surface to support the facility.

#### **4.1.2 Surficial Geology**

The landscape in the area of the proposed Project consists primarily of glacial till with intermittent bedrock outcrops, sand and gravel deposits, and fine-grained lacustrine and swamp sediment deposits. A review of surficial geology maps provided information regarding the nature of deposits expected in the Project area. Table 4.1.2-1 summarizes surficial geology in the vicinity of the proposed pipeline facilities.

The aboveground facilities in New York and Rhode Island are all located on till. The aboveground facilities in Connecticut are located on a variety of surficial geologic surfaces including till, sand and gravel, sand, and alluvium. The aboveground facilities in Massachusetts are located on a variety of surficial geologic surfaces including till or bedrock, sand and gravel, fine-grained deposits, and coarse glacial stratified deposits.

The overall effect of the Project on surface geology would be minor. The effects would mostly be limited to construction activities and would include temporary disturbance to surficial deposits within the right-of-way resulting from grading and trenching operations. Algonquin would minimize the impacts on surface geology by returning contours to preconstruction conditions to the maximum extent practicable immediately after construction. This may not be the case at the aboveground facilities, where grading and filling may be required to create a safe and stable land surface to support the facility.

#### **4.1.3 Bedrock Geology**

Bedrock geology of the AIM Project area is dominated by igneous and metamorphic rocks with limited amounts of carbonate rock. A review of bedrock geology maps provided information regarding the nature of units expected in the Project area. Tables L-1 and L-2 in appendix L summarize bedrock geology in the vicinity of the proposed pipeline and aboveground facilities, respectively.

The effect on bedrock geology would be minor. The primary effects would be associated with areas of shallow bedrock where rock would need to be removed during the construction of pipeline facilities. See section 4.1.6 for more information on areas of shallow bedrock and mitigation measures that would be taken during rock removal.

#### **4.1.4 Mineral Resources**

Mineral resources in the Project area consist mainly of commercial sand and gravel, crushed stone, and a gypsum quarry. Sands and gravels are commercially extracted from widely distributed glacial outwash deposits at locations in the general area of the Project. Upon review of the USGS topographic maps and recent aerial photography, three extraction facilities were found to be located in close proximity to the Project as described below.
